Third-party materials. If you wish to reuse material from this work that is attributed to a third party, such as tables, figures or images, it is your responsibility to determine whether permission is needed for that reuse and to obtain permission from the copyright holder. The risk of claims resulting from infringement of any third-party-owned component in the work rests solely with the user.

General disclaimers. The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by WHO to verify the information contained in this publication. However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall WHO be liable for damages arising from its use.

Correct use of ICD-11

Please refer to the reference guide for the correct use of ICD-11 (https://icdcdn.who.int/icd11referenceguide/en/html/index.html).

To prevent the dilution of ICD's purpose to provide a definitive standard for identifying health information, ICD-11 may not be used for the purpose of developing or promoting a different standard.

The use of ICD-11 in software products is subject to the following license: https://icd.who.int/en/docs/ICD11-license.pdf. Under the terms of this license, users may not:

- reproduce ICD-11 in part or whole and distribute it under a different name or without attribution;
- reproduce and distribute ICD-11 in part or whole without the ICD-11 codes;
- reproduce ICD-11 in part or whole without the ICD-11 URIs (not applicable for print publications).

Mappings or crosslinks between other classifications and terminologies and ICD-11 and/or translations are not covered by the ICD-11 license and are subject to a separate written agreement from WHO.

Adding data fields to ICD-11 concepts is permitted, provided such additions are clearly identified as additions that do not originate from WHO.

Suggestions for changes to ICD-11 should be submitted as a proposal to the ICD-11 maintenance platform (https://icd.who.int/en).

TABLE OF CONTENTS

CHAPTER 01 44

Certain infectious or parasitic diseases 44

Gastroenteritis or colitis of infectious origin (1A00-1A40.Z) 45

Bacterial intestinal infections (1A00-1A0Z) 45

Bacterial foodborne intoxications (1A10-1A1Z) 47

Viral intestinal infections (1A20-1A2Z) 48

Protozoal intestinal infections (1A30-1A3Z) 49

Predominantly sexually transmitted infections (1A60-1A9Z) 51

Syphilis (1A60-1A6Z) 51

Gonococcal infection (1A70-1A7Z) 54

Sexually transmissible infections due to chlamydia (1A80-1A8Z) 55

Mycobacterial diseases (1B10-1B2Z) 58

Tuberculosis (1B10-1B1Z) 58

Certain staphylococcal or streptococcal diseases (1B40-1B5Z) 63

Acute rheumatic fever (1B40-1B42) 63

Pyogenic bacterial infections of the skin or subcutaneous tissues (1B70-1B7Y) 66

Certain zoonotic bacterial diseases (1B90-1B9Z) 70

Other bacterial diseases (1C10-1C4Z) 73

Other diseases due to chlamydiae (1C20-1C2Z) 83

Rickettsioses (1C30-1C3Z) 84

Human immunodeficiency virus disease (1C60-1C62.Z) 87

Viral infections of the central nervous system (1C80-1C8Z) 91

Non-viral and unspecified infections of the central nervous system (1D00-1D0Z) 94

Dengue (1D20-1D2Z) 100

Certain arthropod-borne viral fevers (1D40-1D4Z) 100

Certain zoonotic viral diseases (1D60-1D6Z) 103

Certain other viral diseases (1D80-1E1Z) 107

Viral infection of unspecified site (1D90-1D9Z) 110

Influenza (1E30-1E32) 111

Viral hepatitis (1E50-1E5Z) 112

Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z) 115

Infections due to poxvirus (1E70-1E7Z) 115

Human papillomavirus infection of skin or mucous membrane (1E80-1E8Z) 117

Varicella zoster virus infections (1E90-1E91.Z) ... 118
Mycoses (1F20-1F2Z) ... 123
Parasitic diseases (1F40-1G2Z) ... 135
Malaria (1F40-1F4Z) ... 135
Nonintestinal protozoal diseases (1F50-1F5Z) ... 137
Helminthiases (1F60-1F9Z) ... 142
Diseases due to nematodes (1F60-1F6Z) ... 142
Diseases due to cestodes (1F70-1F7Z) ... 148
Diseases due to trematodes (1F80-1F8Z) ... 151
Infestations by ectoparasites (1G00-1G0Z) ... 154
Sepsis (1G40-1G41) ... 157
Sequelae of infectious diseases (1G80-1G8Y) ... 159
CHAPTER 02 ... 160
Neoplasms ... 160
Neoplasms of brain or central nervous system (2A00-2A0Z) ... 160
Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z) ... 163
Myeloproliferative neoplasms (2A20-2A22) ... 163
Myelodysplastic syndromes (2A30-2A3Z) ... 165
Myelodysplastic and myeloproliferative neoplasms (2A40-2A4Z) ... 166
Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1 (2A50-2A5Z) ... 167
Precursor lymphoid neoplasms (2A70-2A7Z) ... 171
Mature B-cell neoplasms (2A80-2A8Z) ... 171
Mature T-cell or NK-cell neoplasms (2A90-2B2Z) ... 178
Mature T-cell or NK-cell lymphomas and lymphoproliferative disorders, primary cutaneous specified types (2B00-2B0Z) ... 180
Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2E2Z) ... 184
Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2D3Z) ... 184
Malignant mesenchymal neoplasms (2B50-2B5Z) ... 184
Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Z) ... 190
Malignant neoplasms of digestive organs (2B70-2C1Z) ... 195
Malignant neoplasms of intestine (2B80-2C0Z) ... 197
Malignant neoplasms of large intestine (2B90-2B9Y) ... 199

Malignant neoplasms of middle ear, respiratory or intrathoracic organs (2C20-2C2Z) 205
Malignant neoplasms of skin (2C30-2C3Z) 210
Malignant neoplasms of peripheral nerves or autonomic nervous system (2C40-2C4Z) 213
Malignant neoplasms of retroperitoneum, peritoneum or omentum (2C50-2C5Z) 213
Malignant neoplasms of breast (2C60-2C6Z) 215
Malignant neoplasms of female genital organs (2C70-2C7Z) 216
Malignant neoplasms of male genital organs (2C80-2C8Z) 221
Malignant neoplasms of urinary tract (2C90-2C9Z) 223
Malignant neoplasms of eye or ocular adnexa (2D00-2D0Z) 226
Malignant neoplasms of endocrine glands (2D10-2D1Z) 228
Malignant neoplasms of ill-defined or unspecified primary sites (2D40-2D4Z) 231
Malignant neoplasm metastases (2D50-2E2Z) 231
Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z) 231
Malignant neoplasm metastasis in thoracic or respiratory organs (2D70-2D7Z) 232
Malignant neoplasm metastasis in digestive system (2D80-2D8Z) 232
Malignant neoplasm metastasis in retroperitoneum or peritoneum (2D90-2D91) 233
Malignant neoplasm metastasis in other sites (2E00-2E0Y) 233
In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E60-2E6Z) 234
Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E80-2F5Z) 240
Benign mesenchymal neoplasms (2E80-2E8Z) 240
Benign non-mesenchymal neoplasms (2E90-2F3Z) 244
Benign neoplasm of respiratory or intrathoracic organs (2F00-2F0Z) 247
Benign cutaneous neoplasms (2F20-2F2Z) 247
Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F70-2F7Z) 253
Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F90-2F9Z) 255
CHAPTER 03 256
Diseases of the blood or blood-forming organs 256
Anaemias or other erythrocyte disorders (3A00-3A9Z) 257
Nutritional or metabolic anaemias (3A00-3A03.Y) 257
Haemolytic anaemias (3A10-3A4Z) 261
Congenital haemolytic anaemia (3A10-3A1Y) 261

Acquired haemolytic anaemia (3A20-3A2Z) 262
Pure red cell aplasia (3A60-3A6Z) 268
Polycythaemia (3A80-3A8Z) 272
Coagulation defects, purpura or other haemorrhagic or related conditions (3B10-3B6Z) 274
Coagulation defects (3B10-3B4Z) 274
Congenital or constitutional haemorrhagic condition (3B10-3B1Z) 274
Haemorrhagic diseases due to acquired coagulation factor defects (3B20-3B2Y) 276
Fibrinolytic defects (3B50-3B51) 277
Diseases of spleen (3B80-3B8Z) 283
CHAPTER 04 287
Diseases of the immune system 287
Primary immunodeficiencies (4A00-4A0Z) 287
Nonorgan specific systemic autoimmune disorders (4A40-4A4Z) 291
Autoinflammatory disorders (4A60-4A6Z) 300
Allergic or hypersensitivity conditions (4A80-4A8Z) 302
Immune system disorders involving white cell lineages (4B00-4B0Z) 309
Certain disorders involving the immune system (4B20-4B2Y) 311
CHAPTER 05 314
Endocrine, nutritional or metabolic diseases 314
Endocrine diseases (5A00-5B3Z) 314
Disorders of the thyroid gland or thyroid hormones system (5A00-5A0Z) 314
Diabetes mellitus (5A10-5A2Y) 319
Acute complications of diabetes mellitus (5A20-5A2Y) 321
Other disorders of glucose regulation or pancreatic internal secretion (5A40-5A4Z) 323
Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z) 324
Disorders of the pituitary hormone system (5A60-5A6Z) 326
Disorders of the adrenal glands or adrenal hormone system (5A70-5A7Z) 329
Disorders of the gonadal hormone system (5A80-5A8Z) 332
Certain disorders of puberty (5A90-5A9Z) 334
Polyglandular dysfunction (5B00-5B0Z) 335
Endocrine disorders, not elsewhere classified (5B10-5B1Y) 335
Nutritional disorders (5B50-5C3Z) 336
Undernutrition (5B50-5B7Z) 336
Sequelae of malnutrition or certain specified nutritional deficiencies (5B60-5B6Z) 347

Overweight, obesity or specific nutrient excesses (5B80-5C1Z) 348
Overweight or obesity (5B80-5B81.Z) 348
Certain specified nutrient excesses (5B90-5B9Z) 350
Metabolic disorders (5C50-5D2Z) 353
Inborn errors of metabolism (5C50-5C5Z) 353
Disorders of metabolite absorption or transport (5C60-5C6Z) 370
Disorders of fluid, electrolyte or acid-base balance (5C70-5C7Z) 376
Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z) 378
Other metabolic disorders (5D00-5D0Y) 381
Postprocedural endocrine or metabolic disorders (5D40-5D46) 383
CHAPTER 06 385
Mental, behavioural or neurodevelopmental disorders 385
Neurodevelopmental disorders (6A00-6A0Z) 386
Schizophrenia or other primary psychotic disorders (6A20-6A2Z) 397
Catatonia (6A40-6A4Z) 406
Mood disorders (6A60-6A8Z) 408
Bipolar or related disorders (6A60-6A6Z) 408
Depressive disorders (6A70-6A7Z) 417
Anxiety or fear-related disorders (6B00-6B0Z) 426
Obsessive-compulsive or related disorders (6B20-6B2Z) 429
Disorders specifically associated with stress (6B40-6B4Z) 434
Dissociative disorders (6B60-6B6Z) 437
Feeding or eating disorders (6B80-6B8Z) 443
Elimination disorders (6C00-6C0Z) 447
Disorders of bodily distress or bodily experience (6C20-6C2Z) 449
Disorders due to substance use or addictive behaviours (6C40-6C5Z) 451
Disorders due to substance use (6C40-6C4Z) 451
Disorders due to addictive behaviours (6C50-6C5Z) 552
Impulse control disorders (6C70-6C7Z) 555
Disruptive behaviour or dissocial disorders (6C90-6C9Z) 557
Personality disorders and related traits (6D10-6D11.5) 560
Paraphilic disorders (6D30-6D3Z) 563
Factitious disorders (6D50-6D5Z) 565
Neurocognitive disorders (6D70-6E0Z) 566

Dementia (6D80-6D8Z) 571
Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z) 581
Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z) 584
CHAPTER 07 592
Sleep-wake disorders 592
Insomnia disorders (7A00-7A0Z) 593
Hypersomnolence disorders (7A20-7A2Z) 594
Sleep-related breathing disorders (7A40-7A4Z) 597
Circadian rhythm sleep-wake disorders (7A60-7A6Z) 603
Sleep-related movement disorders (7A80-7A8Z) 605
Parasomnia disorders (7B00-7B0Z) 607
CHAPTER 08 611
Diseases of the nervous system 611
Movement disorders (8A00-8A0Z) 612
Disorders with neurocognitive impairment as a major feature (8A20-8A2Z) 623
Multiple sclerosis or other white matter disorders (8A40-8A4Z) 624
Epilepsy or seizures (8A60-8A6Z) 631
Headache disorders (8A80-8A8Z) 639
Cerebrovascular diseases (8B00-8B2Z) 642
Intracranial haemorrhage (8B00-8B0Z) 642
Cerebral ischaemia (8B10-8B1Z) 644
Spinal cord disorders excluding trauma (8B40-8B4Z) 653
Motor neuron diseases or related disorders (8B60-8B6Z) 655
Disorders of nerve root, plexus or peripheral nerves (8B80-8C4Z) 658
Disorders of cranial nerves (8B80-8B8Z) 658
Nerve root or plexus disorders (8B90-8B9Z) 660
Polyneuropathy (8C00-8C0Z) 661
Mononeuropathy (8C10-8C1Z) 663
Hereditary neuropathy (8C20-8C2Z) 665
Diseases of neuromuscular junction or muscle (8C60-8D0Z) 667
Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z) 667
Primary disorders of muscles (8C70-8C7Z) 668

Secondary myopathies (8C80-8C8Z) 675
Cerebral palsy (8D20-8D2Z) 677
Nutritional or toxic disorders of the nervous system (8D40-8D4Z) 679
Disorders of cerebrospinal fluid pressure or flow (8D60-8D6Z) 682
Disorders of autonomic nervous system (8D80-8D8Z) 685
Human prion diseases (8E00-8E0Z) 688
Disorders of consciousness (8E20-8E2Z) 689
Other disorders of the nervous system (8E40-8E4Y) 690
Postprocedural disorders of the nervous system (8E60-8E66) 695
CHAPTER 09 697
Diseases of the visual system 697
Disorders of the ocular adnexa or orbit (9A00-9A4Z) 698
Disorders of eyelid or peri-ocular area (9A00-9A0Z) 698
Disorders of lacrimal apparatus (9A10-9A1Z) 704
Disorders of orbit (9A20-9A2Z) 705
Disorders of the eyeball - anterior segment (9A60-9B3Z) 708
Disorders of conjunctiva (9A60-9A6Z) 708
Disorders of the cornea (9A70-9A7Z) 711
Disorders of the anterior chamber (9A80-9A8Z) 714
Disorders of the anterior uvea (9A90-9A9Z) 714
Functional disorders of the pupil (9B00-9B0Z) 716
Disorders of lens (9B10-9B1Z) 717
Disorders of the eyeball - posterior segment (9B50-9C0Z) 719
Disorders of sclera (9B50-9B5Z) 719
Disorders of the choroid (9B60-9B6Z) 720
Disorders of the retina (9B70-9B7Z) 721
Disorders of the vitreous body (9B80-9B8Z) 728
Disorders of the eyeball affecting both anterior and posterior segments (9C20-9C2Z) 728
Disorders of the visual pathways or centres (9C40-9C4Z) 729
Glaucoma or glaucoma suspect (9C60-9C6Z) 731
Strabismus or ocular motility disorders (9C80-9C8Z) 736
Disorders of refraction or accommodation (9D00-9D0Z) 741
Postprocedural disorders of eye or ocular adnexa (9D20-9D25) 742
Impairment of visual functions (9D41-9D7Z) 743

Subjective visual experiences (9D50-9D5Z) 745
Vision impairment (9D90-9D9Z) 746
CHAPTER 10 749
Diseases of the ear or mastoid process 749
Diseases of external ear (AA00-AA6Z) 750
Infectious diseases of external ear (AA00-AA0Z) 750
Otitis externa (AA10-AA3Z) 751
Noninfectious inflammation of external ear (AA10-AA1Z) 751
Noninflammatory disorders of the external ear (AA40-AA4Z) 752
Diseases of middle ear or mastoid (AA80-AB1Z) 753
Otitis media (AA80-AB0Z) 753
Nonsuppurative otitis media (AA80-AA8Z) 753
Suppurative otitis media (AA90-AA9Z) 753
Diseases of inner ear (AB30-AB3Z) 757
Disorders with hearing impairment (AB50-AB5Z) 761
Disorders of ear, not elsewhere classified (AB70-AB7Y) 762
Postprocedural disorders of ear or mastoid process (AB90-AB93) 763
CHAPTER 11 764
Diseases of the circulatory system 764
Hypertensive diseases (BA00-BA04.Z) 765
Hypotension (BA20-BA2Z) 767
Ischaemic heart diseases (BA40-BA6Z) 767
Acute ischaemic heart disease (BA40-BA4Z) 767
Chronic ischaemic heart disease (BA50-BA5Z) 769
Diseases of coronary artery (BA81-BA8Z) 772
Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z) 773
Pericarditis (BB20-BB2Z) 776
Acute or subacute endocarditis (BB40-BB4Z) 777
Heart valve diseases (BB60-BC0Z) 778
Mitral valve disease (BB60-BB6Z) 778
Aortic valve disease (BB70-BB7Z) 780
Tricuspid valve disease (BB80-BB8Z) 781
Pulmonary valve disease (BB90-BB9Z) 782
Diseases of the myocardium or cardiac chambers (BC40-BC4Z) 786

Cardiac arrhythmia (BC60-BC9Z) 793
Ventricular rhythm disturbance (BC70-BC7Z) 795
Supraventricular rhythm disturbance (BC80-BC8Z) 796
Heart failure (BD10-BD1Z) 800
Diseases of arteries or arterioles (BD30-BD5Z) 801
Chronic arterial occlusive disease (BD40-BD4Z) 802
Diseases of veins (BD70-BD7Z) 808
Disorders of lymphatic vessels or lymph nodes (BD90-BD9Z) 812
Postprocedural disorders of circulatory system (BE10-BE1F.1) 815
CHAPTER 12 820
Diseases of the respiratory system 820
Upper respiratory tract disorders (CA00-CA0Z) 821
Certain lower respiratory tract diseases (CA20-CA2Z) 831
Lung infections (CA40-CA4Z) 838
Lung diseases due to external agents (CA60-CA8Z) 845
Pneumonitis (CA70-CA7Z) 847
Respiratory diseases principally affecting the lung interstitium (CB00-CB0Z) 851
Pleural, diaphragm or mediastinal disorders (CB20-CB2Z) 858
Postprocedural disorders of the respiratory system (CB60-CB64) 863
CHAPTER 13 865
Diseases of the digestive system 865
Diseases or disorders of orofacial complex (DA00-DA0Z) 866
Diseases of oesophagus (DA20-DA2Z) 883
Diseases of the stomach or the duodenum (DA40-DA7Z) 891
Diseases of stomach (DA40-DA4Y) 891
Diseases of duodenum (DA50-DA5Y) 897
Ulcer of stomach or duodenum (DA60-DA63.Z) 900
Diseases of small intestine (DA90-DA9Z) 904
Diseases of appendix (DB10-DB1Z) 912
Diseases of large intestine (DB30-DB3Z) 914
Diseases of anal canal (DB50-DB7Z) 921
Acquired anatomical alterations of the anal canal (DB50-DB5Z) 921
Haemorrhoids or perianal venous conditions (DB60-DB6Z) 923
Diseases of liver (DB90-DB9Z) 926

Diseases of gallbladder or biliary tract (DC10-DC1Z) 937
Diseases of pancreas (DC30-DC3Z) 940
Diseases of peritoneum (DC50-DC5Z) 943
Diverticular disease of intestine (DC70-DD1Z) 945
Diverticular disease of small intestine (DC70-DC72.Z) 945
Diverticular disease of large intestine (DC80-DC82.Z) 947
Diverticular disease of intestine of overlapping sites (DC90-DC90) 948
Diverticular disease of unspecified part of intestine (DD00-DD02.Z) 948
Ischaemic vascular disorders of intestine (DD30-DD3Z) 949
Hernias (DD50-DD5Z) 950
Inflammatory bowel diseases (DD70-DD7Z) 952
Functional gastrointestinal disorders (DD90-DD9Z) 954
Postprocedural disorders of digestive system (DE10-DE13) 959
CHAPTER 14 961
Diseases of the skin 961
Certain skin disorders attributable to infection or infestation (EA00-EA6Y) 962
Certain skin disorders attributable to viral infection (EA00-EA3Z) 962
Viral exanthems (EA00-EA0Y) 962
Certain dermatoses with suspected viral aetiology (EA10-EA12) 963
Dermatoses from distant or systemic viral infection (EA20-EA20) 963
Certain skin disorders attributable to bacterial infection (EA40-EA5Z) 964
Predominantly tropical or subtropical bacterial infections affecting skin (EA40-EA40) 964
Inflammatory dermatoses (EA80-EB7Y) 967
Dermatitis and eczema (EA80-EA8Z) 967
Papulosquamous dermatoses (EA90-EA95) 973
Urticaria, angioedema and other urticarial disorders (EB00-EB0Y) 977
Inflammatory erythemas and other reactive inflammatory dermatoses (EB10-EB31) 979
Neutrophilic dermatoses (EB20-EB2Y) 981
Immunobullous diseases of the skin (EB40-EB4Y) 982
Cutaneous lupus erythematosus (EB50-EB5Z) 985
Scarring or sclerosing inflammatory dermatoses (EB60-EB61.Y) 986
Metabolic and nutritional disorders affecting the skin (EB90-EB9Y) 987
Genetic and developmental disorders affecting the skin (EC10-EC7Y) 991
Genetic syndromes affecting the skin (EC10-EC1Y) 991

Genetically-determined epidermolysis bullosa (EC30-EC3Z) 995
Genetic disorders affecting dermal collagen, elastin or other matrix proteins (EC40-EC4Y) 996
Specified developmental anomalies affecting the skin (EC50-EC5Y) 996
Sensory and psychological disorders affecting the skin (EC90-ED3Y) 997
Disturbances of cutaneous sensation (EC90-EC9Y) 997
Psychological or psychiatric conditions affecting the skin (ED00-ED2Y) 999
Self-inflicted skin disorders (ED00-ED0Y) 999
Neurological conditions affecting the skin (ED30-ED3Y) 1000
Skin disorders involving specific cutaneous structures (ED50-EG02) 1001
Disorders of the epidermis and epidermal appendages (ED50-EE21) 1001
Disorders of epidermal keratinisation (ED50-ED5Y) 1001
Disorders of skin colour (ED60-ED6Y) 1003
Disorders of hair (ED70-ED7Y) 1006
Disorders of the hair follicle (ED80-ED9Y) 1009
Acne and related disorders (ED80-ED81.Y) 1009
Disorders of eccrine sweat glands or sweating (EE00-EE0Y) 1013
Disorders of the nail or perionychium (EE10-EE1Z) 1014
Disorders of epidermal integrity (EE20-EE21) 1017
Disorders of the dermis and subcutis (EE40-EF0Y) 1018
Disorders of cutaneous connective tissue (EE40-EE7Y) 1018
Poikiloderma (EE50-EE50) 1019
Fibromatoses and keloids (EE60-EE6Y) 1020
Histiocytic-granulomatous disorders of the skin (EE80-EE8Y) 1021
Benign dermal lymphocytic or lymphoplasmacytic infiltrations or proliferations (EE90-EE91) 1022
Disorders of subcutaneous fat (EF00-EF0Y) 1022
Disorders of cutaneous blood and lymphatic vessels (EF20-EG02) 1024
Malformations involving cutaneous blood vessels (EF20-EF2Z) 1024
Purpura or bruising (EF30-EF3Z) 1025
Dermatoses attributable to hyperviscosity or microvascular occlusion (EF50-EF5Y) 1026
Dermatoses resulting from vascular insufficiency (EF60-EF9Y) 1026
Dermatoses due to venous disease (EF70-EF7Z) 1027
Functional vascular disorders of the skin (EG00-EG02) 1027
Skin disorders involving certain specific body regions (EG30-EG9Z) 1028

Skin disorders involving the head and neck (EG30-EG4Z) 1028
Disorders of the external ear involving the skin (EG40-EG4Z) 1029
Inflammatory disorders of the external ear (EG40-EG4Z) 1029
Skin disorders involving the genital and perianal regions (EG60-EG7Y) 1029
Dermatoses of the anus, perianal area or perineum (EG60-EG63.2) 1029
Skin disorders associated with pregnancy, the neonatal period and infancy (EH10-EH40.Y) 1031
Skin disorders specific to the perinatal or neonatal period (EH10-EH3Y) 1031
Neonatal skin infection (EH10-EH1Z) 1031
Adverse cutaneous reactions to medication (EH60-EH7Z) 1033
Drug eruptions (EH60-EH6Z) 1033
Skin disorders provoked by external factors (EH90-EK5Y) 1038
Dermatoses provoked or exacerbated by exposure to cold (EJ0Y-EJ0Y) 1040
Dermatoses provoked by heat or electricity (EJ10-EJ1Y) 1041
Dermatoses provoked by light or UV radiation (EJ20-EJ6Y) 1041
Chronic effects of ultraviolet radiation on the skin (EJ20-EJ2Y) 1041
Acute effects of ultraviolet radiation on normal skin (EJ40-EJ4Z) 1042
Dermatoses due to ionizing radiation (EJ71-EJ7Z) 1043
Phototoxic reactions to skin contact with photoactive agents (EK20-EK2Z) 1048
Benign proliferations, neoplasms and cysts of the skin (EK70-EK71.Z) 1049
Disorders of the skin of uncertain or unpredictable malignant potential (EK90-EK92) 1051
Cutaneous markers of internal disorders (EL10-EL3Y) 1053
Cutaneous markers of internal malignancy (EL10-EL1Y) 1053
Postprocedural disorders of the skin (EL50-EL80) 1053
Adverse cutaneous effects of therapeutic ionizing irradiation (EL60-EL63) 1054
Complications of cutaneous cosmetic procedures (EL73-EL73.6) 1055
CHAPTER 15 1056
Diseases of the musculoskeletal system or connective tissue 1056
Arthropathies (FA00-FA5Z) 1057
Osteoarthritis (FA00-FA0Z) 1057
Infection related arthropathies (FA10-FA1Z) 1058
Inflammatory arthropathies (FA20-FA2Z) 1060
Certain specified joint disorders or deformities of limbs (FA30-FA3Z) 1065
Conditions associated with the spine (FA70-FB1Z) 1070
Structural disorders of spine (FA70-FA7Z) 1070

Degenerative condition of spine (FA80-FA8Z) 1071
Inflammation of spine (FA90-FA9Z) 1074
Spondylopathies (FB00-FB0Z) 1075
Soft tissue disorders (FB30-FB6Z) 1076
Disorders of muscles (FB30-FB3Z) 1076
Disorders of synovium or tendon (FB40-FB4Z) 1078
Miscellaneous specified soft tissue disorders (FB50-FB56.6) 1080
Osteopathies or chondropathies (FB80-FB8Z) 1084
CHAPTER 16 1091
Diseases of the genitourinary system 1091
Diseases of the female genital system (GA00-GA6Z) 1092
Inflammatory disorders of the female genital tract (GA00-GA0Z) 1092
Noninflammatory disorders of female genital tract (GA12-GA1Z) 1098
Abnormal uterine or vaginal bleeding (GA20-GA2Z) 1104
Dermatoses of female genitalia (GA40-GA4Y) 1113
Diseases of the male genital system (GA80-GB0Z) 1115
Dermatoses of male genitalia (GA80-GA81.Y) 1115
Diseases of prostate (GA90-GA91.Z) 1116
Disorders of breast (GB20-GB2Z) 1123
Diseases of the urinary system (GB40-GC2Z) 1125
Glomerular diseases (GB40-GB4Z) 1125
Renal tubulo-interstitial diseases (GB50-GB5Z) 1127
Kidney failure (GB60-GB6Z) 1130
Urolithiasis (GB70-GB7Z) 1132
Cystic or dysplastic kidney disease (GB80-GB8Z) 1134
Certain specified diseases of urinary system (GC00-GC0Y) 1139
Other conditions of the genitourinary system (GC40-GC51.Z) 1145
Female pelvic floor dysfunction (GC40-GC4Z) 1145
Postprocedural disorders of genitourinary system (GC70-GC7B) 1151
CHAPTER 17 1153
Conditions related to sexual health 1153
Sexual dysfunctions (HA00-HA0Z) 1153
Sexual pain disorders (HA20-HA2Z) 1159
Gender incongruence (HA60-HA6Z) 1161

CHAPTER 18 1163
Pregnancy, childbirth or the puerperium 1163
Abortive outcome of pregnancy (JA00-JA0Z) 1163
Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z) 1169
Obstetric haemorrhage (JA40-JA4Z) 1172
Certain specified maternal disorders predominantly related to pregnancy (JA60-JA6Z) 1174
Maternal care related to the fetus, amniotic cavity or possible delivery problems (JA80-JA8Z) 1180
Complications of labour or delivery (JB00-JB0Z) 1185
Delivery (JB20-JB2Z) 1194
Complications predominantly related to the puerperium (JB40-JB4Z) 1196
Certain obstetric conditions, not elsewhere classified (JB60-JB6Z) 1200
CHAPTER 19 1205
Certain conditions originating in the perinatal period 1205
Fetus or newborn affected by maternal factors or by complications of pregnancy, labour or delivery (KA00-KA0Z) 1206
Disorders of newborn related to length of gestation or fetal growth (KA20-KA2Z) 1216
Birth injury (KA40-KA4Z) 1222
Infections of the fetus or newborn (KA60-KA6Z) 1228
Haemorrhagic or haematological disorders of fetus or newborn (KA80-KA8Z) 1232
Neurological disorders specific to the perinatal or neonatal period (KB00-KB0Z) 1239
Respiratory disorders specific to the perinatal or neonatal period (KB20-KB2Z) 1241
Cardiovascular disorders present in the perinatal or neonatal period (KB40-KB4Z) 1247
Transitory endocrine or metabolic disorders specific to fetus or newborn (KB60-KB6Z) 1248
Digestive system disorders of fetus or newborn (KB80-KB8Z) 1253
Genitourinary system disorders specific to the perinatal or neonatal period (KC00-KC0Z) 1256
Disorders involving the integument of fetus or newborn (KC20-KC9Z) 1256
Skin disorders associated with prematurity (KC30-KC3Y) 1258
Iatrogenic injuries involving the skin of the neonate (KC50-KC7Y) 1259
Postnatal iatrogenic skin injury (KC50-KC5Z) 1259
Disturbances of temperature regulation of newborn (KD10-KD1Z) 1259
Certain disorders originating in the perinatal period (KD30-KD3Y) 1260
CHAPTER 20 1266
Developmental anomalies 1266

Structural developmental anomalies primarily affecting one body system (LA00-LD0Z) 1266
Structural developmental anomalies of the nervous system (LA00-LA0Z) 1266
Structural developmental anomalies of the eye, eyelid or lacrimal apparatus (LA10-LA1Z) ... 1273
Structural developmental anomalies of the ear (LA20-LA2Z) 1278
Structural developmental anomalies of the face, mouth or teeth (LA30-LA5Z) 1280
Clefts of lip, alveolus or palate (LA40-LA4Z) 1282
Structural developmental anomalies of the neck (LA60-LA6Z) 1284
Structural developmental anomalies of the respiratory system (LA70-LA7Z)..... 1285
Structural developmental anomalies of the circulatory system (LA80-LA9Z) 1288
Structural developmental anomaly of heart or great vessels (LA80-LA8Z) 1288
Structural developmental anomalies of the diaphragm, abdominal wall or umbilical cord (LB00-LB0Z) 1311
Structural developmental anomalies of the digestive tract (LB10-LB1Z) 1312
Structural developmental anomalies of the liver, biliary tract, pancreas or spleen (LB20-LB2Z) 1318
Structural developmental anomalies of the urinary system (LB30-LB3Z) 1320
Structural developmental anomalies of the female genital system (LB40-LB4Z)..... 1324
Structural developmental anomalies of the male genital system (LB50-LB5Z)..... 1329
Structural developmental anomalies of the breast (LB60-LB6Z)..... 1332
Structural developmental anomalies of the skeleton (LB70-LB9Z) 1332
Congenital deformities of fingers or toes (LB80-LB8Z)..... 1338
Structural developmental anomalies of the skin (LC00-LC7Z)..... 1345
Developmental hamartomata of the epidermis and epidermal appendages (LC00-LC0Y) .. 1345
Developmental anomalies of skin pigmentation (LC10-LC1Y)..... 1346
Hamartomata derived from dermal connective tissue (LC20-LC2Y) 1346
Developmental defects of hair or nails (LC30-LC31)..... 1346
Developmental anomalies of cutaneous vasculature (LC50-LC5Z)..... 1346
Congenital anomalies of skin development (LC60-LC60) 1347
Structural developmental anomalies of the adrenal glands (LC80-LC8Z) 1347
Multiple developmental anomalies or syndromes (LD20-LD2Z) 1348
Chromosomal anomalies, excluding gene mutations (LD40-LD7Z)..... 1372
Sex chromosome anomalies (LD50-LD5Z) 1382
CHAPTER 21 1388
Symptoms, signs or clinical findings, not elsewhere classified..... 1388

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA00-MA3Y) 1389
Symptoms of blood, blood-forming organs, or the immune system (MA00-MA0Y) 1389
Clinical findings in blood, blood-forming organs, or the immune system (MA10-MA1Y) 1389
Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases (MA50-MA6Y) 1394
Results of function studies of the endocrine, nutritional or metabolic diseases (MA50-MA51) 1394
Symptoms, signs or clinical findings of speech or voice (MA80-MB0Y) 1395
Symptoms or signs involving speech or voice (MA80-MA8Y) 1395
Mental or behavioural symptoms, signs or clinical findings (MB20-MB2Y) 1397
Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y) 1415
Symptoms or signs involving the nervous system (MB40-MB6Y) 1415
Paralytic symptoms (MB50-MB5Z) 1421
Clinical findings in the nervous system (MB70-MB7Y) 1424
Symptoms, signs or clinical findings of the visual system (MC10-MC2Y) 1425
Symptoms or signs involving the visual system (MC10-MC1Y) 1425
Symptoms, signs or clinical findings of ear or mastoid process (MC40-MC6Y) 1426
Symptoms or signs involving the ear or mastoid process (MC40-MC4Y) 1426
Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y) 1427
Symptoms or signs involving the circulatory system (MC80-MC8Y) 1427
Symptoms, signs or clinical findings of the respiratory system (MD10-MD6Y) 1430
Symptoms or signs involving the respiratory system (MD10-MD3Y) 1430
Haemorrhage from respiratory passages (MD20-MD2Z) 1433
Clinical findings in the respiratory system (MD40-MD4Y) 1435
Symptoms, signs or clinical findings of the digestive system or abdomen (MD80-ME4Y) 1436
Symptoms or signs involving the digestive system or abdomen (MD80-ME1Y) 1436
Symptoms related to the upper gastrointestinal tract (MD90-MD9Y) 1438
Symptoms related to the lower gastrointestinal tract or abdomen (ME00-ME0Y) 1440
Clinical findings in the digestive system (ME20-ME2Y) 1443
Symptoms, signs or clinical findings involving the skin (ME60-ME6Y) 1447
Symptoms or signs involving the skin (ME60-ME6Y) 1447
Symptoms, signs or clinical findings of the musculoskeletal system (ME80-MF1Y) 1453
Symptoms or signs of the musculoskeletal system (ME80-ME8Y) 1453
Clinical findings in the musculoskeletal system (ME90-ME9Y) 1458

Symptoms, signs or clinical findings of the genitourinary system (MF30-MG0Y) 1460
Symptoms, signs or clinical findings involving the female genital system (MF30-MF3Y) 1460
Symptoms, signs or clinical findings involving the male genital system (MF40-MF4Y) 1461
Symptoms, signs or clinical findings involving the urinary system (MF50-MF5Y) 1462
Clinical findings in specimens from female genital organs (MF60-MF6Z) 1466
Clinical findings in specimens from male genital organs (MF70-MF7Z) 1466
Clinical findings in specimens from the urinary system (MF80-MF8Z) 1467
Clinical findings on examination of urine, without diagnosis (MF90-MF9Y) 1468
General symptoms, signs or clinical findings (MG20-MG9Y) 1471
General symptoms (MG20-MG4Y) 1471
Pain (MG30-MG3Z) 1475
Finding of microorganism resistant to antimicrobial drugs (MG50-MG5Z) 1493
Clinical findings in specimens from other specified organs, systems and tissues (MG60-MG6Y) 1508
Abnormal results, not elsewhere classified (MG70-MG7Z) 1508
Ill-defined and unknown causes of mortality (MH10-MH15) 1509
CHAPTER 22 1511
Injury, poisoning or certain other consequences of external causes 1511
Injuries to the head (NA00-NA0Z) 1512
Injuries to the neck (NA20-NA6Z) 1527
Injury of nerves or spinal cord at neck level (NA30-NA4Z) 1529
Injury of spinal cord at neck level (NA30-NA3Z) 1529
Injury of nerves at neck level (NA40-NA4Z) 1530
Injuries to the thorax (NA80-NB3Z) 1533
Injury of nerves or spinal cord at thorax level (NA90-NB2Z) 1535
Injury of spinal cord at thorax level (NA90-NA9Z) 1535
Injury of nerves at thorax level (NB00-NB0Y) 1536
Injuries to the abdomen, lower back, lumbar spine or pelvis (NB50-NB9Z) 1541
Injury of nerves or lumbar spinal cord at abdomen, lower back or pelvis level (NB60-NB7Z) 1544
Injury of spinal cord at abdomen, lower back or pelvis level (NB60-NB6Z) 1544
Injury of nerves at abdomen, lower back or pelvis level (NB70-NB7Z) 1544
Injuries to the shoulder or upper arm (NC10-NC1Z) 1554
Injuries to the elbow or forearm (NC30-NC3Z) 1560
Injuries to the wrist or hand (NC50-NC5Z) 1565

Injuries to the hip or thigh (NC70-NC7Z) 1574
Injuries to the knee or lower leg (NC90-NC9Z) 1580
Injuries to the ankle or foot (ND10-ND1Z) 1587
Injuries involving multiple body regions (ND30-ND37) 1594
Injuries to unspecified part of trunk, limb or body region (ND50-ND5Z) 1595
Effects of foreign body entering through natural orifice (ND70-ND7Z) 1597
Burns (ND90-NE2Z) 1600
Burns of external body surface, specified by site (ND90-ND9Z) 1600
Burns of eye or internal organs (NE00-NE0Z) 1603
Burns of multiple or unspecified body regions (NE10-NE11) 1604
Frostbite (NE40-NE4Z) 1604
Harmful effects of substances (NE60-NE6Z) 1605
Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z) 1606
Other or unspecified effects of external causes (NF00-NF0Z) 1611
CHAPTER 23 1616
External causes of morbidity or mortality 1616
Unintentional causes (PA00-PB6Z) 1616
Unintentional transport injury event (PA00-PA5Z) 1616
Unintentional land transport road traffic injury event (PA00-PA0Z) 1617
Unintentional land transport off-road nontraffic injury event (PA10-PA1Z) 1618
Unintentional land transport injury event unknown whether road traffic or off-road nontraffic (PA20-PA2Z) 1619
Unintentional railway transport injury event (PA30-PA3Z) 1620
Unintentional water transport injury event (PA40-PA4Z) 1620
Unintentional fall (PA60-PA6Z) 1621
Unintentional contact with person, animal or plant (PA70-PA7Z) 1621
Unintentional exposure to object, not elsewhere classified (PA80-PA8Z) 1622
Unintentional immersion, submersion or falling into water (PA90-PA9Z) 1622
Unintentional threat to breathing (PB00-PB0Z) 1623
Unintentional exposure to thermal mechanism (PB10-PB1Z) 1623
Unintentional exposure to or harmful effects of substances (PB20-PB36) 1624
Unintentional exposure to or harmful effects of drugs, medicaments or biological substances (PB20-PB29) 1624
Unintentional exposure to or harmful effects of substances chiefly nonmedicinal as to source (PB30-PB36) 1625

Unintentional exposure to other mechanism (PB50-PB5B) 1625
Intentional self-harm (PB80-PD3Z) 1626
Intentional self-harm by transport injury event (PB80-PC2Z) 1626
Intentional self-harm by water transport injury event (PB90-PB9Z) 1626
Intentional self-harm by air or space transport injury event (PC00-PC0Z) 1627
Intentional self-harm by fall or jump (PC30-PC3Z) 1627
Intentional self-harm by contact with person, animal or plant (PC40-PC4Z) 1627
Intentional self-harm by exposure to object, not elsewhere classified (PC50-PC5Z) 1628
Intentional self-harm by immersion, submersion or falling into water (PC60-PC6Z) 1628
Intentional self-harm by threat to breathing (PC70-PC7Z) 1629
Intentional self-harm by exposure to thermal mechanism (PC80-PC8Z) 1629
Intentional self-harm by exposure to or harmful effects of substances (PC90-PD05) 1630
Intentional self-harm by exposure to or harmful effects of drugs, medicaments or biological substances (PC90-PC99) 1630
Intentional self-harm by exposure to or harmful effects of substances chiefly nonmedicinal as to source (PD00-PD05) 1630
Intentional self-harm by exposure to other mechanism (PD20-PD29) 1631
Assault (PD50-PF2Z) 1631
Assault by transport events (PD50-PD9Z) 1631
Assault by water transport injury event (PD60-PD6Z) 1632
Assault by air or space transport injury event (PD70-PD7Z) 1632
Assault by causing a fall or jump (PE00-PE0Z) 1632
Assault by contact with person, animal or plant (PE10-PE1Z) 1633
Assault by exposure to object not elsewhere classified (PE20-PE4Z) 1633
Assault by being cut or pierced by sharp object (PE30-PE3Z) 1633
Assault by immersion, submersion or falling into water (PE50-PE5Z) 1634
Assault by threat to breathing (PE60-PE6Z) 1634
Assault by exposure to thermal mechanism (PE70-PE7Z) 1634
Assault by exposure to or harmful effects of substances (PE80-PE95) 1635
Assault by exposure to or harmful effects of drugs, medicaments or biological substances (PE80-PE8Z) 1635
Assault by exposure to or harmful effects of substances chiefly nonmedicinal as to source (PE90-PE95) 1636
Assault by exposure to other mechanism (PF10-PF1B) 1636
Undetermined intent (PF40-PH8Z) 1637

Transport injury event of undetermined intent (PF40-PG4Z) 1637
Land transport road traffic injury event of undetermined intent (PF40-PF4Z) 1637
Land transport off-road nontraffic injury event of undetermined intent (PF50-PF5Z) 1638
Land transport injury event of undetermined intent, unknown whether road traffic or off-road nontraffic (PF60-PF6Z) 1639
Railway transport injury event of undetermined intent (PF70-PF7Z) 1640
Water transport injury event of undetermined intent (PF80-PG1Z) 1640
Water transport injury event of undetermined intent with water vessel damaged, disabled or destroyed (PF80-PF8Z) 1640
Water transport injury event of undetermined intent with water vessel not damaged, disabled or destroyed (PF90-PF9Z) 1641
Air or space transport injury event of undetermined intent (PG20-PG2Z) 1641
Fall or jump with undetermined intent (PG50-PG5Z) 1641
Contact with person, animal or plant with undetermined intent (PG60-PG6Z) 1641
Contact with object, not elsewhere classified with undetermined intent (PG70-PH0Z) 1642
Struck by projectile from firearm of undetermined intent (PG70-PG7Z) 1642
Cut or pierced by sharp object of undetermined intent (PG90-PG9Z) 1642
Immersion, submersion or falling into water with undetermined intent (PH10-PH1Z) 1643
Threat to breathing with undetermined intent (PH20-PH2Z) 1643
Exposure to thermal mechanism with undetermined intent (PH30-PH3Z) 1644
Exposure to or harmful effects of substances, undetermined intent (PH40-PH56) 1644
Exposure to or harmful effects of undetermined intent of drugs, medicaments or biological substances (PH40-PH49) 1644
Exposure to or harmful effects of undetermined intent of substances chiefly nonmedicinal as to source (PH50-PH56) 1645
Exposure to other mechanism with undetermined intent (PH70-PH7B) 1645
Exposure to extreme forces of nature (PJ00-PJ0Z) 1646
Maltreatment (PJ20-PJ2Z) 1647
Legal intervention (PJ40-PJ4Z) 1647
Armed conflict (PJ60-PK6Z) 1648
Explosion of marine weapons during armed conflict (PJ60-PJ6Z) 1648
Attack on or destruction of aircraft during armed conflict (PJ70-PJ7Z) 1648
Other explosions or fragments during armed conflict (PJ80-PJ8Z) 1648
Fires, conflagrations or hot substances during armed conflict (PJ90-PJ9Z) 1649

Firearm discharge or other forms of conventional warfare during armed conflict (PK00-PK0Z) 1649
Use of nuclear weapons during armed conflict (PK10-PK1Z) 1649
Use of biological weapons during armed conflict (PK20-PK2Z) 1649
Chemical weapons or other forms of unconventional warfare during armed conflict (PK30-PK3Z) 1649
Injury event occurring after cessation of armed conflict (PK40-PK4Z) 1650
Causes of healthcare related harm or injury (PK80-PL14.Z) 1650
Surgical or other medical procedures associated with injury or harm in diagnostic or therapeutic use (PK80-PK8Z) 1650
Surgical or other medical devices, implants or grafts associated with injury or harm in therapeutic use (PK90-PK9C.4) 1666
Substances associated with injury or harm in therapeutic use (PL00-PL0Z) 1686
CHAPTER 24 1696
Factors influencing health status or contact with health services 1696
Reasons for contact with the health services (QA00-QD3Z) 1696
Contact with health services for purposes of examination or investigation (QA00-QA0Z) 1696
Contact with health services for counselling (QA10-QA1Z) 1703
Contact with health services for reasons associated with reproduction (QA20-QA4Z) 1705
Contact with health services for procreative management (QA30-QA3Z) 1705
Health care related circumstances influencing the episode of care without injury or harm (QA50-QB0Z) 1714
Circumstances associated with a surgical or other medical procedure influencing the episode of care, without injury or harm (QA50-QA5Z) 1714
Circumstances associated with a surgical or other medical device influencing the episode of care without injury or harm (QA60-QA6Z) 1715
Circumstances associated with exposure to a drug, medicament or biological substance influencing the episode of care without injury or harm (QA70-QA7Z) 1716
Circumstances associated with other aspects of care influencing the episode of care without injury or harm (QA80-QA8Z) 1718
Factors related to medical facilities and other health care (QB10-QB1Z) 1720
Donors of organs or tissues (QB20-QB2Z) 1721
Fitting, adjustment or management of devices (QB30-QB3Z) 1721
Dependence on enabling machines or devices (QB40-QB4Z) 1723
Presence of device, implants or grafts (QB50-QB5Z) 1724
Surgical or postsurgical states (QB60-QB6Z) 1725

Convalescence (QB70-QB7Z) 1727
Contact with health services for specific surgical interventions (QB80-QB8Z) 1727
Contact with health services for nonsurgical interventions not involving devices (QB90-QB9Z) 1728
Contact with health services related to immunizations or certain other prophylactic measures (QC00-QC0Z) 1731
Interventions not carried out (QC10-QC1Z) 1733
Contact with health services associated with the health of others (QC20-QC2Z) 1733
Personal or family history or late effect of prior health problems (QC40-QC8Z) 1734
Personal history of health problems (QC40-QC4Z) 1734
Family history of health problems (QC60-QC6Z) 1736
Risk factors associated with infectious or certain other conditions (QC90-QD2Z) 1737
Carrier of infectious disease agent (QD00-QD0Z) 1738
Concern about body appearance (QD30-QD3Z) 1739
Factors influencing health status (QD50-QF2Z) 1739
Problems associated with finances (QD50-QD5Z) 1739
Problems associated with drinking water or nutrition (QD60-QD6Z) 1739
Problems associated with the environment (QD70-QD7Z) 1739
Problems associated with employment or unemployment (QD80-QD8Z) 1740
Problems associated with education (QD90-QD9Z) 1742
Problems associated with social or cultural environment (QE00-QE0Z) 1742
Problems associated with health behaviours (QE10-QE2Z) 1743
Hazardous substance use (QE10-QE1Z) 1743
Problems associated with social insurance or welfare (QE30-QE3Z) 1748
Problems associated with the justice system (QE40-QE4Z) 1749
Problems associated with relationships (QE50-QE5Z) 1749
Problems associated with absence, loss or death of others (QE60-QE6Z) 1751
Problems associated with harmful or traumatic events (QE80-QE8Z) 1751
Problems associated with upbringing (QE90-QE9Z) 1753
Acquired absence of body structure (QF00-QF0Z) 1754
Difficulty or need for assistance with activities (QF20-QF2Z) 1755
CHAPTER 25 1757
Codes for special purposes 1757
International provisional assignment of new diseases of uncertain aetiology and emergency use (RA00-RA09) 1757

National provisional assignment of new diseases of uncertain aetiology (RA20-RA26) 1758
CHAPTER 26 1760
Supplementary Chapter Traditional Medicine Conditions - Module I 1760
CHAPTER V 1783
Supplementary section for functioning assessment 1783
WHODAS 2.0 36-item version 1783
Cognition [WHODAS] 1784
Mobility [WHODAS] 1784
Self-care [WHODAS] 1785
Getting along [WHODAS] 1785
Life activities [WHODAS] 1786
Participation and impact of health problems [WHODAS] 1787
Brief Model Disability Survey 1787
Mental functions [BMDS] 1788
Sensory functions and pain [BMDS] 1788
Generic functioning domains 1788
Mental functions 1788
Sensory functions and pain 1790
Voice and speech functions 1791
Functions of the cardiovascular, haematological, immunological and respiratory systems 1791
Functions of the digestive, metabolic and endocrine systems 1791
Genitourinary and reproductive functions 1792
Neuromusculoskeletal and movement-related functions 1792
Functions of the skin and related structures 1793
Learning and applying knowledge 1793
General tasks and demands 1793
Communication 1794
Mobility 1794
Self-care 1795
Domestic life 1797
Interpersonal interactions and relationships 1798
Major life areas 1798
Community, social and civic life 1799
CHAPTER X 1800

Extension Codes 1800
Severity Scale Value 1801
Generic Severity Scale Value 1801
Mild Moderate Severe Scale Value 1801
Clinical Staging Scale Value 1801
Grading Scale Value 1802
Phase Scale Value 1802
Problem Scale Value 1802
Disease Specific Severity Scale Value 1803
Tumour spread simplified Scale Value 1803
Tumour spread staging Scale Value 1803
Histological Grading Scale Value 1803
NYHA Functional Classification: Class I-IV 1804
Chronic Obstructive Lung Disease Criteria: GOLD 1-4 1804
Peripheral arterial disease (PAD) Severity Classification by Fontaine 1804
Endometriosis Severity Scale Value 1804
Vocal Cord Paralysis Severity Scale Value 1805
Sepsis Severity Scale Value 1805
Peripheral arterial disease (PAD) Severity Classification by Rutherford 1805
Pain Severity Scale Value 1806
Pain intensity 1806
Pain-related distress 1806
Pain-related interference 1807
Presence of psychosocial factors Scale Value 1807
Adult Nutritional Status Scale Value 1807
Coronary atherosclerosis Severity Scale Value 1808
Anaphylaxis Severity Scale Value 1808
Temporality 1808
Course of the Condition 1808
Pattern, Activity, or Clinical Status 1808
Intermittent-Persistent Scale Value 1808
Course 1809
Acute-Subacute-Chronic Scale Value 1809
Onset 1809

Time in Life 1809
Duration of pregnancy 1811
Aetiology 1811
Causality 1811
Occupational relevance 1811
Infectious Agents 1812
Bacteria 1812
Virus 1825
Fungi 1835
Parasites 1839
Helminths 1839
Protozoa 1842
Lice and Mites 1843
Other Pathogens 1844
Topology Scale Value 1844
Relational 1844
Distribution 1845
Laterality 1845
Regional 1845
Anatomy and topography 1846
Functional anatomy 1846
Haematopoietic system 1846
Immune system 1847
Lymphoid organs 1847
Endocrine system 1852
Nervous system 1852
Nerve 1868
Number of Nerves 1873
Visual system 1873
Auditory system 1875
Circulatory system 1877
Lymphatic system 1901
Respiratory system 1904
Digestive system 1907

Integumentary system 1915
Musculoskeletal system 1917
Bones 1917
Joints and ligaments 1929
Number of joints 1938
Number of Ligaments 1938
Cartilage 1939
Muscles 1939
Tendons 1947
Genitourinary system 1954
Urinary system 1954
Reproductive system 1956
Surface topography 1959
Partonomic view 1974
Walls in the Body 1974
Body Tissues 1975
Body Cavities 1976
Histopathology 1977
Acinar cell neoplasms 1977
Acinar cell neoplasms, benign 1977
Acinar cell neoplasms, malignant 1978
Acinar cell neoplasms, uncertain whether benign or malignant 1978
Adenomas and adenocarcinomas 1978
Adenomas, benign 1978
Adenocarcinomas in situ 1982
Adenocarcinomas, malignant 1983
Adenomas and adenocarcinomas, uncertain whether benign or malignant 1991
Adnexal and skin appendage neoplasms 1992
Adnexal and skin appendage neoplasms, benign 1992
Adnexal and skin appendage neoplasms, in situ 1993
Adnexal and skin appendage neoplasms, malignant 1993
Adnexal and skin appendage neoplasms, uncertain whether benign or malignant 1994
Basal cell neoplasms 1994
Basal cell neoplasms, benign 1994

Basal cell neoplasms, malignant 1994
Basal cell neoplasms, uncertain whether benign or malignant 1995
Blood vessel tumours 1996
Blood vessel tumours, benign 1996
Blood vessel tumours, malignant 1997
Blood vessel tumours, uncertain whether benign or malignant 1997
Complex epithelial neoplasms 1998
Complex epithelial neoplasms, benign 1998
Complex epithelial neoplasms, malignant 1998
Complex mixed and stromal neoplasms 1998
Complex mixed and stromal neoplasms, benign 1998
Complex mixed and stromal neoplasms, malignant 1999
Complex mixed and stromal neoplasms, uncertain whether benign or malignant 2001
Cystic, mucinous and serous neoplasms 2001
Cystic, mucinous and serous neoplasms, benign 2001
Cystic, mucinous and serous neoplasms, in situ 2002
Cystic, mucinous and serous neoplasms, malignant 2003
Cystic, mucinous and serous neoplasms, uncertain whether benign or malignant 2004
Ductal and lobular neoplasms 2004
Ductal and lobular neoplasms, benign 2004
Ductal and lobular neoplasms, in situ 2005
Ductal and lobular neoplasms, malignant 2006
Epithelial neoplasms, NOS 2008
Epithelial neoplasms, benign 2008
Epithelial neoplasms, in situ 2008
Epithelial neoplasms, malignant 2008
Epithelial neoplasms, uncertain whether benign or malignant 2010
Fibroepithelial neoplasms 2010
Fibroepithelial neoplasms, benign 2010
Fibroepithelial neoplasms, malignant 2011
Fibroepithelial neoplasms, uncertain whether benign or malignant 2011
Fibromatous neoplasms 2011
Fibromatous neoplasms, benign 2011
Fibromatous neoplasms, malignant 2013

Fibromatous neoplasms, uncertain whether benign or malignant 2014
Germ cell neoplasms 2015
Germ cell neoplasms, benign 2015
Germ cell neoplasms, in situ 2015
Germ cell neoplasms, malignant 2015
Germ cell neoplasms, uncertain whether benign or malignant 2016
Giant cell tumours 2017
Giant cell tumours, benign 2017
Giant cell tumours, malignant 2017
Giant cell tumours, uncertain whether benign or malignant 2017
Gliomas 2017
Gliomas, benign 2017
Gliomas, malignant 2017
Gliomas, uncertain whether benign or malignant 2021
Granular cell tumours and alveolar soft part sarcomas 2021
Granular cell tumours and alveolar soft part sarcomas, benign 2021
Granular cell tumours and alveolar soft part sarcomas, malignant 2022
Lipomatous neoplasms 2022
Lipomatous neoplasms, benign 2022
Lipomatous neoplasms, malignant 2022
Lipomatous neoplasms, uncertain whether benign or malignant 2023
Lymphatic vessel tumours 2023
Lymphatic vessel tumours, benign 2023
Lymphatic vessel tumours, malignant 2024
Lymphatic vessel tumours, uncertain whether benign or malignant 2024
Meningiomas 2024
Meningiomas, benign 2024
Meningiomas, malignant 2025
Meningiomas, uncertain whether benign or malignant 2025
Mesonephromas 2025
Mesonephromas, benign 2025
Mesonephromas, malignant 2025
Mesonephromas, uncertain whether benign or malignant 2025
Mesothelial neoplasms 2026

Mesothelial neoplasms, benign 2026
Mesothelial neoplasms, malignant 2026
Mesothelial neoplasms, uncertain whether benign or malignant 2026
Miscellaneous bone tumours 2026
Miscellaneous bone tumours, benign 2026
Miscellaneous bone tumours, malignant 2027
Miscellaneous tumours 2027
Miscellaneous tumours, benign 2027
Miscellaneous tumours, malignant 2027
Miscellaneous tumours, uncertain whether benign or malignant 2028
Mucoepidermoid neoplasms 2028
Mucoepidermoid neoplasms, malignant 2028
Mucoepidermoid neoplasms, uncertain whether benign or malignant 2028
Myomatous neoplasms 2028
Myomatous neoplasms, benign 2028
Myomatous neoplasms, malignant 2029
Myomatous neoplasms, uncertain whether benign or malignant 2030
Myxomatous neoplasms 2030
Myxomatous neoplasms, benign 2030
Myxomatous neoplasms, malignant 2030
Nerve sheath tumours 2031
Nerve sheath tumours, benign 2031
Nerve sheath tumours, malignant 2032
Nerve sheath tumours, uncertain whether benign or malignant 2032
Neuroepitheliomatous neoplasms 2032
Neuroepitheliomatous neoplasms, benign 2032
Neuroepitheliomatous neoplasms, malignant 2033
Neuroepitheliomatous neoplasms, uncertain whether benign or malignant 2034
Nevi and melanomas 2034
Nevi and melanomas, benign 2034
Nevi and melanomas, in situ 2036
Nevi and melanomas, malignant 2036
Nevi and melanomas, uncertain whether benign or malignant 2037
Odontogenic tumours 2037

Odontogenic tumours, benign 2037
Odontogenic tumours, malignant 2038
Odontogenic tumours, uncertain whether benign or malignant 2039
Osseous and chondromatous neoplasms 2039
Osseous and chondromatous neoplasms, benign 2039
Osseous and chondromatous neoplasms, malignant 2040
Osseous and chondromatous neoplasms, uncertain whether benign or malignant 2041
Paragangliomas and glomus tumours 2041
Paragangliomas and glomus tumours, benign 2041
Paragangliomas and glomus tumours, malignant 2041
Paragangliomas and glomus tumours, uncertain whether benign or malignant 2042
Soft tissue tumours and sarcomas, NOS 2042
Soft tissue tumours and sarcomas, NOS, benign 2042
Soft tissue tumours and sarcomas, NOS, malignant 2043
Soft tissue tumours and sarcomas, NOS, uncertain whether benign or malignant 2043
Specialized gonadal neoplasms 2043
Specialized gonadal neoplasms, benign 2043
Specialized gonadal neoplasms, malignant 2044
Specialized gonadal neoplasms, uncertain whether benign or malignant 2044
Squamous cell neoplasms 2046
Squamous cell neoplasms, benign 2046
Squamous cell neoplasms, in situ 2046
Squamous cell neoplasms, malignant 2047
Synovial-like neoplasms 2049
Synovial-like neoplasms, benign 2049
Synovial-like neoplasms, malignant 2049
Thymic epithelial neoplasms 2049
Thymic epithelial neoplasms, benign 2049
Thymic epithelial neoplasms, malignant 2049
Thymic epithelial neoplasms, uncertain whether benign or malignant 2050
Transitional cell papillomas and carcinomas 2050
Transitional cell papillomas and carcinomas, benign 2050
Transitional cell papillomas and carcinomas, in situ 2051
Transitional cell papillomas and carcinomas, malignant 2051

Transitional cell papillomas and carcinomas, uncertain whether benign or malignant 2051
Trophoblastic neoplasms 2052
Trophoblastic neoplasms, benign 2052
Trophoblastic neoplasms, malignant 2052
Trophoblastic neoplasms, uncertain whether benign or malignant 2052
Myelodysplastic syndromes 2052
Myelodysplastic syndromes, malignant 2052
Other haematologic disorders 2053
Other haematologic disorders, malignant 2053
Other haematologic disorders, uncertain whether benign or malignant 2053
Chronic myeloproliferative disorders 2053
Chronic myeloproliferative disorders, malignant 2053
Leukaemias 2054
leukaemias, NOS, malignant 2054
Lymphoid leukaemias, malignant 2055
Myeloid leukaemias, malignant 2056
Myeloid leukaemias, uncertain whether benign or malignant 2058
Other leukaemias, malignant 2058
Hodgkin and non-Hodgkin lymphomas 2058
Malignant lymphomas, NOS or diffuse 2058
Hodgkin lymphoma 2059
Non-Hodgkin lymphomas 2061
Immunoproliferative diseases 2065
Immunoproliferative diseases, malignant 2065
Immunoproliferative diseases, uncertain whether benign or malignant 2065
Plasma cell tumours 2066
Mast cell tumours 2066
Mast cell tumours, malignant 2066
Mast cell tumours, uncertain whether benign or malignant 2067
Neoplasms of histiocytes and accessory lymphoid cells 2067
Neoplasms of histiocytes and accessory lymphoid cells, malignant 2067
Neoplasms of histiocytes and accessory lymphoid cells, uncertain whether benign or malignant 2068
Dimensions of injury 2068

Dimensions of Burns 2068
Burns classified according to extent of body surface involved 2068
Extent of body surface with full thickness or deep full thickness burn 2069
Outcome of deep full thickness or complex burn 2069
Joint involvement in fracture 2070
Open fracture or closed fracture 2070
Fracture types 2070
Types of superficial injuries 2071
Dimensions of external causes 2071
Additional aspects of mechanism 2071
Exposure to other mechanism 2073
Activity when injured 2074
Sports, recreation or leisure activity 2075
Being taken care of 2075
Aspects of place of injury occurrence 2075
Type of place 2075
Part of place 2079
Objects, living things or substances involved in causing injury 2080
Land vehicle or means of land transport 2080
Mobile machinery or special purpose vehicle 2081
Watercraft or means of water transport 2082
Aircraft or means of air transport 2083
Utensil or container 2087
Item mainly for personal use 2088
Equipment mainly used in sports or recreational activity 2090
Weapon 2093
Person, animal or plant 2094
Building, building component, or related fitting 2096
Ground surface or surface conformation 2098
Material, not elsewhere classified 2099
Food, drink 2100
Alcohol use in injury event 2101
Psychoactive drug use in injury event 2102
Aspects of transport injury events 2102

Mode of transport of person injured in transport event 2102
Vehicle user role of person injured in transport event 2108
Counterpart in land transport crash 2109
Other mechanisms of transport injury without counterpart 2114
Aspects of sports injury events 2114
Type of sport or exercise activity 2114
Phase of sport or exercise activity 2122
Personal countermeasures in sport or exercise 2123
Environmental countermeasures in sport or exercise 2123
Aspects of occupational injury events 2124
Economic activity 2124
Occupation 2125
Aspects of assault and maltreatment 2125
Perpetrator -victim relationship 2125
Gender of perpetrator 2127
Context of assault and maltreatment 2127
Aspects of intentional self-harm events 2129
Proximal risk-factors for intentional self-harm 2129
Previous non-fatal intentional self harm 2130
Intention to die aspect of self-harm 2131
Aspects of armed conflict 2131
Type of armed conflict 2131
Role of injured person in armed conflict 2131
Type of legal intervention 2131
Aspects of incidents related to devices 2132
Investigation conclusion of events related to devices 2167
Findings of investigations related to devices 2167
Cause investigation and type of investigation 2178
Medical device component 2181
Biological and chemical medical device component 2181
Electrical and magnetic medical device component 2182
Measurement medical device component 2187
Mechanical medical device component 2189
Optical medical device component 2200

Safety medical device component 2201
Other component of medical device 2202
Consciousness 2202
Glasgow Coma Scale Eye opening score 2202
Glasgow Coma Scale Motor score 2203
Glasgow Coma Scale Verbal score 2203
Pupil reaction score 2203
Substances 2204
Medicaments 2204
Agents primarily affecting the gastrointestinal system 2204
Gastric acid secretion suppressants 2204
Histamine H2-receptor antagonists 2204
Other drugs for peptic ulcer and gastro-oesophageal reflux disease 2205
Drugs for functional gastrointestinal disorders 2206
Antidiarrhoeal drugs 2207
Digestants 2208
Antinauseants, antiemetics and emetics 2209
Other agents primarily affecting gastrointestinal system 2209
Other antacids and anti-gastric-secretion drugs 2210
Other laxatives 2211
Saline and osmotic laxatives 2212
Drugs for constipation 2213
Laxatives 2213
Propulsives 2215
Antipropulsives 2216
Agents primarily affecting blood constituents and immune system 2216
Antineoplastic agents 2216
Antineoplastic antimetabolites 2217
Antineoplastic natural products and derivatives 2218
Monoclonal antibodies 2219
Other antineoplastic drugs 2221
Immunostimulants 2228
Immunosuppressive agents 2230
Anticoagulants and antithrombotics 2232

Platelet aggregation inhibitors....2233
Anticoagulants....2235
Other fibrinolysis-affecting drugs....2236
Anticoagulant antagonists, vitamin K and other coagulants....2236
Natural blood and blood products....2237
Iron and its compounds....2239
Vitamin B12, folic acid and other anti-megaloblastic-anaemia preparations....2241
Enzymes....2241
Drugs used in hereditary angioedema....2242
Local hemostatics....2242
Other haematological agents....2243
Agents affecting genitourinary system, sex and anabolic hormones....2243
Other gynaecologicals....2243
Intrauterine and intravaginal contraceptives....2243
Estrogens and progestogens....2243
Estrogen receptor modulators....2246
Progesterone receptor modulators....2247
Androgens and anabolic congeners....2247
Other urologicals....2248
Drugs used in benign prostatic hypertrophy....2249
Hormones and their synthetic substitutes and antagonists, not elsewhere classified....2249
Anterior pituitary [adenohypophyseal] hormones and analogues....2249
Posterior pituitary hormones and analogues....2250
Hypothalamic hormones and analogues....2251
Gonadotropin releasing hormones and analogues....2251
Prolactin inhibitors....2252
Glucocorticoids and synthetic analogues....2252
Anticorticosteroids....2253
Antigonadotrophins, antiestrogens, antiandrogens, not elsewhere classified....2253
Thyroid hormones and substitutes....2255
Antithyroid drugs....2255
Iodine therapy....2256
Parathyroid hormones and analogues....2256
Antiparathyroid agents....2256

Insulin and antidiabetic drugs 2256
Sulfonamides (heterocyclic) 2258
Agents affecting bones, joints and other connective tissue, not elsewhere classified 2261
Bisphosphonates 2261
Bone morphogenetic proteins 2261
Enzymes affecting bones, joints and other connective tissue, not elsewhere classified 2261
Agents primarily affecting water and nutrition-balance and metabolism 2262
Drugs affecting uric acid metabolism and other antigout preparations 2262
Mineral salts and supplements, not elsewhere classified 2263
Electrolytic, caloric and water-balance agents 2266
Diuretics 2267
Loop [high-ceiling] diuretics 2270
Mineralocorticoids 2271
Vitamins and antioxidants 2271
Enzymes and digestants 2273
Agents in bile and liver therapy 2274
Antiobesity preparations 2275
Drugs used to treat enzyme deficiencies and disorders of aminoacid, glycolipid and glycoprotein metabolism 2276
Agents primarily affecting the cardiovascular system 2277
Agents acting on the renin-angiotensin system 2277
Antihyperlipidemic and antiarteriosclerotic drugs 2278
Calcium-channel blockers 2280
Cardiac stimulants 2282
Predominantly beta-adrenoreceptor agonists 2283
Antiarrhythmics 2286
Other antihypertensive drugs 2287
Vasodilators used in cardiac diseases 2290
Peripheral vasodilators 2292
Other agents primarily affecting the cardiovascular system 2294
Vasoprotectives 2295
Agents used in antivaricose therapy 2296
Drugs primarily affecting the autonomic nervous system 2296
Adrenergic agonists 2296

Adrenergic antagonists 2298
Alpha-adrenoreceptor antagonists 2298
Beta-adrenoreceptor antagonists 2298
Parasympatholytics [anticholinergics and antimuscarinics] and spasmolytics 2300
Parasympathomimetics [cholinergics] 2306
Anticholinesterase agents 2306
Ganglionic blocking drugs 2307
Drugs used in addictive disorders 2308
Antivertigo and motion sickness preparations 2308
Agents primarily acting on smooth and skeletal muscles and the respiratory system 2308
Oxytocic drugs 2308
Muscle relaxants 2309
Other drugs acting on muscles 2311
Expectorants and mucolytics 2313
Antitussives 2315
Respiratory stimulants 2319
Systemic antibiotics, anti-infectives and antiparasitics 2320
Systemic antibiotics and antibacterials 2320
Penicillins 2320
Cephalosporins and other beta-lactam antibiotics 2322
Macrolides 2326
Aminoglycosides 2327
Other antibacterials 2330
Tetracyclines 2331
Antimycobacterials 2331
Antifungal agents 2334
Antiviral drugs 2334
Antivenin, antivenom (sera), Immunoglobulin 2339
Vaccines 2341
Other specified systemic anti-infectives and antiparasitics 2354
Antiprotozoal drugs 2354
Antimalarials and drugs acting on other blood protozoa 2355
Other agents against amoebiasis and other protozoal diseases 2357
Anthelminthics 2359

Neuroprotective agents, not elsewhere classified 2361
Analgesics, antipyretics and anti-inflammatory drugs 2362
Specific antirheumatic agents 2365
Acetylsalicylic acid and other salicylates 2365
Pyrazolone derivatives 2366
Paracetamol (acetaminophen) and 4-aminophenol derivatives 2367
Other nonopioid analgesics and antipyretics, not elsewhere classified 2367
Antiepileptics and antiparkinsonism drugs 2369
Antipsychotics [neuroleptics] 2372
Phenothiazine antipsychotics and neuroleptics 2372
Butyrophenone derivatives 2374
Lithium 2375
Other antipsychotics and neuroleptics 2375
Antidepressants 2377
Monoamine oxidase-inhibitor, non-selective 2377
Selective serotonin reuptake inhibitors 2377
Serotonin-norepinephrine reuptake inhibitors 2378
Other antidepressants 2378
Cannabinoids & hallucinogens 2380
Other psychodysleptics [hallucinogens] 2382
Synthetic cannabinoids 2383
Unspecified psychodysleptics [hallucinogens] 2383
Opioids 2383
Opioids or related analgesics and agents affecting opioid receptors 2383
Opioid receptor antagonists 2385
Psychostimulants 2388
Cathinone 2388
Other specified amphetamines 2388
Unspecified psychostimulant drug 2388
Sedative hypnotic drugs and other central nervous system depressants 2388
Anaesthetics and therapeutic gases 2388
General anaesthetics 2388
Sedative-hypnotic and anxiolytic drugs 2394
Benzodiazepines 2394

Bromine compounds 2398
Other sedatives, hypnotics and antianxiety drugs 2398
Other and unspecified drugs, medicaments and biological substances 2402
Antidotes 2402
Iron chelating agents 2404
Drugs for treatment of hyperkalaemia, hypercalcaemia and hyperphosphataemia 2404
Detoxifying agents for antineoplastic treatment 2404
Protectives against UV-radiation for systemic use 2405
Antipsoriatics for systemic use 2405
Vitamin A derivative and other anti-acne preparations for systemic use 2405
Agents used in diagnostic tests, not elsewhere classified 2405
Tests for bile duct patency 2406
Tests for pituitary function 2406
Medical gases 2408
Contrast media 2408
X-ray contrast media, non-iodinated 2409
Topical agents primarily affecting skin and mucous membrane and ophthalmological, otorhinolaryngological and dental drugs 2413
Antipruritics 2413
Camphor 2413
Emollients, demulcents and protectants 2413
Fluoride preparations 2416
Iodine (antiseptic) 2416
Keratolytics, keratoplastics, and other hair treatment drugs and preparations 2416
Ophthalmological drugs and preparations 2418
Other dental drugs, topically applied 2422
Other local antifungal, anti-infective and anti-inflammatory drugs 2422
Other local astringents and local detergents 2433
Other topical agents 2433
Otorhinolaryngological drugs and preparations 2436
Topical corticosteroid preparations 2437
Retinoids topical 2438
Substances, chiefly nonmedicinal 2439
Animal toxin, venom, or poison 2449

Corrosive substance 2457
Explosive chemical 2460
Gas, fumes or vapour 2461
Halogen derivative of aliphatic and aromatic hydrocarbons 2464
Inorganic substance 2467
Metal 2468
Organic solvent 2472
Paint or dye 2478
Substance of plant origin 2480
Substance of human origin 2487
Adhesive, not elsewhere classified 2487
Chemical compounds not elsewhere classified 2487
Chemicals used as process regulators 2488
Cleaning agent, not elsewhere classified 2488
Food additives not elsewhere classified 2488
Organic compounds not elsewhere classified 2488
Preservative nonmedicinal, not elsewhere classified 2489
Substance eaten as food, nonbacterial, not elsewhere classified 2490
Synthetic fragrances not elsewhere classified 2490
Diagnosis code descriptors 2490
Discharge diagnosis types 2490
Diagnosis timing 2491
Diagnosis timing in relation to surgical procedure 2491
Diagnosis method of confirmation 2491
Diagnosis certainty 2491
Obstetrical diagnosis timing 2491
Encounter descriptors 2492

CHAPTER 01

Certain infectious or parasitic diseases

This chapter has 342 four-character categories.

Code range starts with 1A00

This chapter includes certain conditions caused by pathogenic organisms or microorganisms, such as bacteria, viruses, parasites or fungi.

Exclusions: Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

Coded Elsewhere: Infections of the fetus or newborn (KA60-KA6Z)

Human prion diseases (8E00-8E0Z)

Pneumonia (CA40)

This chapter contains the following top level blocks:

- Gastroenteritis or colitis of infectious origin
- Predominantly sexually transmitted infections
- Mycobacterial diseases
- Certain staphylococcal or streptococcal diseases
- Pyogenic bacterial infections of the skin or subcutaneous tissues
- Certain zoonotic bacterial diseases
- Other bacterial diseases
- Human immunodeficiency virus disease
- Viral infections of the central nervous system
- Non-viral and unspecified infections of the central nervous system
- Dengue
- Certain arthropod-borne viral fevers
- Certain zoonotic viral diseases
- Certain other viral diseases
- Influenza
- Viral hepatitis
- Viral infections characterised by skin or mucous membrane lesions
- Mycoses
- Parasitic diseases
- Sepsis
- Sequelae of infectious diseases

Gastroenteritis or colitis of infectious origin (1A00-1A40.Z)

Coded Elsewhere: Intestinal fungal infections

Bacterial intestinal infections (1A00-1A0Z)

Any condition of the intestines, caused by an infection with a bacterial source.

Exclusions: Bacterial foodborne intoxications (1A10-1A1Z)

Coded Elsewhere: Abdominal actinomycosis (1C10.1)

Listerial gastroenteritis (1C1A.Y)

1A00 **Cholera**

Cholera is a potentially epidemic and life-threatening infection of the intestine, characterised by extreme watery (secretory) diarrhoea often accompanied by vomiting, with rapid depletion of body fluids and salt that may result in hypovolemic shock and acidosis. Cholera outbreaks are caused by toxigenic strains of Vibrio cholerae serogroups O1 and O139. Serogroup O1 has two biovars; classical and eltor. Vibrio cholerae O1, biovar cholerae is classical type. Vibrio cholerae O1, biovar eltor is eltor type.

Inclusions: cholera syndrome

1A01 **Intestinal infection due to other Vibrio**

1A02 **Intestinal infections due to Shigella**

A disease caused by an infection with the gram-negative bacteria genus Shigella. This disease is characterised by an acute onset of small volume diarrhoea, accompanied by fever and nausea. This disease may also present with toxaemia, vomiting, cramps, and tenesmus. Transmission is by ingestion of contaminated food, or direct contact. Confirmation is by identification of Shigella in a faecal sample.

Coded Elsewhere: Sepsis due to shigella with septic shock (1C41)

1A03 **Intestinal infections due to Escherichia coli**

Any condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria Escherichia coli.

1A03.0 Enteropathogenic Escherichia coli infection

An infection of the gastrointestinal system, caused by the gram-negative bacteria Escherichia coli. It is characterised by acute, profuse, watery diarrhoea. Transmission is by the faecal-oral route from contaminated food, water, or fomites. Confirmation is by identification of the Escherichia coli in a faecal sample.

1A03.1 Enterotoxigenic Escherichia coli infection

A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria Escherichia coli. This condition is characterised by acute, watery diarrhoea due to toxins released from the bacteria. Transmission is by the faecal-oral route from ingestion of contaminated food, water, or fomites. Confirmation is by identification of the Escherichia coli in faecal sample.

1A03.2 **Enteroinvasive Escherichia coli infection**

A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria Escherichia coli. This condition is characterised by acute and profuse diarrhoea (that may be haemorrhagic), fever, and abdominal cramps. Transmission is by the faecal-oral route from ingestion of contaminated food or water. Confirmation is by identification of the Escherichia coli in a faecal sample.

1A03.3 **Enterohaemorrhagic Escherichia coli infection**

1A03.Y **Intestinal infections due to other specified Escherichia coli**

1A03.Z **Intestinal infections due to Escherichia coli, unspecified**

1A04 **Intestinal infections due to Clostridioides difficile**

A disease of the colon, caused by an infection with the gram-positive bacteria Clostridioides difficile (formerly known as Clostridium difficile). This disease is characterised by colitis, diarrhoea, abdominal pain, and fever. Transmission is commonly by direct or indirect contact, or from a disturbance of the normal bacterial flora of the colon. Confirmation is by identification of Clostridioides difficile in a faecal sample.

Exclusions: Necrotising enterocolitis of newborn (KB88)

1A05 **Intestinal infections due to Yersinia enterocolitica**

A disease of the intestinal tract, caused by an infection with the gram-negative bacteria Yersinia enterocolitica. This disease commonly presents with a fever, diarrhoea, or abdominal pain. This disease may also lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected individuals or animal. Confirmation is by identification of Yersinia enterocolitica in a faecal sample.

Exclusions: Extraintestinal yersiniosis (1B9A)

Coded Elsewhere: Postinfectious arthropathy in enteritis due to Yersinia enterocolitica (1A05)

1A06 **Gastroenteritis due to Campylobacter**

1A07 **Typhoid fever**

A condition caused by an infection with the gram-negative bacteria Salmonella typhi. This condition is characterised by an acute sustained fever. This condition may present with weakness, stomach pains, headache, loss of appetite, or flat, rose-coloured spots. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of Salmonella typhi in a faecal or blood sample.

1A07.0 **Typhoid peritonitis**

1A07.Y **Other specified typhoid fever**

1A07.Z **Typhoid fever, unspecified**

1A08 **Paratyphoid fever**

A condition caused by an infection with the gram-negative bacteria Salmonella paratyphi. This condition is characterised by an acute sustained fever. The individual may feel weak, have stomach pains, headache, loss of appetite, or a rash of flat, rose-coloured spots. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of Salmonella paratyphi in a faecal or blood sample.

1A09 **Infections due to other Salmonella**

Coding Note: Infection or foodborne intoxication due to any Salmonella species other than S. typhi and S. paratyphi

1A09.0 Salmonella enteritis

This refers to inflammation of the small intestine due to infection with bacteria of the genus Salmonella, a member of the family Enterobacteriaceae. Bacteria of the genus Salmonella are rod-shaped, Gram-negative, non-spore-forming and predominantly motile.

1A09.Y Infections due to other Salmonella in other organs

Coding Note: Infection or foodborne intoxication due to any Salmonella species other than S. typhi and S. paratyphi

1A09.Z Salmonella infection, unspecified

Coding Note: Infection or foodborne intoxication due to any Salmonella species other than S. typhi and S. paratyphi

1A0Y **Other specified bacterial intestinal infections**

1A0Z **Bacterial intestinal infections, unspecified**

Bacterial foodborne intoxications (1A10-1A1Z)

Any condition caused by an infection with a bacterial source. Transmission is by ingestion of contaminated food.

Exclusions:

salmonella foodborne intoxication and infection (1A09)

Listeriosis (1C1A)

Harmful effects of or exposure to noxious substances, Substances chiefly nonmedicinal as to source, Other noxious substances eaten as food (NE61)

Ichthyotoxism not specified as bacterial (NE61)

1A10 **Foodborne staphylococcal intoxication**

1A11 **Botulism**

A disease caused by an infection with the gram-positive bacteria Clostridium botulinum. This disease commonly presents with abdominal pain, vomiting, acute paralysis, blurred vision, diplopia, and may be fatal. Transmission is by ingestion of contaminated food, direct contact, or from accidental overdose. Confirmation is by identification of Clostridium botulinum in a faecal or food sample.

1A11.0 **Foodborne intoxication by botulinum toxin**

1A11.1 **Other forms of botulism**

1A11.Z **Botulism, unspecified**

1A12 **Foodborne Clostridium perfringens intoxication**

Inclusions: enteritis necroticans

foodborne Clostridium welchii intoxication

1A13 **Foodborne Bacillus cereus intoxication**

1A1Y **Other specified bacterial foodborne intoxications**

1A1Z **Bacterial foodborne intoxications, unspecified**

Viral intestinal infections (1A20-1A2Z)

Any condition of the intestines, caused by an infection with a viral source.

Exclusions: influenza with involvement of gastrointestinal tract (1E32)

Coded Elsewhere: Herpes simplex virus duodenitis (1F00.Y)

Human immunodeficiency virus disease enteritis (1C62.2)

1A20 **Enteritis due to Adenovirus**

A disease of the intestinal tract, caused by an infection with adenovirus. This disease is characterised by a fever, diarrhoea, or vomiting. Transmission is by the faecal-oral route.

1A21 **Gastroenteritis due to Astrovirus**

1A22 **Gastroenteritis due to Rotavirus**

A disease of the gastrointestinal tract, caused by an infection with rotavirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of rotavirus.

1A23 **Enteritis due to Norovirus**

A disease of the gastrointestinal tract, caused by an infection with norovirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of norovirus.

1A24 **Intestinal infections due to Cytomegalovirus**

A condition of the intestinal tract, caused by an infection with cytomegalovirus. The condition is characterised by diarrhoea, fever, abdominal pain, or haematochezia. Transmission is by direct contact with infected body fluids.

1A2Y **Other specified viral intestinal infections**

1A2Z **Viral intestinal infections, unspecified**

Protozoal intestinal infections (1A30-1A3Z)

Any condition of the intestines, caused by an infection with a protozoal parasitic source.

1A30 **Infections due to Balantidium coli**

Any condition caused by an infection with the protozoan parasite Balantidium coli.

1A31 **Giardiasis**

A condition caused by an infection with the protozoan parasite Giardia. This condition is characterised by gastroenteritis, or may be asymptomatic. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of Giardia in a faecal sample.

1A32 **Cryptosporidiosis**

Any condition caused by an infection with the protozoan parasite Cryptosporidium.

1A33 **Cystoisosporiasis**

A disease caused by the protozoan parasite Cystoisospora belli. This disease is characterised by watery diarrhoea, fever, abdominal pain, nausea, or malaise. Transmission is by the faecal-oral route, commonly through the ingestion of contaminated food or water. Confirmation is by identification of Cystoisospora belli in a faecal sample.

1A33.0 Cystoisosporiasis of small intestine

Inclusions: Infection due to Isopora belli

Infection due to Isopora hominis

1A33.1 Cystoisosporiasis of colon

Isosporiasis of colon is a large intestinal inflammation caused by the protozoan Isospora belli.

1A33.Y Other specified cystoisosporiasis

1A33.Z Cystoisosporiasis, unspecified

1A34 **Sarcocystosis**

Any condition caused by an infection with the protozoan parasite Sarcocystis.

Inclusions: Sarcosporidiosis

1A35 **Blastocystosis**

1A36 **Amoebiasis**

Inclusions: infection due to Entamoeba histolytica

1A36.0 Intestinal infections due to Entamoeba

1A36.00 Acute amoebiasis

A disease caused by an infection with the protozoan parasite Entamoeba histolytica. This disease is characterised by fever, abdominal pain, tenesmus, or diarrhoea containing blood. Transmission is by the faecal-oral route or ingestion of contaminated food or water. Confirmation is by identification of Entamoeba histolytica in a faecal or blood sample.

Inclusions: amoebic dysentery

1A36.01 Amoeboma of intestine

Coded Elsewhere: Amoeboma of large intestine (1A36.0Z)

1A36.0Z Intestinal infections due to Entamoeba, unspecified

1A36.1 **Extraintestinal infections due to Entamoeba**

1A36.10 Amoebic liver abscess

Inclusions: Hepatic amoebiasis

1A36.11 Amoebic lung abscess

1A36.12 Cutaneous amoebiasis

1A36.1Y Amoebiasis of other specified sites

1A36.Z **Amoebiasis, unspecified**

1A3Y **Other specified protozoal intestinal infections**

1A3Z **Protozoal intestinal infections, unspecified**

1A40 **Gastroenteritis or colitis without specification of infectious agent**

Inclusions: enteritis septic

gastroenteritis septic

Exclusions: Noninfectious neonatal diarrhoea (KB8C)

noninfective diarrhoea (ME05.1)

1A40.0 **Gastroenteritis or colitis without specification of origin**

There is no mention whether the gastroenteritis or colitis is infectious or non-infectious.

1A40.Z **Infectious gastroenteritis or colitis without specification of infectious agent**

Predominantly sexually transmitted infections (1A60-1A9Z)

Exclusions: Nonspecific and nongonococcal urethritis (GC02.1)

Arthropathy following genitourinary infection (FA11.2)

Coded Elsewhere: Sexually transmissible viral hepatitis

Herpes simplex labialis (1F00.01)

Herpes simplex gingivostomatitis (1F00.02)

Vulvovaginal candidosis (1F23.10)

Candida balanoposthitis (1F23.11)

Human immunodeficiency virus disease (1C60-1C62.Z)

Other infections with a predominantly sexual mode of transmission complicating pregnancy, childbirth or the puerperium (JB63.3)

Candidosis of external genitalia (1F23.1Y)

Anogenital molluscum contagiosum (1E76)

Syphilis (1A60-1A6Z)

A predominantly sexually transmitted infection caused by Treponema pallidum ssp. pallidum.

Coded Elsewhere: Syphilis complicating pregnancy, childbirth or the puerperium (JB63.1)

1A60 **Congenital syphilis**

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum in utero. This disease may present with clinical signs depending on the stage of disease. Transmission is by vertical transmission.

1A60.0 Early congenital syphilis, symptomatic

A disease affecting newborns or children up to 2 years of age, caused by an infection with the gram-negative bacteria Treponema pallidum pallidum in utero. This disease is characterised by premature birth, hepatosplenomegaly, skeletal abnormalities, and bullous skin disease. Transmission is by vertical transmission.

1A60.1 Early congenital syphilis, latent

1A60.2 Late congenital syphilitic oculopathy

This is a late congenital, sexually transmitted infection caused by the spirochete bacterium Treponema pallidum subspecies pallidum. This diagnosis is with oculopathy.

1A60.3 Late congenital neurosyphilis

Neurological sequelae of longstanding (> 2 years) untreated congenital neurosyphilis include mental delay, hydrocephalus, seizures, cerebral infarction and cranial nerve palsies.

1A60.4 Other late congenital syphilis, symptomatic

1A60.5 Late congenital syphilis, latent

1A60.Z Congenital syphilis, unspecified

1A61 Early syphilis

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum, including primary and secondary stages of syphilis, and early latent syphilis of less than 2 years duration. This disease is characterised by a single chancre in the primary stage, and diffuse rash in the secondary stage. Transmission is commonly by sexual contact.

Exclusions: Early congenital syphilis (1A60)

1A61.0 Primary genital syphilis

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by a single chancre in the genital region. Transmission is commonly by sexual contact.

1A61.1 Primary anal syphilis

1A61.2 Primary syphilis of other sites

1A61.3 Secondary syphilis of skin or mucous membranes

A disease caused by an infection with Treponema pallidum pallidum. This disease is characterised by lesions of the skin and mucous membranes. Transmission is commonly by sexual contact.

1A61.4 Secondary syphilis of other sites

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by less common symptoms of syphilis, including hepatitis, kidney disease, arthritis, periostitis, optic neuritis, uveitis, or interstitial keratitis. Transmission is commonly by sexual contact.

1A61.5 Latent early syphilis

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by serologic proof of infection without symptoms of disease less than 1 year after secondary syphilis. Transmission is commonly by sexual contact.

1A61.Y Other specified early syphilis

1A61.Z Early syphilis, unspecified

1A62 Late syphilis

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by gummas, neurological abnormalities, or cardiac abnormalities. Clinical signs normally manifest approximately 3-15 years after initial infection. Transmission is commonly by sexual contact.

Exclusions: Late congenital syphilis (1A60)

1A62.0 **Neurosyphilis**

A disease of the brain or spinal cord caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by four different forms: meningovascular, tabes dorsalis, general paresis, or may be asymptomatic. Clinical signs normally manifest approximately 4-25 years after initial infection. Transmission is commonly by sexual contact.

1A62.00 Asymptomatic neurosyphilis

1A62.01 Symptomatic late neurosyphilis

A diverse constellation of neuropsychiatric signs resulting from prolonged untreated or inadequately treated syphilis. The protean clinical manifestations include chronic, insidious meningeal inflammation with cranial nerve palsy, cognitive and/or behavioural impairment, ataxia, stroke, seizures and visual or auditory impairment.

Coded Elsewhere: Dementia due to neurosyphilis (6D85.Y)

Meningitis due to Treponema pallidum (1D01.0Y)

1A62.0Z Neurosyphilis, unspecified

1A62.1 **Cardiovascular late syphilis**

This is a late, sexually transmitted infection caused by the spirochete bacterium Treponema pallidum subspecies pallidum. This diagnosis is involving the cardiovascular area.

1A62.2 **Symptomatic late syphilis of other sites**

1A62.20 Ocular late syphilis

This is a late, sexually transmitted infection caused by the spirochete bacterium Treponema pallidum subspecies pallidum. This diagnosis is with ocular.

1A62.21 Late syphilis involving the musculoskeletal system

This is a late, sexually transmitted infection caused by the spirochete bacterium Treponema pallidum subspecies pallidum. This diagnosis is involving the musculoskeletal system.

1A62.22 Late syphilis of skin or mucous membranes

This is a late, sexually transmitted infection caused by the spirochete bacterium Treponema pallidum subspecies pallidum. This diagnosis is involving the skin and mucous membranes.

1A62.2Y Symptomatic late syphilis of other specified sites

1A62.2Z Symptomatic late syphilis of unspecified site

1A62.Y **Other specified late syphilis**

1A62.Z **Late syphilis, unspecified**

1A63 **Latent syphilis, unspecified as early or late**

A disease caused by an infection with the gram-negative bacteria Treponema pallidum pallidum. This disease is characterised by serologic proof of infection without symptoms of disease. Transmission is commonly by sexual contact.

Inclusions: Positive serological reaction for syphilis

1A6Z **Syphilis, unspecified**

Gonococcal infection (1A70-1A7Z)

A condition caused by an infection with the gram-negative bacteria Neisseria gonorrhoeae. Transmission is by sexual contact. Confirmation is by identification of Neisseria gonorrhoeae.

Coded Elsewhere: Gonorrhoea complicating pregnancy, childbirth or the puerperium (JB63.2)

1A70 **Gonococcal genitourinary infection**

1A70.0 Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess

Exclusions: Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess (1A70.1)

1A70.00 Gonorrhoea of penis

1A70.0Y Other specified gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess

1A70.0Z Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess, unspecified

1A70.1 Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess

1A70.Y Gonococcal infection of other specified genitourinary organ

1A70.Z Gonococcal genitourinary infection, unspecified

1A71 **Gonococcal pelviperitonitis**

This is an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.

1A72 **Gonococcal infection of other sites**

1A72.0 Gonococcal infection of musculoskeletal system

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the musculoskeletal system.

1A72.1 Gonococcal infection of rectum

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea of the rectum.

1A72.2 Gonococcal infection of anus

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the anus.

1A72.3 Gonococcal pharyngitis

1A72.4 Gonococcal infection of eye

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the eye.

Coded Elsewhere: Neonatal conjunctivitis or dacryocystitis due to Neisseria gonorrhoeae (KA65.0)

1A72.Y Gonococcal infection of other specified sites

1A73 Disseminated gonococcal infection

Disseminated gonococcal infection occurs when there is bacteremic dissemination of Neisseria gonorrhoeae from its initial focus of infection in female pelvic organs. It manifests as pain and swelling around one or more joints, intermittent crops of erythematous papules and pustules on the limbs, fever and rigors. Blood cultures may be but are not always positive.

1A7Z Gonococcal infection, unspecified

Sexually transmissible infections due to chlamydia (1A80-1A8Z)

An infection with the gram-negative bacteria Chlamydia trachomatis. This infection may be asymptomatic or characterised by fever, painful urination, urinary urgency, dyspareunia, vaginal bleeding or discharge, pain in the abdomen in females and by fever, urethritis, painful urination, discharge from the penis, swollen or tender testicles in males. Transmission is by anal, vaginal, or oral sex. Confirmation is by identification of Chlamydia trachomatis.

1A80 Chlamydial lymphogranuloma

A disease of the inguinal lymph glands, caused by an infection with the gram-negative bacteria Chlamydia trachomatis. This disease is characterised by a genital ulcer, buboes, abscesses in the groin, blood in faeces, tenesmus, or proctocolitis. Transmission is by sexual contact. Confirmation is by identification of Chlamydia trachomatis in a blood sample or by polymerase chain reaction tests.

Inclusions: Durand-Nicolas-Favre disease

1A81 Non-ulcerative sexually transmitted chlamydial infection

Exclusions: Neonatal chlamydial pneumonia (KB24)

Neonatal conjunctivitis due to Chlamydia (KA65.0)

Chlamydial lymphogranuloma (1A80)

Chlamydial peritonitis (1C21)

Trachoma (1C23)

1A81.0 Chlamydial infection of lower genitourinary tract

1A81.1 **Chlamydial infection of internal reproductive organs**

1A81.Y **Non-ulcerative sexually transmitted chlamydial infection of other specified site**

1A81.Z **Non-ulcerative sexually transmitted chlamydial infection of unspecified site**

1A8Y **Other specified sexually transmissible infections due to chlamydia**

1A8Z **Sexually transmissible infections due to chlamydia, unspecified**

1A90 **Chancroid**

A disease caused by an infection with the gram-negative bacteria Haemophilus ducreyi. This disease is characterised by painful ulcer(s) on the genitalia. Transmission is by sexual contact. Confirmation is by identification of Haemophilus ducreyi from the ulcer exudate.

Inclusions: Ulcus molle

1A91 **Granuloma inguinale**

A disease caused by infection with the gram-negative bacterium Klebsiella granulomatis. It commonly presents with painless genital ulceration following contact with an infected sexual partner. Small, painless nodules appear after an incubation period of about 10–40 days; later the nodules break down to create open, fleshy, oozing ulcers which gradually extend, mutilating the infected tissue. The lesions occur at the region of contact and are typically found on the shaft of the penis, the labia, or the perineum.

Inclusions: Donovanosis

1A92 **Trichomoniasis**

A disease caused by an infection with the protozoan parasite Trichomonas. This disease presents with symptoms depending on the site of infection.

Coded Elsewhere: Intestinal trichomoniasis (1A3Y)

1A93 **Sexually transmissible infestations**

Coded Elsewhere: Scabies (1G04)

Pubic infestation by Pthirus pubis (1G03)

1A94 **Anogenital herpes simplex infection**

A condition of the anogenital region, caused by an infection with herpes simplex virus type 1 or 2. This condition is characterised by vesicles, or may be asymptomatic. Transmission is by sexual contact. Confirmation is by identification of herpes simplex virus type 1 or 2.

1A94.0 **Herpes simplex infection of genitalia or urogenital tract**

Herpes simplex infection affecting the vulva and vagina in women and the penis in men. It is more commonly due to infection with Herpes simplex type 2 virus than with type 1 virus.

1A94.1 **Herpes simplex infection of perianal skin or rectum**

Herpes simplex infection of perianal skin and rectum. This is commonly due to Herpes simplex virus type 2 and acquired through anal sexual contact.

1A94.Z **Anogenital herpes simplex infection without further specification**

1A95 **Anogenital warts**

Anogenital warts are due to an infection of anogenital skin and mucous membranes by certain human papilloma viruses, most commonly HPV subtypes 6,11,16 and 18. Transmission is predominantly by sexual contact. They manifest typically as flat plaques or papillomatous, keratinous growths on and adjacent to the external genitalia and anus. Some HPV subtypes, including types 16 and 18, are oncogenic and predispose to the development of anogenital cancers.

Inclusions: Condylomata acuminata

Coded Elsewhere: Anogenital verrucous carcinoma of Buschke and Lowenstein (2C31.0)

1A95.0 **Anal warts**

Infection of the anus or perianal skin by human papillomavirus (HPV). Although the majority of such infections are sexually transmitted and caused by HPV subtypes responsible for genital warts, autoinoculation from common warts, especially on the hands in children, may also cause perianal warts.

Inclusions: Condylomata acuminata of anus

1A95.1 **Genital warts**

Infection of anogenital mucosa or skin by the human papillomavirus. The infection is commonly asymptomatic but manifests typically as flat, papular or pedunculated growths depending on the site of infection. Transmission is by normally by sexual contact.

1A95.2 **Extragenital condylomata acuminata**

Anogenital warts transmitted to extragenital sites (i.e. beyond the anogenital region). This may be through autoinoculation of anogenital wart virus to moist, intertriginous sites on the abdomen or under the breasts, or as a result of sexual activity, particularly to the lips and oral cavity.

Inclusions: Anogenital warts affecting sites other than the anogenital area

1A9Y **Other specified predominantly sexually transmitted infections**

1A9Z **Predominantly sexually transmitted infections, unspecified**

Mycobacterial diseases (1B10-1B2Z)

Tuberculosis (1B10-1B1Z)

A disease caused by an infection with bacteria of the Mycobacterium tuberculosis complex. This disease presents with symptoms depending on the site of infection. Transmission is commonly by inhalation of infected respiratory secretions.

Inclusions: Infections due to Mycobacterium tuberculosis and Mycobacterium bovis

Exclusions: Pneumoconiosis associated with tuberculosis (CA60.3)

Coded Elsewhere: Congenital tuberculosis (KA61.0)

Tuberculosis complicating pregnancy, childbirth or the puerperium (JB63.0)

HIV disease clinical stage 1 associated with tuberculosis (1C60.0)

HIV disease clinical stage 2 associated with tuberculosis (1C60.1)

HIV disease clinical stage 3 associated with tuberculosis (1C60.2)

HIV disease clinical stage 4 associated with tuberculosis (1C60.3)

Human immunodeficiency virus disease associated with tuberculosis (1C60)

1B10 Tuberculosis of the respiratory system

This is a progressive or chronic disease resulting from infection with the bacterium Mycobacterium tuberculosis or other bacteria in the M. tuberculosis complex: M. bovis, M. africanum, M. canetti, M. microti and M. pinnipedii. The infection is limited to the respiratory system.

1B10.0 Respiratory tuberculosis, confirmed

A disease of the respiratory tract, caused by an infection with the bacteria Mycobacterium tuberculosis, which has been confirmed by laboratory testing. This disease is characterised by chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by identification of Mycobacterium tuberculosis in clinical samples.

1B10.1 Respiratory tuberculosis, not confirmed

A disease of the respiratory tract, caused by an infection with the bacteria Mycobacterium tuberculosis, which has not been confirmed. This disease is characterised by a chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions.

1B10.Z Respiratory tuberculosis, without mention of bacteriological or histological confirmation

1B11 Tuberculosis of the nervous system

A disease of the central nervous system, caused by an infection with bacteria of the Mycobacterium tuberculosis complex. This disease is characterised by neurological deficits depending on the site affected. Transmission is through haematogenous spread to the nervous system after inhalation of infected respiratory secretions. Confirmation is by identification of bacteria of the Mycobacterium tuberculosis complex in the cerebrospinal fluid.

1B11.0 **Tuberculous meningitis**

A disease of the meninges, caused by an infection with the bacteria Mycobacterium tuberculosis. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges after inhalation of infected respiratory secretions. Confirmation is by identification of Mycobacterium tuberculosis in the cerebrospinal fluid.

Inclusions: Tuberculous leptomeningitis

1B11.1 **Tuberculous meningoencephalitis**

1B11.2 **Meningeal tuberculoma**

Tuberculomas are conglomerate caseous foci within the substance of the brain, caused by dissemination of tuberculosis to the central nervous system.

Inclusions: Tuberculoma of meninges

1B11.3 **Tuberculous granuloma of brain**

1B11.4 **Tuberculous granuloma of the meninges**

1B11.Y **Tuberculosis of other specified part of nervous system**

1B11.Z **Tuberculosis of the nervous system, unspecified**

1B12 Tuberculosis of other systems and organs

1B12.0 **Tuberculosis of heart**

Mycobacterium tuberculosis infection involving the heart and pericardium

1B12.1 **Tuberculosis of eye**

Tuberculosis involving the eye. This may manifest in multiple different ways including keratoconjunctivitis, episcleritis, anterior uveitis and posterior uveitis

Exclusions: lupus vulgaris of eyelid (1B12.8)

1B12.2 **Tuberculosis of ear**

This is a common, and in many cases lethal, infectious disease caused by various strains of mycobacteria, usually Mycobacterium tuberculosis. This diagnosis is of the ear.

Exclusions: tuberculosis of skin of external ear (1B12.8)

Tuberculous mastoiditis (1B12.40)

1B12.3 **Tuberculosis of endocrine glands**

Infection of endocrine glands by Mycobacterium tuberculosis with resultant endocrine disturbances including adrenal or pituitary failure.

Coded Elsewhere: Tuberculous Addison disease (1B12.3)

1B12.4 **Tuberculosis of the musculoskeletal system**

Coded Elsewhere: Mycobacterial infection of vertebra (FA90.1)

1B12.40 Tuberculosis of bones or joints

A disease of the bones and joints, caused by an infection with the bacteria Mycobacterium tuberculosis. This disease commonly presents with bone pain, joint inflammation, loss of movement or feeling in the affected bone or joint, and weak bones prone to fracture. Transmission is through haematogenous spread to the bones and joints after inhalation of infected respiratory secretions. Confirmation is by identification of Mycobacterium tuberculosis in biopsy samples of the affected site.

1B12.41 Tuberculous myositis

1B12.4Y Tuberculosis of other specified part of the musculoskeletal system

1B12.4Z Tuberculosis of the musculoskeletal system, unspecified

1B12.5 **Tuberculosis of the genitourinary system**

Tuberculosis involving the urinary tract and/or reproductive organs. The primary site of infection is most commonly the kidney as a result of haematogenous spread from distant sites: infection may then spread further down the urinary tract and/or to the reproductive organs. Genital infection may be sexually transmitted.

1B12.6 **Tuberculous peripheral lymphadenopathy**

A disease of the peripheral lymph nodes, caused by an infection with the bacteria Mycobacterium tuberculosis. This disease is characterised by inflammation of the peripheral lymph nodes, typically the cervical lymph nodes. Transmission is through haematogenous spread to the peripheral lymph nodes after inhalation of infected respiratory secretions. Confirmation is by identification of Mycobacterium tuberculosis from lymph node biopsies.

Inclusions: Tuberculous adenitis

Exclusions: Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically or histologically (1B10.0)

Tuberculosis of intrathoracic lymph nodes, without mention of bacteriological or histological confirmation (1B10)

1B12.7 **Tuberculosis of the digestive system**

Tuberculosis of the digestive tract or hepatobiliary system

1B12.8 **Cutaneous tuberculosis**

Tuberculosis involving the skin and mucous membranes including lupus vulgaris, scrofuloderma and periorificial tuberculosis.

Exclusions: Tuberculids (EA40-EA5Z)

Skin complications of BCG immunisation (EA51)

Coded Elsewhere: Acute miliary cutaneous tuberculosis (1B13.0)

1B12.Y **Tuberculosis of other specified organ or site**

1B13 Miliary tuberculosis

1B13.0 **Acute miliary tuberculosis of a single specified site**

A disease caused by an infection with the bacteria Mycobacterium tuberculosis that is disseminated through the body, and affecting a specific body site. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in any organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, CT, ultrasonography, and identification of Mycobacterium tuberculosis, depending on the site affected.

1B13.1 **Acute miliary tuberculosis of multiple sites**

A disease caused by an infection with the bacteria Mycobacterium tuberculosis that is disseminated through the body, and affecting multiple body sites. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in more than one organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, advanced imaging, ultrasonography, and identification of Mycobacterium tuberculosis, depending on the sites affected.

1B13.2 **Acute miliary tuberculosis, unspecified site**

1B13.Y **Other specified miliary tuberculosis**

1B13.Z **Miliary tuberculosis, unspecified**

1B14 **Latent tuberculosis**

1B1Y **Other specified tuberculosis**

1B1Z **Tuberculosis, unspecified**

1B20 **Leprosy**

A disease caused by an infection with Mycobacterium leprae. This disease commonly presents with a long asymptomatic period followed by granulomatous lesions of the skin, respiratory tract, and peripheral nerves. Transmission is commonly by droplet transmission. Confirmation is by identification of Mycobacterium leprae with skin biopsy.

Inclusions: Infection due to Mycobacterium leprae

1B20.0 **Paucibacillary leprosy**

1B20.1 **Multibacillary leprosy**

1B20.2 **Leprosy reactions**

1B20.20 Type I leprosy reaction

This phenomenon, also named “upgrading reaction,” occurs in borderline leprosy states and is associated with an increase in cell-mediated immunity. It occurs typically within the first 6 months of treatment in previously untreated patients but may be related to stress, intercurrent infections, or pregnancy. Clinical features include inflammatory swelling, erythema and occasionally ulceration of existing lesions, constitutional symptoms and neuritis. If the neuritis is not treated promptly permanent motor nerve damage may ensue.

1B20.21 Type II leprosy reaction

This phenomenon, also named downgrading reaction, occurs in borderline leprosy states and is associated with a decrease in cell-mediated immunity with a shift towards the lepromatous end of the clinical spectrum.

1B20.3 Complications of leprosy

1B20.Z Leprosy, unspecified

1B21 Infections due to non-tuberculous mycobacteria

Any condition caused by an infection with Mycobacteria excluding infections due to Mycobacterium tuberculosis complex and Mycobacterium leprae. These conditions commonly present with lung disease; however, symptoms are dependent on the site of infection. Transmission is by direct contact with non-tuberculous Mycobacteria in the environment. Confirmation is by identification of non-tuberculous Mycobacteria from the affected site(s).

Exclusions: Leprosy (1B20)

Tuberculosis (1B10-1B1Z)

1B21.0 Pulmonary infection due to non-tuberculous mycobacterium

A condition of the pulmonary system, caused by an infection with the bacteria Mycobacterium (excluding infections due to Mycobacterium tuberculosis and Mycobacterium leprae). This disease is characterised by cough, fever, weight loss, and fatigue. Transmission is by direct contact with Mycobacterium in the environment.

1B21.1 Non-tuberculous mycobacterial lymphadenitis

1B21.2 Cutaneous non-tuberculous mycobacterial infection

Exclusions: Leprosy (1B20)

Tuberculosis (1B10-1B1Z)

1B21.20 Mycobacterium ulcerans infection

Mycobacterium ulcerans infection (Buruli ulcer) typically presents as a subcutaneous nodule which breaks down to form a deep painless ulcer which commonly reaches a size of 15 cm in diameter but may extend further to cause extensive tissue damage. The organism is found in wetlands of tropical and subtropical regions of the world, particularly Africa [Dermatology TAG].

1B21.2Y Cutaneous infection due to other specified non-tuberculous mycobacteria

1B21.2Z Cutaneous infection due to unspecified non-tuberculous mycobacteria

1B21.3 Disseminated non-tuberculous mycobacterial infection

1B21.4 Gastrointestinal non-tuberculous mycobacterial infection

1B21.Y Non-tuberculous mycobacterial infection of other specified site

1B21.Z Non-tuberculous mycobacterial infection of unspecified site

1B2Y Other specified mycobacterial diseases

1B2Z **Mycobacterial diseases, unspecified**

Certain staphylococcal or streptococcal diseases (1B40-1B5Z)

Coded Elsewhere: Toxic shock syndrome (1C45)
Streptococcal tonsillitis (CA03.0)
Rheumatic myocarditis (BC42.3)
Chronic rheumatic pericarditis (BB21)
Acute staphylococcal tonsillitis (CA03.Y)

Acute rheumatic fever (1B40-1B42)

A disease of the connective tissue, caused by an infection with the gram-positive bacteria Streptococcus pyogenes; (the disease may also affect the heart, joints, central nervous system, subcutaneous tissues, or skin). This disease is characterised by fever, polyarthritis, carditis, subcutaneous nodules, or erythema marginatum. Transmission is through haematogenous spread to other parts of the body after direct or indirect contact. Confirmation is by electrocardiography, sedimentation rate, or identification of Streptococcus pyogenes in a blood sample.

Coded Elsewhere: Erythema marginatum rheumaticum (EA50.0)

1B40 **Acute rheumatic fever without mention of heart involvement**

1B40.0 Rheumatic arthritis, acute or subacute

1B40.Y Other specified acute rheumatic fever without mention of heart involvement

1B40.Z Acute rheumatic fever without mention of heart involvement, unspecified

1B41 **Acute rheumatic fever with heart involvement**

A disease of the cardiovascular system, caused as a result of rheumatic fever. Rheumatic heart disease is characterised by repeated inflammation with fibrinous repair. This disease may present with cardinal anatomic changes of the valve including leaflet thickening, commissural fusion, and shortening and thickening of the tendinous cords. Inflammation and valve scarring may also occur. Confirmation is by a thoracic radiography or echocardiography.

Exclusions: Rheumatic mitral valve stenosis (BB60.0)

Rheumatic mitral valve insufficiency (BB61.0)

Rheumatic mitral valve prolapse (BB62.0)

Rheumatic mitral stenosis with insufficiency (BB63.0)

Rheumatic aortic valve stenosis (BB70.0)

Rheumatic aortic valve insufficiency (BB71.0)

Rheumatic aortic stenosis with insufficiency (BB72.0)

Rheumatic tricuspid valve stenosis (BB80.0)

Rheumatic tricuspid valve insufficiency (BB81.0)

Rheumatic tricuspid valve stenosis with insufficiency (BB82.0)

Rheumatic pulmonary valve stenosis (BB90.0)

Rheumatic pulmonary valve insufficiency (BB91.0)

Rheumatic pulmonary valve stenosis with insufficiency (BB92.0)

1B41.0 Acute rheumatic pericarditis

A disease of the pericardium, caused by acute rheumatic fever. This disease is characterised by fever, dry cough, rapid heart rate, fatigue, or low blood pressure. Confirmation is by echocardiography, or thoracic radiography.

1B41.1 Acute rheumatic endocarditis

A disease of the endocardium, caused as a result of acute rheumatic fever. This disease is characterised by a high fever, chills, shortness of breath, rapid or irregular heartbeat, coughing up of blood, abdominal pain or septicaemia. This disease commonly presents with valvular involvement. Confirmation is by echocardiography.

1B41.10 Rheumatic aortitis

1B41.1Y Other specified acute rheumatic endocarditis

1B41.1Z Acute rheumatic endocarditis, unspecified

1B41.2 Acute rheumatic myocarditis

Acute rheumatic myocarditis is cardiac inflammation associated with acute rheumatic fever triggered by an autoimmune reaction to group A streptococci infection resulting in pancarditis involving inflammation of the myocardium, endocardium, and epicardium, usually with left-sided valvar involvement.

1B41.Y Other acute rheumatic heart disease

1B41.Z **Acute rheumatic heart disease, unspecified**

1B42 **Rheumatic chorea**

Sydenham chorea is a movement disorder that occurs with rheumatic fever heumaragic fever. It is characterised by rapid, uncoordinated jerking movements affecting primarily the face, feet and hands. Sydenham's chorea (SC) results from childhood infection with Group A beta-haemolytic Streptococci

Exclusions: Huntington chorea (8A01.10)

1B50 **Scarlet fever**

A disease caused by an infection with the gram-positive bacteria Streptococcus pyogenes. This disease is characterised by a sore throat, fever, and a red rash. Transmission is commonly by inhalation of infected respiratory secretions, direct skin contact, or indirect contact.

Inclusions: Scarlatina NOS

Exclusions: streptococcal sore throat (1B51)

Staphylococcal scarlatina (EA50.3)

1B51 **Streptococcal pharyngitis**

A disease of the pharynx, caused by an infection with the gram-positive bacteria Streptococcus pyogenes. This disease is characterised by fever, sore throat, tonsillar exudates, or large cervical lymph nodes. Transmission is commonly by inhalation of infected respiratory secretions, or indirect contact. Confirmation is by identification of Streptococcus pyogenes from a throat swab.

Inclusions: Streptococcal sore throat

Exclusions: Scarlet fever (1B50)

1B53 **Meningitis due to Streptococcus**

A disease of the meninges, caused by an infection with the gram-positive bacteria genus Streptococcus. This disease commonly presents with nausea, vomiting, photophobia, and confusion. Transmission is through haematogenous spread to the meninges after inhalation of infected respiratory secretions. Confirmation is by identification of Streptococcus in the cerebrospinal fluid.

Inclusions: Streptococcal meningitis

1B54 **Meningitis due to Staphylococcus**

A disease of the meninges, caused by an infection with the gram-positive bacteria genus Staphylococcus. This disease commonly presents with acute inflammation of the meninges causing headache, fever, stiff neck, or neurological deficits. Confirmation is by identification of Staphylococcus in the cerebrospinal fluid.

Inclusions: Staphylococcal meningitis

1B5Y **Other specified staphylococcal or streptococcal diseases**

1B5Z **Staphylococcal or streptococcal diseases, unspecified**

Pyogenic bacterial infections of the skin or subcutaneous tissues (1B70-1B7Y)

Coded Elsewhere: Acute bacterial paronychia (EE12.0)

1B70 **Bacterial cellulitis, erysipelas or lymphangitis**

Diffuse, spreading infections of skin and soft tissues by a range of bacterial organisms, most commonly beta-haemolytic streptococci and Staphylococcus aureus. The clinical presentation is dependent not only on the organism but also on the manner in which it invades the tissues.

Exclusions: Eosinophilic cellulitis (EB30)

1B70.0 Erysipelas

Exclusions: postpartum or puerperal erysipelas (JB40)

1B70.00 Erysipelas of face

1B70.01 Erysipelas of external ear

A rapidly expanding diffuse superficial dermal streptococcal infection involving the external ear. In contrast with infective otitis externa, the skin of the auricle is often initially healthy except at a point of entry for beta-haemolytic streptococci (commonly at a fissure behind the ear or where the ear lobule is attached to the side of the head) and systemic features including fever and malaise are common.

1B70.02 Erysipelas of lower limb

1B70.0Y Erysipelas of other specified site

1B70.1 Streptococcal cellulitis of skin

Exclusions: Orbital cellulitis (9A21.0)
Cellulitis of external ear (AA01)
anal cellulitis (DB70.00)
vulvar cellulitis (GA00.0)
Cellulitis of penis (GB06)
Inflammatory disorders of scrotum (GB07.2)
perirectal cellulitis (DB36.10)
Superficial incisional site infection (NE81.20)

1B70.2 Staphylococcal cellulitis of skin

Exclusions: Orbital cellulitis (9A21.0)
Cellulitis of external ear (AA01)
anal cellulitis (DB70.00)
vulvar cellulitis (GA00.0)
Cellulitis of penis (GB06)
Inflammatory disorders of scrotum (GB07.2)
perirectal cellulitis (DB36.10)
Superficial incisional site infection (NE81.20)

1B70.3 **Ascending bacterial lymphangitis**

A complication of a focal acute pyogenic bacterial infection in which the draining lymphatics become red, inflamed and tender as the result of ascending infection. It is most commonly caused by Streptococcus pyogenes.

1B70.Y **Bacterial cellulitis or lymphangitis due to other specified bacterium**

1B70.Z **Bacterial cellulitis or lymphangitis due to unspecified bacterium**

1B71 Necrotising fasciitis

1B71.0 **Streptococcal necrotising fasciitis**

Exclusions: Neonatal necrotising fasciitis (1B71.2)

Coded Elsewhere: Neonatal streptococcal necrotising fasciitis (1B71.2)

1B71.1 **Polymicrobial necrotising fasciitis**

Exclusions: Neonatal necrotising fasciitis (1B71.2)

1B71.2 **Neonatal necrotising fasciitis**

Neonatal necrotising fasciitis is a life-threatening acute necrotising infection of fascia, subcutaneous tissues, and overlying skin similar to the condition seen in adults. It is rare in neonates but, in contrast to the adult form, tends to affect otherwise healthy babies. It has followed omphalitis, mastitis and postoperative wound infection, though preceding sites of infection are not always found. It has more commonly been associated with Staphylococcus aureus than with streptococcal infection. Gram-negative organisms have also been implicated. It may cause extensive tissue destruction and mortality is high.

1B71.Y **Necrotising fasciitis due to other specified bacterial infection**

1B71.Z **Necrotising fasciitis, unspecified**

1B72 Impetigo

A condition of the skin, commonly caused by a secondary infection with the gram-positive bacteria Staphylococcus aureus or group A beta haemolytic streptococci. This condition is characterised by bullous or non-bullous symptoms. Transmission is by direct contact with an infected individual. Confirmation is by identification of the infectious agent in a skin sample.

Exclusions: impetigo herpetiformis (EA90.40)

Staphylococcal scalded skin syndrome (EA50.2)

Coded Elsewhere: Otitis externa in impetigo (AA3Y)

1B72.0 **Bullous impetigo**

Bullous impetigo is a contagious superficial infection of the skin caused by certain strains of Staphylococcus aureus which release toxins into the local environment which are capable of cleaving desmoglein I, a protein involved in intercellular adhesion of epidermal keratinocytes. In contrast to the very superficial, rapidly shed and rarely observed blisters of non-bullous impetigo, the bullae of bullous impetigo are tense and well demarcated, sometimes reaching several centimetres in diameter before rupture.

Coded Elsewhere: Neonatal bullous impetigo (EH11)

1B72.1 **Non-bullous impetigo**

Non-bullous impetigo is due to superficial skin infection with either Streptococcus pyogenes or Staphylococcus aureus or both. The very superficial blisters which form in the upper epidermis are soon shed and rarely seen (cf. bullous impetigo) so that it normally presents with areas of superficial oozing and crusting on the skin surface. It often following minor skin injury or on skin damaged by a preexisting dermatosis such as atopic eczema or scabies.

1B72.2 **Secondary impetiginisation of the skin**

Secondary infection of dermatoses such as atopic eczema by streptococci or staphylococci.

Coding Note: Code also the causing condition

1B72.Y **Other specified impetigo**

1B72.Z **Impetigo, unspecified**

1B73 Ecthyma

Ecthyma is a superficial ulcerative bacterial pyoderma. It is characterised by small, purulent, shallow, punched-out ulcers with thick, brown-black crusts and surrounding erythema. The commonest form is caused by beta-haemolytic streptococci, often in association with Staphylococcus aureus. It is associated with poor hygiene and malnutrition. Ecthyma gangrenosum is an uncommon severe variant caused by Pseudomonas aeruginosa.

1B73.0 **Streptococcal ecthyma**

1B73.1 **Staphylococcal ecthyma**

Ecthyma due to a monoinfection with Staphylococcus aureus. It is less common that streptococcal ecthyma.

1B73.2 **Ecthyma gangrenosum**

Ecthyma gangrenosum is a potentially life-threatening infection of skin in patients who are immunocompromised through disease or immunosuppressive therapy. It is most commonly caused by Pseudomonas aeruginosa though a variety of other organisms may be implicated. It is characterised by usually painless erythematous macules or plaques which progress to haemorrhagic blistering and necrosis of the skin. Lesions may be multiple and widely disseminated, though the anogenital area is a common site. Pseudomonas can frequently be cultured from the blood.

Coded Elsewhere: Neonatal ecthyma gangrenosum (EH11)

1B73.Y **Other specified ecthyma**

1B73.Z **Ecthyma, unspecified**

1B74 Superficial bacterial folliculitis

Bacterial infection of the follicular ostium manifested as follicular papules and pustules with perifollicular erythema. The most commonly isolated organisms are coagulase-negative staphylococci and Staphylococcus aureus. The infection may be acute but is more commonly subacute or chronic; individual lesions heal without scarring. Commonly affected sites include the scalp, beard area, thighs and buttocks.

1B74.0 **Staphylococcus aureus superficial folliculitis**

Infection of the follicular ostium with Staphylococcus aureus. There is a predilection for hairy areas including the scalp, beard and thighs.

1B74.Y **Superficial bacterial folliculitis due to other specified organism**

1B74.Z **Superficial bacterial folliculitis due to unspecified organism**

1B75 Deep bacterial folliculitis or pyogenic abscess of the skin

Single or multiple focal infections of skin and soft tissues most commonly centred on the hair follicle and most commonly due to Staphylococcus aureus. Pyogenic abscesses may develop in other locations in skin which has been injured as a result of either trauma or surgery.

1B75.0 **Furuncle**

A localised infection of a hair follicle by Staphylococcus aureus. It manifests as a painful swollen purulent mass centred on a hair follicle.

1B75.1 **Carbuncle**

A deep follicular pyogenic staphylococcal skin infection involving a group of adjacent hair follicles. It manifests as a painful boggy mass containing multiple purulent discharging sinuses.

1B75.2 **Furunculosis**

The presence of multiple furuncles, this condition is associated with disorders such as malnutrition and diabetes mellitus. Treatment-resistant furunculosis may be associated with Panton-Valentine leucocidin-producing Staphylococcus aureus.

1B75.3 **Pyogenic abscess of the skin**

A pus-producing abscess of the skin most commonly due to bacterial infection by Staphylococcus aureus. It is prone to develop where the normal anatomy is disturbed as in pilonidal disease, an epidermoid cyst or around foreign bodies such as surgical sutures.

Coded Elsewhere: Sacrococcygeal pilonidal abscess (EG63.2)

Infected epidermoid cyst (EK70.00)

1B75.4 **Chronic deep bacterial folliculitis**

A chronic pyogenic infection by Staphylococcus aureus involving the whole depth of the hair follicle. Sycosis occurs mostly in males after puberty, and commonly involves the follicles of the beard. Most cases begin in the third or fourth decade. Unknown host factors appear to be important in the chronicity of the infection. Extensive follicular destruction and scarring may ensue (lupoid sycosis).

Coded Elsewhere: Folliculitis cruris pustulosa atrophicans (ED81.0)

1B7Y **Other specified pyogenic bacterial infection of skin and subcutaneous tissue**

Certain zoonotic bacterial diseases (1B90-1B9Z)

This is a group of bacterial diseases that are transmitted to humans by contact with infected vertebrate animals.

1B90 **Rat-bite fevers**

Any disease caused by an infection with the gram-negative bacteria Streptobacillus moniliformis or gram-negative bacteria Spirillum minus. This disease presents with symptoms depending on the bacterial agent. Transmission is through the bite of an infected rat or rodent.

1B90.0 **Spirillosis**

A disease caused by an infection with the gram-negative bacteria Spirillum minus. This disease is initially characterised by local inflammation, followed by fever, lymphadenitis, and headache. Transmission is commonly by direct contact through the bite or scratch of an infected rat. Confirmation is by identification of Spirillum in blood or tissue samples.

Inclusions: Sodoku

1B90.1 **Streptobacillosis**

A disease caused by an infection with the gram-negative bacteria Streptobacillus moniliformis. This disease is characterised by systemic illness with fever, chills, rash, and polyarthralgias. Transmission is commonly by direct contact through the bite or scratch of an infected rat. Confirmation is by identification of Streptobacillus in blood or joint samples.

Inclusions: Epidemic arthritic erythema

Haverhill fever

Streptobacillary rat-bite fever

1B91 **Leptospirosis**

A disease caused by an infection with the gram-negative bacteria Leptospira. In the first phase, this disease is characterised by generalised illness (fever, chills, or myalgias) or individuals may be asymptomatic; in the second phase, the heart, liver, kidneys, or brain may be affected by the infection (symptoms are dependent on the site affected). Transmission is by ingestion of contaminated food or water, droplet transmission, or direct cutaneous contact. Confirmation is by identification of Leptospira in samples from the affected individual.

1B92 **Glanders**

A disease caused by an infection with the gram-negative bacteria Burkholderia mallei. This disease presents with symptoms depending on the route of infection. Transmission is by contact with tissues or body fluids from infected animals (typically horses), or inhalation of infected aerosol. Confirmation is by identification of Burkholderia mallei in blood, sputum, urine, or skin samples.

Inclusions: Infection due to Pseudomonas mallei

1B93 **Plague**

A disease caused by an infection with the gram-negative bacteria Yersinia pestis. This disease presents with symptoms depending on the site of infection, and may be fatal. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.

1B93.0 Bubonic plague

A disease caused by an infection with the gram-negative bacteria Yersinia pestis. This disease commonly presents with an infection of the lymph nodes leading to swelling and pain. This disease may also present with gangrene of the extremities, chills, malaise, high fever, muscle cramps, or seizures. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.

1B93.1 Cellulocutaneous plague

Cellulocutaneous plague is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) involving the skin around the flea bite which transmitted the pathogen.

1B93.2 Pneumonic plague

Pneumonic plague is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) involving the lung. The lungs are seeded by hematogenous spread or from inhalation of the pathogen.

1B93.3 Plague meningitis

Plague meningitis is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) that involves the central nervous system.

1B93.Y Other specified plague

1B93.Z Plague, unspecified

1B94 **Tularaemia**

A disease caused by an infection with Francisella tularensis. This disease is characterised by fever, chills, headache, and weakness, as well as other symptoms depending on the route of infection. Transmission is through the bite of an infected tick or deer fly, by ingestion of contaminated water or food, airborne transmission, or by direct contact with infected animals. Confirmation is by identification of Francisella tularensis, or the presence of antibodies to Francisella tularensis, in a blood or sputum sample.

Inclusions: deer-fly fever

rabbit fever

infection due to Francisella tularensis

1B94.0 Ulceroglandular tularaemia

1B94.Y Other specified tularaemia

1B94.Z Tularaemia, unspecified

1B95 **Brucellosis**

A disease caused by an infection with the gram-negative bacteria Brucella. This disease is characterised by fever, muscular pain, or sweating. Transmission is by ingestion of unpasteurized milk and soft cheeses made from infected animals. Confirmation is by identification of Brucella or antibodies to Brucella.

Inclusions: Malta fever

Mediterranean fever

undulant fever

Coded Elsewhere: Spondylitis in brucellosis (FA13)

1B96 **Erysipeloid**

A disease caused by an infection with the gram-positive bacteria Erysipelothrix rhusiopathiae. This disease is characterised by localised cellulitis. Transmission is by direct cutaneous contact with Erysipelothrix rhusiopathiae, often in individuals handling seafood and raw meat.

1B97 **Anthrax**

A disease caused by an infection with the gram-positive bacteria Bacillus anthracis. This disease presents with clinical signs depending on the route of infection. Transmission is by inhalation, ingestion, or cutaneous contact with Bacillus anthracis spores. Confirmation is by identification of Bacillus anthracis in a sample, or detection of antibodies or toxins.

1B98 **Cat-scratch disease**

A disease commonly caused by an infection with the gram-negative bacteria Bartonella henselae. This disease is characterised by regional lymphadenopathy, or fever. Transmission is commonly from the scratch or bite of a cat infested with fleas infected with Bartonella henselae.

Inclusions: Cat-scratch fever

Rochalimaea henselae infection

1B99 **Pasteurellosis**

A disease caused by an infection with the gram-negative bacteria Pasteurella. This disease is characterised by local cellulitis and may lead to other clinical signs depending on the route of infection. Transmission is commonly by direct contact through the bite, scratch, or lick from an infected animal, inhalation of infected respiratory secretions, or ingestion of contaminated meat. Confirmation is by identification of Pasteurella from the affected individual.

1B9A **Extraintestinal yersiniosis**

A disease caused by an infection with the gram-negative bacteria Yersinia enterocolitica, excluding infections in the intestinal tract. This disease presents with symptoms depending on the site of infection, and may lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected animals or humans. Confirmation is by identification of Yersinia enterocolitica from affected tissues.

Exclusions: Enteritis due to Yersinia enterocolitica (1A05)

Plague (1B93)

1B9Z **Unspecified zoonotic bacterial disease**

Other bacterial diseases (1C10-1C4Z)

Coded Elsewhere: Other bacterial infections of the fetus or newborn (KA61)

Bacterial duodenitis (DA51.6Y)

1C10 **Actinomycosis**

A disease commonly caused by an infection with the gram-positive bacteria Actinomyces. This disease is characterised by painful abscesses in the mouth, lungs, and gastrointestinal tract. Transmission is by endogenous infection. Confirmation is by identification of Actinomyces in infected tissue or fluid samples.

Exclusions: Actinomycetoma (1C43)

Coded Elsewhere: Myelitis associated with actinomyces (1D02.0)

1C10.0 Pulmonary actinomycosis

This is a pulmonary infectious bacterial disease caused by Actinomyces species such as Actinomyces israelii or A. gerencseriae. It can also be caused by Propionibacterium propionicus, and the condition is likely to be polymicrobial aerobic anaerobic infection.

1C10.1 Abdominal actinomycosis

This is a cervicofacial infectious bacterial disease caused by Actinomyces species such as Actinomyces israelii or A. gerencseriae. It can also be caused by Propionibacterium propionicus, and the condition is likely to be polymicrobial aerobic anaerobic infection.

1C10.2 Cervicofacial actinomycosis

Cervicofacial actinomycosis is the commonest clinical form of actinomycosis, a sporadically occurring endogenous polymicrobial inflammatory process in which fermentative actinomycetes of the genera Actinomyces (especially A. israelii and A. gerencseriae), Propionibacterium and Bifidobacterium act as the principal pathogens. The typical presentation is a slowly progressive development from painless tissue infiltration and induration of soft tissues of the face and neck to multiple abscesses and draining sinus tracts discharging pus. Actinomycosis is a major factor and indicator of poor prognosis in infected osteoradionecrosis of the jaws following head and neck cancer therapy.

1C10.3 Primary cutaneous actinomycosis

1C10.Y Other specified forms of actinomycosis

1C10.Z Actinomycosis, unspecified

1C11 Bartonellosis

Any infection caused by the gram-negative bacteria Bartonella.

Coded Elsewhere: Cat-scratch disease (1B98)

1C11.0 Carrion disease

Infection by Bartonella bacilliformis which can present as a systemic illness, Oroya fever, or as a benign skin eruption, verruga peruana.

1C11.00 Oroya fever

A disease commonly caused by an infection with the gram-negative bacteria Bartonella bacilliformis. This disease is characterised by severe haemolytic anaemia and transient immunosuppression. This disease may present with fever, malaise, or jaundice. Transmission is through the bite of infected sandflies from the genus Lutzomyia. Confirmation is by identification of Bartonella bacilliformis in a blood sample.

1C11.01 Verruga peruana

A disease caused by an infection with the gram-negative bacteria Bartonella bacilliformis. This disease is characterised by multiple nodular and red-to-purple vascular skin lesions, subsequent to Oroya fever. Transmission is through the bite of infected sandflies from the genus Lutzomyia.

1C11.1 Trench fever

A disease caused by an infection with the gram-negative bacteria Bartonella quintana. This disease is characterised by fever, headache, rash, bone pain, or may be asymptomatic. Transmission is through the bite of infected body lice. Confirmation is by identification of Bartonella quintana in a blood sample. Bartonella quintana was formerly known as Rickettsia quintana.

Inclusions: Quintan fever

1C11.Y Other forms of bartonellosis

1C12 **Whooping cough**

A disease of the upper respiratory tract, caused by an infection with the gram-negative bacteria Bordetella. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Bordetella from nasopharyngeal samples or sputum, or detection of antibodies against Bordetella.

1C12.0 Whooping cough due to Bordetella pertussis

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria Bordetella pertussis. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Bordetella pertussis from nasopharyngeal samples or sputum, or detection of antibodies against Bordetella pertussis.

1C12.1 Whooping cough due to Bordetella parapertussis

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria Bordetella parapertussis. This disease typically presents with a mild clinical presentation of paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Bordetella parapertussis from nasopharyngeal samples or sputum, or detection of antibodies against Bordetella parapertussis.

1C12.Y Other specified whooping cough

1C12.Z Whooping cough, unspecified

1C13 **Tetanus**

A disease of the skeletal muscle fibres, caused by an infection with the gram-positive bacteria Clostridium tetani. This disease is characterised by muscle spasms. Transmission is by direct contact of an open wound.

Exclusions: Obstetrical tetanus (1C14)

Tetanus neonatorum (1C15)

1C14 **Obstetrical tetanus**

A disease caused by an infection with the gram-positive bacteria Clostridium tetani. This disease is characterised by a prolonged contraction of skeletal muscle fibres during pregnancy or within six weeks of termination of pregnancy. Transmission is by direct contact.

1C15 **Tetanus neonatorum**

A disease affecting neonates, caused by an infection with the gram-positive bacteria Clostridium tetani. This disease is characterised by systemic muscle spasms that arise within the first few days after delivery. Transmission is commonly by direct contact or lack of maternal immunity.

1C16 **Gas gangrene**

Gas gangrene or clostridial myonecrosis is a potentially fatal, rapidly progressive necrotizing infection of muscle and soft tissue resulting from bacterial invasion of healthy muscle from adjacent traumatized muscle or soft tissue. The infection originates in a wound contaminated with bacteria of the genus Clostridium. C. perfringens accounts for the majority of cases (over eighty percent), while C. novyi, C. septicum, and C. histolyticum cause most of the other cases.

1C17 **Diphtheria**

A disease commonly of the respiratory system, caused by an infection of the gram-positive bacteria Corynebacterium diphtheriae. This disease is characterised by sore throat, fever, and a pseudomembrane on the tonsils, pharynx, or nasal cavity. Transmission is by inhalation of infected respiratory secretions, or direct cutaneous contact. Confirmation is by identification of Corynebacterium diphtheriae from a throat swab or infected tissue, and by clinical signs.

1C17.0 **Pharyngeal or tonsillar diphtheria**

Inclusions: Diphtheritic membranous angina

1C17.00 Postdiphtheritic paralysis of uvula

1C17.0Y Other specified pharyngeal or tonsillar diphtheria

1C17.0Z Pharyngeal or tonsillar diphtheria, unspecified

1C17.1 **Nasal diphtheria**

1C17.2 **Laryngeal diphtheria**

localised infection of mucous membranes of the larynx caused by toxigenic strains of Corynebacterium diphtheriae; it is characterised by the presence of a pseudomembrane at the site of infection; diphtheria toxin, produced by C. diphtheriae, can cause myocarditis, polyneuritis, and other systemic toxic effects.

Inclusions: Diphtheritic laryngotracheitis

1C17.3 **Cutaneous diphtheria**

Exclusions: Erythrasma (1C44)

1C17.Y **Other specified diphtheria**

1C17.Z **Diphtheria, unspecified**

1C18 **Brazilian purpuric fever**

A disease affecting children, caused by an infection with the gram-negative bacteria Haemophilus aegyptius. This disease is characterised by fever, nausea, vomiting, purpuric lesions, and sepsis, that is preceded by conjunctivitis. Transmission may be by mechanical transmission from infected eye gnats, contact with discharge from infected individuals, or fomites used near the eyes. Confirmation is by identification of Haemophilus influenzae from blood.

Inclusions: Systemic Haemophilus aegyptius infection

1C19 Legionellosis

Legionellosis varies in severity from a mild febrile illness to a serious and sometimes fatal form of pneumonia and is caused by exposure to Legionella species found in water, and potting mixes.

Legionellosis is a generic term describing the pneumonic and non-pneumonic forms of infection with Legionella.

1C19.0 Nonpneumonic Legionnaires' disease

The non-pneumonic form (Pontiac disease) is an acute, self-limiting influenza-like illness usually lasting 2–5 days. The incubation period is from a few and up to 48 hours. The main symptoms are fever, chills, headache, malaise and muscle pain (myalgia).

1C19.1 Legionnaires disease

Legionnaires' disease, the pneumonic form, has an incubation period of 2 to 10 days (but up to 16 days has been recorded in some outbreaks). Initially, symptoms are fever, loss of appetite, headache, malaise and lethargy. Some patients may also have muscle pain, diarrhoea and confusion. There is also usually an initial mild cough, but as many as 50% of patients can present phlegm. Blood-streaked phlegm or hemoptysis occurs in about one-third of the patients. The severity of disease ranges from a mild cough to a rapidly fatal pneumonia. Death occurs through progressive pneumonia with respiratory failure and/or shock and multi-organ failure.

1C1A Listeriosis

A disease caused by an infection with the gram-positive bacteria Listeria. This disease commonly presents with fever and muscle aches, followed by gastrointestinal symptoms.

Inclusions: listerial foodborne infection

Coded Elsewhere: Neonatal listeriosis (KA61.1)

1C1A.0 Cutaneous listeriosis

This is a bacterial infection caused by a Gram-positive, motile bacterium, Listeria monocytogenes. Listeriosis occurs primarily in newborn infants, elderly patients, and patients who are immunocompromised.

1C1A.1 Listerial meningitis or meningoencephalitis

A disease of the meninges or brain, caused by an infection with the gram-positive bacteria Listeria. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges from ingestion of contaminated food. Confirmation is by identification of Listeria from cerebrospinal fluid.

1C1A.Y Other specified listeriosis

1C1A.Z Listeriosis, unspecified

1C1B Nocardiosis

A disease caused by an infection with the gram-positive bacteria Nocardia. This disease presents with symptoms depending on the site of infection (commonly lung, brain, or skin). Transmission is by inhalation of Nocardia from soil or water, or by direct cutaneous contact. Confirmation is by identification of Nocardia in samples from affected sites.

1C1B.0 Pulmonary nocardiosis

A disease of the respiratory system, caused by an infection with the gram-positive bacteria Nocardia. This disease is characterised by chest pain, haemoptysis, fever, weight loss, and cough. Transmission is by inhalation of Nocardia from soil or water. Confirmation is by identification of Nocardia in sputum samples, or lung biopsy.

1C1B.1 Cutaneous nocardiosis

Cutaneous nocardiosis may be due to direct infection of the skin where it presents either as a solitary cold abscess or as a lymphangitic process in which infection spreads up lymphatic channels to form a linear array of suppurative nodules. Skin involvement is also present in a third of cases of systemic nocardiosis.

Exclusions: Actinomycetoma due to Nocardia species (1C43)

1C1B.Y Other specified forms of nocardiosis

1C1B.Z Nocardiosis, unspecified

1C1C Meningococcal disease

This illness is severe and includes infections of the lining of the brain and spinal cord (meningitis) and generalised bloodstream infections (bacteraemia or septicaemia).

Meningococcus bacteria are spread through the exchange of respiratory and throat secretions like spit (e.g., by living in close quarters, kissing). Meningococcal disease can be treated with antibiotics, but quick medical attention is extremely important. Keeping up to date with recommended vaccines is the best defence against meningococcal disease.

Inclusions: Meningococcal infection

Coded Elsewhere: Meningococcal encephalitis (1D00.0)

1C1C.0 Meningococcal meningitis

A condition of the meninges, caused by an infection with the gram-negative bacteria Neisseria meningitidis. This condition is characterised by high fever, stiff neck, severe headache, vomiting, purpura, photophobia, and sometimes chills, altered mental status, or seizures. Transmission is through haematogenous spread to the meninges after droplet transmission or direct contact. Confirmation is by identification of Neisseria meningitidis through a lumbar puncture, agglutination tests, or polymerase chain reaction.

Inclusions: Meningitis due to Neisseria meningitidis

1C1C.1 **Waterhouse-Friderichsen syndrome**

A syndrome of the adrenal glands, commonly caused by an infection with meningococcus Neisseria meningitidis. This syndrome is characterised by bleeding into the adrenal glands due to the severe bacterial infection. This syndrome may present with fever, chills, vomiting, myalgia, or rash, with progression to disseminated intravascular coagulation. Transmission is by direct contact or droplet transmission.

Inclusions: Meningococcal haemorrhagic adrenalitis

1C1C.2 **Meningococcaemia**

A condition caused by an infection with the gram-negative bacteria Neisseria meningitidis that leads to a severe systemic inflammatory response. This condition is characterised by fever, rash, and myalgia. Transmission is by direct contact or droplet transmission. Confirmation is by identification of Neisseria meningitidis in blood samples.

1C1C.20 Acute meningococcaemia

A condition caused by an infection with the gram-negative bacteria Neisseria meningitidis that leads to a severe systemic inflammatory response. This condition is characterised by fever, chills, myalgia, nausea, or petechial rash, with progression to shock and disseminated intravascular coagulation. Transmission is by direct contact or droplet transmission. Confirmation is by identification of Neisseria meningitidis in blood samples.

1C1C.2Y Other specified meningococcaemia

1C1C.2Z Meningococcaemia, unspecified

1C1C.Y **Other specified meningococcal disease**

1C1C.Z **Meningococcal disease, unspecified**

1C1D Yaws

An infectious disease caused by Treponema pallidum subsp pertenue which mainly affects children in rural communities in the humid tropics. It affects the skin and bones, is spread by skin to skin contact, and is not sexually transmitted, but cannot be distinguished serologically from syphilis.

1C1D.0 **Primary yaws**

Primary yaws results from primary inoculation of Treponema pallidum subsp. pertenue into the skin, manifesting 2-12 weeks later as a localised papule (initial, primary or ‘mother' yaw) before developing into a large non-tender ulcerating nodule, often resembling a raspberry (hence the name ‘framboesia’). The primary lesion is most commonly located on the legs and ankles may also be found on the buttocks, arms, hands, and face. It usually heals after 3–6 months and is still present at the onset of the secondary stage in only a minority (9-15%).

Inclusions: Chancre of yaws

Primary framboesia

1C1D.1 **Secondary yaws**

Secondary yaws results from lymphatic and haematogenous spread of Treponema pallidum subsp. pertenue spirochaetes from the initial inoculation site and appears from a few weeks to 2 years after the primary infection. The commonest initial symptoms are non-specific and include arthralgia and malaise. Secondary skin lesions consist of multiple papules and nodules similar to the initial lesion but smaller. They may be localised, regional or generalised; they may ulcerate and on moist areas may mimic syphilitic condylomata lata. Hyperkeratotic plaques on the palms and soles may develop painful fissures and secondary infection, resulting in a characteristic 'crab-like' gait.

1C1D.2 **Tertiary yaws**

Tertiary yaws develops in <10% of untreated infected individuals after and interval of 5 years or more. The late stage skin lesions are characterised by gummatous nodules with necrotic tissue destruction, followed by debilitating scarring and contracture. Destructive osteitis can result in ulceration of the palate and nasopharynx ('gangosa'), or bowing of the tibia (sabre shins). Hypertrophic periostitis at periarticular sites can lead to exostosis of the paranasal maxillae ('goundou').

1C1D.3 **Latent yaws**

Latent yaws is defined as yaws with no clinical signs and only serological evidence of infection (reactive treponemal and non-treponemal tests). Infectious relapses may occur in latent cases for up to 5 and, rarely, 10 years. The total duration of infectivity for an untreated yaws patient, including relapses, is thought to be about 12-18 months.

Inclusions: Yaws without clinical manifestations, with positive serology

1C1E Pinta

A disease of the skin, caused by an infection with the gram-negative bacteria Treponema pallidum carateum. This disease is characterised by hyperkeratosis and hyperpigmentation. Transmission may be by direct contact.

1C1E.0 **Primary lesions of pinta**

The primary stage of pinta is characterised by a sparse eruption of cutaneous papules and erythematous scaly plaques. This stage may last for months to years.

Inclusions: Primary chancre of pinta

1C1E.1 **Intermediate lesions of pinta**

The intermediate stage of pinta develops months to years after the primary stage and is characterised by more extensive lesions (known as pintids) which gradually change from pink to blue, black or grey and become atrophic.

Inclusions: Pintids

1C1E.2 **Late lesions of pinta**

Late lesions of pinta are confined to the skin and are characterised by dyschromia and atrophy. They typically take between two and four years to develop following initial infection. The skin appears mottled and atrophic with numerous irregular and variegated hypermelanotic, hypomelanotic and amelanotic patches typically involving the wrists, palms, ankles, and elbows, as well as the skin around and within old lesions.

Inclusions: Hypomelanosis due to late pinta

1C1E.3 **Mixed lesions of pinta**

1C1F Endemic non-venereal syphilis

Endemic non-venereal syphilis is caused by Treponema pallidum subspecies endemicum and is transmitted by skin-to-skin or mouth-to-mouth contact rather than sexual contact. Children are at greatest risk of infection. Clinical features are similar to venereal syphilis with a primary ulcer (usually in the mouth or on the nipples of breast-feeding women nursing infected children) and, in the secondary stage, a generalised papular rash, oral mucous patches, condylomata lata and generalised lymphadenopathy. Late stage infection is characterised by destructive gummata of the nasopharynx (gangosa), bones and skin.

Inclusions: Bejel

Endemic syphilis

Njovera

1C1G Lyme borreliosis

A tick-borne infection by the spirochaete Borrelia burgdorferi, Lyme borreliosis typically presents with a characteristic rash, erythema chronicum migrans, at an average of seven days after a bite from an infected tick. The rash may be accompanied by flu-like symptoms. Disseminated infection may cause meningitis, cranial neuropathies and carditis amongst other manifestations. Late disease, months to years after initial infection, may present with a pauciarticular arthritis or with encephalomyelitis.

Coding Note: Use additional code if desired, to identify any associated condition.

Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.

1C1G.0 **Early cutaneous Lyme borreliosis**

Borrelia burgdorferi infection involving the skin, typically as erythema migrans, the commonest presentation of Lyme disease.

Coding Note: Use additional code if desired, to identify any associated condition.

1C1G.1 **Disseminated Lyme borreliosis**

Coding Note: Use additional code if desired, to identify any associated condition.

1C1G.10 Lyme neuroborreliosis

1C1G.11 Lyme carditis

1C1G.12 Ophthalmic Lyme borreliosis

1C1G.13 Lyme arthritis

1C1G.14 Late cutaneous Lyme borreliosis

1C1G.1Y Other specified disseminated Lyme borreliosis

Coding Note: Use additional code if desired, to identify any associated condition.

1C1G.1Z Disseminated Lyme borreliosis, unspecified

Coding Note: Use additional code if desired, to identify any associated condition.

1C1G.Y **Other specified Lyme borreliosis**

Coding Note: Use additional code if desired, to identify any associated condition.

Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.

1C1H Necrotising ulcerative gingivitis

Necrotising ulcerative gingivitis (NUG) is a condition affecting the gums that is caused by a bacterial infection. It is a form of periodontal (gum) disease. But unlike other forms, it typically develops quickly and causes moderate to severe pain. "Necrotising" means that the condition destroys tissue. "Ulcerative" refers to sores that can appear on the gums.

Inclusions: Fusospirochaetal gangrene

1C1H.0 **Other Vincent infections**

1C1H.Y **Other specified necrotising ulcerative gingivitis**

1C1H.Z **Necrotising ulcerative gingivitis, unspecified**

1C1J Relapsing fever

1C1J.0 **Tick-borne relapsing fever**

A disease caused by an infection with the bacteria Borrelia. This disease is characterised by repeated episodes of fever, with the febrile episode lasting for approximately 3 days, followed by the afebrile state of approximately 7 days. Transmission is through the bite of an infected soft tick (from the genus Ornithodoros). Confirmation is by identification of spirochete bacteria from a blood smear, bone marrow, or cerebrospinal fluid.

Inclusions: Relapsing fever due to any Borrelia species other than Borrelia recurrentis

1C1J.1 **Louse-borne relapsing fever**

A spirochaetal infection caused by the human to human transmission of Borrelia recurrentis by the human body louse. Epidemics are associated with poor living conditions as may result from famine or war. Episodic fever may progress to severe jaundice, haemorrhage, confusion and death. Confirmation is by identification of Borrelia in blood films.

Inclusions: Relapsing fever due to Borrelia recurrentis

1C20 **Chlamydial conjunctivitis**

Chlamydial conjunctivitis is a sexually transmitted infection of conjunctiva caused by bacteria Chlamydia trachomatis. Bacteria can be passed from an infected mother to baby during vaginal childbirth. The symptoms include that one or both eyes will be red with a sticky discharge and swollen eyelids.

Inclusions: Paratrachoma

1C21 **Chlamydial peritonitis**

This is a sexually transmitted infection that causes an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.

1C22 **Infections due to Chlamydia psittaci**

Any condition caused by an infection with the gram-negative bacteria Chlamydia psittaci. These conditions are characterised by variable clinical presentations such as fever, cough, headaches, chills, fatigue, nausea, vomiting, diarrhoea, or pneumonia. Transmission is commonly by inhalation of aersol contaminated with body fluids from infected birds, or direct contact with infected birds. Confirmation is by identification of Chlamydia psittaci.

Inclusions: Psittacosis

Ornithosis

Parrot fever

Coded Elsewhere: Pneumonia in chlamydia psittaci infection (CA40.0Y)

1C23 **Trachoma**

A disease caused by an infection with the gram-negative bacteria Chlamydia trachomatis. This disease is characterised by a roughening of the inner surfaces of the eyes, and inflammation that may lead to superficial vascularization of the cornea (pannus) and scarring of the conjunctiva. Long term effects include blindness or other visual impairments. Transmission is by direct or indirect contact with the eyes or nose of an infected individual.

1C23.0 Initial stage of trachoma

This refers to the initial stage of an infectious disease caused by the Chlamydia trachomatis bacterium which produces a characteristic roughening of the inner surface of the eyelids.

Inclusions: Trachoma dubium

1C23.1 Active stage of trachoma

This refers to the active stage of an infectious disease caused by the Chlamydia trachomatis bacterium which produces a characteristic roughening of the inner surface of the eyelids.

1C23.Y Other specified trachoma

1C23.Z Trachoma, unspecified

1C2Y **Other specified diseases due to chlamydiae**

1C2Z Diseases due to chlamydiae, unspecified

Rickettsioses (1C30-1C3Z)

Any disease caused by an infection with the gram-negative bacteria Rickettsia. These diseases commonly present with fever, malaise, and rash. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

Coded Elsewhere: Trench fever (1C11.1)

1C30 Typhus fever

A disease caused by an infection with the gram-negative bacteria Rickettsia. This disease is characterised by fever, delirium, back pain, or arthralgia. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

Exclusions: Rickettsiosis due to Ehrlichia sennetsu (1C30-1C3Z)

1C30.0 Epidemic louse-borne typhus fever due to Rickettsia prowazekii

This is a form of typhus so named because the disease often causes epidemics following wars and natural disasters. The causative organism is Rickettsia prowazekii, transmitted by the human body louse (Pediculus humanus corporis). This diagnosis is due to is a species of gram negative, Alpha Proteobacteria, obligate intracellular parasitic, aerobic bacteria that is the aetiologic agent of epidemic typhus, transmitted in the faeces of lice.

1C30.1 Recrudescent typhus

This is a form of typhus so named because the disease often causes epidemics following wars and natural disasters. The causative organism is Rickettsia prowazekii, transmitted by the human body louse (Pediculus humanus corporis).

Inclusions: Brill-Zinsser disease

1C30.2 Typhus fever due to Rickettsia typhi

1C30.3 Typhus fever due to Orientia tsutsugamushi

Inclusions: Tsutsugamushi fever

1C30.Y Other specified typhus fever

1C30.Z Typhus fever, unspecified

1C31 Spotted fever

A disease caused by an infection with the gram-negative bacteria Rickettsia. This disease is characterised by fever, eschar, or rash. Transmission is commonly through the bite of an infected tick.

1C31.0 Spotted fever due to Rickettsia rickettsii

Inclusions: Rocky Mountain spotted fever

Sao Paulo fever

1C31.1 **Spotted fever due to Rickettsia conorii**

Inclusions: Boutonneuse fever
Mediterranean tick fever
African tick typhus
Kenya tick typhus

1C31.2 **Spotted fever due to Rickettsia sibirica**

Inclusions: North Asian tick fever
Siberian tick typhus

1C31.3 **Spotted fever due to Rickettsia australis**

Inclusions: Queensland tick typhus

1C31.Y **Other specified spotted fever**

1C31.Z **Spotted fever, unspecified**

1C32 **Rickettsialpox**

An acute febrile disease caused by Rickettsia akari, which is transmitted from its rodent host by the house-mouse mite Liponyssoides sanguineus. An initial skin lesion at the site of a mite bite, often associated with lymphadenopathy, is followed by fever; a disseminated skin rash appears, which generally does not involve the palms and the soles, and lasts only a few days. Death is uncommon.

Inclusions: Kew Gardens spotted fever

1C33 **Q fever**

A disease caused by an infection with the gram-negative bacteria Coxiella burnetti. This disease is characterised by fever, or may be asymptomatic. Transmission is by inhalation of the bacteria, contact with contaminated milk, urine, faeces, vaginal mucus, or semen of infected animals, or through the bite of an infected tick.

Inclusions: Nine Mile fever
Infection due to Coxiella burnetii
Quadrilateral fever

1C3Y **Other specified rickettsioses**

1C3Z **Rickettsioses, unspecified**

1C40 **Campylobacteriosis**

Campylobacteriosis is caused by Campylobacter bacteria (curved or spiral, motile, non–spore-forming, Gram-negative rods). The disease is usually caused by C. jejuni, a spiral and comma shaped bacterium normally found in cattle, swine, and birds, where it is nonpathogenic, but the illness can also be caused by C. coli (also found in cattle, swine, and birds), C. upsaliensis (found in cats and dogs) and C. lari (present in seabirds in particular).

1C41 **Bacterial infection of unspecified site**

Exclusions: meningococcal infection NOS (1C1C)

chlamydial infection NOS (1C20-1C2Z)

rickettsial infection NOS (1C30-1C3Z)

spirochaetal infection NOS (1C10-1C4Z)

Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

Coded Elsewhere: Acute meningococcaemia (1C1C.20)

Disseminated gonococcal infection (1A73)

1C42 **Melioidosis**

A disease caused by the saprophytic environmental gram-negative bacterium Burkholderia pseudomallei which is found in soil or water in humid tropical regions of the world, especially South-East Asia and northern Australia. It has protean manifestations ranging from fulminant septicaemia with fatal outcome to chronic low grade infection.

1C43 **Actinomycetoma**

Actinomycetoma is a chronic progressive subcutaneous infection caused by implantation of aerobic branching actinomycetes through a skin wound. These organisms are filamentous bacteria which live as saprophytes in soil or on plants; the commonest infecting agents are Nocardia brasiliensis, Actinomadura madurae and Streptomyces somaliensis. The earliest stage of infection is a firm painless nodule but with time the whole area becomes hard and swollen with multiple papules, pustules and draining sinuses on the skin surface. Extension to underlying bones and joints can result in gross deformity.

Inclusions: Mycetoma due to filamentous bacteria

Exclusions: Eumycetoma (1F29)

1C44 **Non-pyogenic bacterial infections of the skin**

Skin infection by bacteria which do not characteristically induce pus formation.

1C45 **Toxic shock syndrome**

Exclusions: endotoxic shock NOS (1G41)

1C45.0 Streptococcal toxic shock syndrome

1C45.1 Staphylococcal toxic shock syndrome

1C45.Y Toxic shock syndrome due to other specified infectious agent

1C45.Z Toxic shock syndrome without specified infectious agent

1C4Y **Other specified bacterial diseases**

1C4Z **Unspecified bacterial disease**

Human immunodeficiency virus disease (1C60-1C62.Z)

A case of HIV infection is defined as an individual with HIV infection irrespective of clinical stage including severe or stage 4 clinical disease, (also known as AIDS) confirmed by laboratory criteria according to country definitions and requirements.

Coded Elsewhere: Congenital human immunodeficiency virus infection (KA62.6)

1C60 **Human immunodeficiency virus disease associated with tuberculosis**

Encephalitis due to Arenavirus (1D6Y)
Encephalitis due to Rubella virus (1F02.0)

1C81 **Acute poliomyelitis**

A disease of the nervous system, caused by human poliovirus. This disease commonly presents with a fever, sore throat, headache, vomiting, or stiffness of the neck and back. This disease may present with an acute onset of flaccid paralysis. Transmission is commonly by the faecal-oral route or direct contact. Confirmation is by identification of poliovirus in a faecal sample or by a lumbar puncture.

1C82 **Rabies**

A disease caused by infection with the rabies virus. This disease is characterised by fever, and headache, followed by neurological symptoms dominated by a furious or paralytic form.

Coded Elsewhere: Encephalitis due to classical rabies virus (1C80)

1C83 **Western equine encephalitis**

1C84 **Eastern equine encephalitis**

1C85 **Japanese encephalitis**

A disease of the brain, caused by an infection with flavivirus. This disease is characterised by fever, headache, meningism, hyperexcitability, or decreased consciousness. This disease may also present with neurological signs such as cranial nerve palsies, tremor and ataxia, parkinsonism, or upper limb paralysis. Transmission is through the bite of an infected mosquito. Confirmation is by identification of flavivirus in a serum sample or cerebrospinal fluid.

1C86 **St Louis encephalitis**

1C87 **Rocio viral encephalitis**

A disease of the brain, caused by an infection with Rocio virus. In the first phase, this disease is characterised by a fever, headache, vomiting, or conjunctivitis; in the second phase, this disease is characterised by neurological symptoms and muscle weakness. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Rocio virus in a serum or cerebrospinal fluid sample.

1C88 **Murray Valley encephalitis**

A disease of the brain, caused by an infection with Murray Valley encephalitis virus. This disease is characterised by fever, headache, nausea, vomiting, tiredness, or may be asymptomatic. Severe cases may present with confusion, fatigue, lack of coordination, or encephalitis. Transmission is through the bite of an infected mosquito. Confirmation is by detection of anti-Murray Valley encephalitis antibodies in a serum sample.

Inclusions: Australian encephalitis

1C89 **Far Eastern tick-borne encephalitis**

1C8A **Central European tick-borne encephalitis**

1C8B **California encephalitis**

Inclusions: California meningoencephalitis

1C8C **Venezuelan equine encephalitis**

1C8D **La Crosse encephalitis**

1C8E **Viral meningitis not elsewhere classified**

Any disease of the meninges, caused by an infection with a viral source.

Coded Elsewhere: Meningitis due to mumps virus (1D80.2)

Measles complicated by meningitis (1F03.2)

Herpes simplex meningitis (1F00.20)

Varicella meningitis (1E90.1)

Neonatal meningitis (KA65.4)

Meningitis due to human immunodeficiency virus (1C62.2)

Meningitis due to rubella virus (1F02.0)

Zoster meningitis (1E91.3)

Viral meningitis due to Epstein-Barr virus (1D81.0)

Viral meningitis due to Cytomegalovirus (1D82.Y)

1C8E.1 Enteroviral meningitis

A disease of the meninges, caused by an infection with enterovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of enterovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

1C8E.2 Meningitis due to adenovirus

A disease of the meninges, caused by an infection with adenovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of adenovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

1C8E.Y Other specified viral meningitis not elsewhere classified

1C8E.Z Viral meningitis not elsewhere classified, unspecified

1C8F **Lymphocytic choriomeningitis**

A disease of the meninges, caused by an infection with lymphocytic choriomeningitis virus. This disease is characterised by fever, stiffness of the neck, malaise, lack of appetite, myalgia, headache, nausea, vomiting, or is asymptomatic. This disease may also present with cough, sore throat, arthralgia, testicular pain, or parotid pain. Transmission is by direct contact with body fluids from an infected rodent, through the bite of an infected rodent, or by droplet transmission. Confirmation is by identification of lymphocytic choriomeningitis virus in a blood or tissue sample.

Exclusions: Encephalitis due to Lymphocytic choriomeningitis virus (1D60-1D6Z)

meningoencephalitis due to Lymphocytic choriomeningitis virus (1D60-1D6Z)

1C8Y **Other specified viral infections of the central nervous system**

1C8Z **Viral infections of the central nervous system, unspecified**

Non-viral and unspecified infections of the central nervous system (1D00-1D0Z)

Any condition of the nervous system, caused by an infection with a bacterial, fungal, parasitic or unspecified source.

Coded Elsewhere: Meningitis due to other and unspecified causes (1D01.Y)

1D00 **Infectious encephalitis not elsewhere classified**

A disease of the brain, caused by an infection.

Coding Note: Code also the causing condition

1D00.0 Bacterial encephalitis

Coded Elsewhere: Tuberculous meningoencephalitis (1B11.1)

Tuberculous encephalitis (1B11.Y)

1D00.1 Fungal encephalitis

1D00.2 Parasitic or protozoal encephalitis

A disease of the brain, caused by an infection with a parasitic or protozoal source.

Coded Elsewhere: Meningoencephalitis due to Toxoplasma gondii (1F57.1)

Encephalitis in African trypanosomiasis (1F51.Z)

Encephalitis due to malaria (1F40.0)

Coding Note: Code also the causing condition

1D01 Infectious meningitis not elsewhere classified

A disease of the meninges, caused by an infection.

Coding Note: Code also the causing condition

1D01.0 **Bacterial meningitis**

Any disease of the meninges, caused by an infection with a bacterial source.

Coding Note: Code also the causing condition

Inclusions: arachnoiditis bacterial
leptomeningitis bacterial
pachymeningitis bacterial

Exclusions: bacterial: meningoencephalitis (1D00.0)
bacterial meningomyelitis (1D02.0)

Coded Elsewhere: Pachymeningitis (8E41)

1D01.00 Meningitis due to Haemophilus influenzae

1D01.0Y Other specified bacterial meningitis

Coding Note: Code also the causing condition

1D01.0Z Bacterial meningitis, unspecified

Coding Note: Code also the causing condition

1D01.1 **Fungal meningitis**

A disease of the meninges, caused by an infection with a fungal agent.

Coded Elsewhere: Coccidioides meningitis (1F25.12)
Candida meningitis (1F23.30)
Aspergillus meningitis (1F20.01)

1D01.10 Meningitis due to Cryptococcus neoformans

Inflammation of the pia and arachnoid and spinal fluid associated with the fungus cryptococcus neoformans. The respiratory tract is the usual portal of entry and meningitis may occur after dissemination to the meninges from the lungs. C neoformans meningitis tends to occur in patients with defective cellular immunity. The meningits usually evolves sub acutely, but may be acute. Clinical features include headache, fever, nausea and vomiting, meningismus, visual disturbances, abnormal mental status, seizures, and raised intracranial pressure. Headache, fever, and stiff neck may be absent. The diagnosis is made by microscopic examination of the spinal fluid, culture of CSF and blood, and the latex agglutination test to detect the capsular polysaccharide antigen in CSF and blood. The organism may be seen on Gram stain or India ink stain of the CSF. The spinal fluid usually shows varuable lymphocytic pleocytosis, a low glucose content, and a high protein level.

1D01.1Y Other specified fungal meningitis

1D01.1Z Fungal meningitis, unspecified

1D01.2 **Parasitic or protozoal meningitis**

Coded Elsewhere: Meningitis due to Cysticercosis (1F70.00)

Coding Note: Code also the causing condition

1D01.Z **Infectious meningitis not elsewhere classified, unspecified**

Coding Note: Code also the causing condition

1D02 Infectious myelitis not elsewhere classified

A disease of the spinal cord, caused by an infection.

Coding Note: Code also the causing condition

1D02.0 **Bacterial myelitis**

Inflammation of the spinal cord caused by a bacterial organism. Common agents causing bacterial myelitis include Mycoplasma pneumoniae, Mycobacterium Tuberculosis, Treponema Pallidum, and Brucella.

Coding Note: Code also the causing condition

1D02.1 **Viral myelitis**

Coding Note: Code also the causing condition

Exclusions: Myelitis due to human immunodeficiency disease (1C60-1C62.Z)

1D02.2 **Fungal myelitis**

Inflammation of the spinal cord caused by fungal agents. Primary pathogens include Cryptococcus neoformans, Coccidioides immitis, Blastomyces dermatitides, Histoplasma capsulatum, Candida, and Aspergillus.

Coding Note: Code also the causing condition

1D02.3 **Parasitic myelitis**

Coding Note: Code also the causing condition

1D02.Y **Other specified infectious myelitis not elsewhere classified**

Coding Note: Code also the causing condition

1D02.Z **Infectious myelitis not elsewhere classified, unspecified**

Coding Note: Code also the causing condition

1D03 **Infectious abscess of the central nervous system**

A focal suppurative process of the brain parenchyma, the intracranial or spinal epidural or subdural space, and less commonly the spinal cord parenchyma. The suppurative process is most commonly associated with bacterial infection, and occasionally with fungal, protozoal, or parasitic infection. Brain abscesses develop most commonly by spread from a contiguous infected site (ear, paranasal sinuses, mastoid air cells, teeth), craniofacial osteomyelitis, and following open head trauma or previous neurosurgical procedure. Haematogenous spread from purulent pulmonary infections, bacterial endocarditis, or other sites of infection, can also cause brain abscess . Patients with intracranial abscess present with variable combinations of headache, altered mental status, focal deficits, and seizures. Fever may be present. Patients with intraspinal abscess present with variable degrees of paraparesis or quadriparesis, sensory impairment below the level of the lesion, altered sphincter function, and back pain. The diagnosis is made by CT or MRI imaging, and may be confirmed by histological examination and culture of the abscess material following neurosurgical drainage. Lumbar puncture is usually contraindicated.

Coding Note: Code also the causing condition

1D03.0 **Intraspinal intramedullary abscess**

Coding Note: Code also the causing condition

1D03.1 **Intraspinal subdural abscess**

Coding Note: Code also the causing condition

1D03.2 **Intraspinal extradural abscess**

Coding Note: Code also the causing condition

1D03.3 **Intracranial abscess**

A condition of the cranial cavity, caused by an infection with a bacterial, viral, or fungal source. This condition is characterised by a focal accumulation of purulent material within the cranial cavity. This condition may present with fever, headache, and focal neurological deficits.

Coding Note: Code also the causing condition

1D03.30 Deep cerebral hemispheric abscess

Coding Note: Code also the causing condition

1D03.31 Abscess of the corpus callosum

Coding Note: Code also the causing condition

1D03.32 Pituitary abscess

Coding Note: Code also the causing condition

1D03.33 Multiple or widespread intracranial abscess

Multiple focal suppurative infections within the cranial cavity, including the epidural and subdural spaces, or in the brain, brainstem or cerebellum. The abscesses are typically surrounded by a vascularised capsule. Cerebritis describes nonencapsulated brain abscesses. The infective agent may be bacterial, fungal, or parasitic. The signs and symptoms are variable but typically present as an expanding mass lesion, over a variable period of time, with headache, fever, and a focal neurologic deficit. Seizures may occur. Diagnosis is made by neuroimaging. Microbiologic diagnosis is made by gram stain and culture of abscess material.

Coding Note: Code also the causing condition

1D03.3Y Other specified intracranial abscess

Coding Note: Code also the causing condition

1D03.3Z Intracranial abscess, unspecified

Coding Note: Code also the causing condition

1D03.4 Intraspinal epidural abscess

A condition of the epidural space, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by a focal accumulation of purulent material within the epidural space. This condition presents with symptoms depending on the location of the abscess. Transmission is through haematogenous spread of the infectious agent commonly from a cutaneous or mucosal source.

Coding Note: Code also the causing condition

1D03.5 Spinal cord abscess

A condition of the spinal cord, caused by an infection with a bacterial, viral, or fungal source. This condition is characterised by a focal accumulation of purulent material within the spinal cord. This condition may present with fever, back pain, and neurological deficits. Transmission is through haematogenous spread of the infectious agent.

Coding Note: Code also the causing condition

1D03.Y Other specified site of infectious abscess of the central nervous system

Coding Note: Code also the causing condition

1D03.Z Infectious abscess of the central nervous system, site unspecified

Coding Note: Code also the causing condition

1D04 Infectious granulomas of the central nervous system

Coded Elsewhere: Tuberculous granuloma of brain (1B11.3)

Tuberculous granuloma of the meninges (1B11.4)

1D04.0 Parasitic intracerebral granuloma

1D04.1 **Intracranial granuloma**

A condition of the cranial cavity, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by an organised collection of macrophages within the cranial cavity. This condition may present with neurological deficits.

1D04.10 Fungal intracranial granuloma

1D04.1Y Other specified intracranial granuloma

1D04.1Z Intracranial granuloma, unspecified

1D04.2 **Intraspinal intramedullary granuloma**

1D04.3 **Intraspinal subdural granuloma**

1D04.4 **Intraspinal extradural granuloma**

1D04.5 **Intraspinal epidural granuloma**

A condition of the epidural space, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by an organised collection of macrophages within the epidural space. This condition may present with neurological deficits.

1D04.Y **Other specified site of infectious granulomas of the central nervous system**

1D04.Z **Infectious granulomas of the central nervous system, site unspecified**

1D05 Infectious cysts of the central nervous system

1D05.0 **Epidural infectious cyst**

A condition of the epidural space, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by a membranous sac that may be filled with gas, fluid, or semi solid material within the epidural space. This condition may present with neurological deficits.

1D05.1 **Subdural infectious cyst**

A condition of the subdural space, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by a membranous sac that may be filled with gas, fluid, or semi solid material between the dura mater and the arachnoid mater. This condition may present with neurological deficits.

1D05.Y **Other specified infectious cysts of the central nervous system**

1D05.Z **Infectious cysts of the central nervous system, unspecified**

1D0Y Other specified non-viral and unspecified infections of the central nervous system

1D0Z Non-viral and unspecified infections of the central nervous system, unspecified

Dengue (1D20-1D2Z)

Dengue is a viral disease transmitted by the bite of a mosquito infected by dengue viruses. It is one disease entity with different clinical presentations and often with unpredictable clinical evolution and outcome. Most patients recover following a self-limiting non-severe clinical course like nausea, vomiting, rash, aches and pains, but a small proportion progress to severe disease, mostly characterised by plasma leakage with or without haemorrhage, although severe haemorrhages or severe organ impairment can occur, with or without dengue shock.

Coded Elsewhere: Myelitis due to Dengue virus (1D02.1)

Encephalitis due to Dengue fever (1C80)

1D20 **Dengue without warning signs**

Inclusions: Dengue haemorrhagic fever Grade 1

Dengue fever without warning signs

Dengue haemorrhagic fever without warning signs

1D21 **Dengue with warning signs**

Clinical warning signs are: abdominal pain or tenderness, mucosal bleeding, lethargy and /or restlessness, rapid decrease in platelet count, increase in haematocrit. Other signs can include: persistent vomiting, visible fluid accumulation, liver enlargement more than 2 cm.

1D22 **Severe dengue**

Clinical signs include: 1. Severe plasma leakage leading to shock (Dengue shock syndrome - DSS) and/or fluid accumulation with respiratory distress. 2. severe bleeding as evaluated by clinician, 3.) severe organ involvement: Liver AST or ALT >=1000, CNS: impaired consciousness, involvement of other organs, as myocarditis or nephritis

1D2Z **Dengue fever, unspecified**

Certain arthropod-borne viral fevers (1D40-1D4Z)

Coded Elsewhere: Dengue (1D20-1D2Z)

Far Eastern tick-borne encephalitis (1C89)

Central European tick-borne encephalitis (1C8A)

Western equine encephalitis (1C83)

Eastern equine encephalitis (1C84)

Japanese encephalitis (1C85)

St Louis encephalitis (1C86)

Rocio viral encephalitis (1C87)

Murray Valley encephalitis (1C88)

1D40 **Chikungunya virus disease**

1D41 **Colorado tick fever**

1D42 **O'nyong-nyong fever**

1D43 **Oropouche virus disease**

A disease caused by an infection with Oropouche virus. This disease is characterised by fever, headache, neck and back pain, joint pain, or photophobia. This disease may also present with bronchitis, nausea, diarrhoea, abdominal pain or burning sensations all over the body. Transmission is through the bite of an infected mosquito or midge. Confirmation is by detection of the Oropouche virus specific antibodies in a serum sample.

Inclusions: Oropouche fever

1D44 **Rift Valley fever**

A disease caused by an infection with Rift Valley fever virus. This disease is commonly asymptomatic. This disease may also present with fever, liver abnormalities, weakness, back pain, or dizziness. Transmission is through the bite of an infected mosquito. Confirmation is commonly by detection of Rift Valley fever virus specific IgM or IgG antibodies in a blood sample.

1D45 **Sandfly fever**

Inclusions: pappataci fever

phlebotomus fever

1D46 **West Nile virus infection**

A condition caused by an infection with West Nile Virus. This condition is common asymptomatic. This condition may present with fever, headache, stiffness of the neck, stupor, disorientation, coma, tremors, convulsions, muscle weakness, or paralysis. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgG or IgM anti-West Nile virus antibodies in a serum sample.

Inclusions: West Nile fever

1D47 **Yellow fever**

A condition caused by an infection with yellow fever virus. This condition is characterised by fever, chills, headache, myalgia, conjunctival congestion, or relative bradycardia. Severe conditions may also present with increasing fever, jaundice, renal failure, or bleeding. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM anti-yellow fever virus antibodies in a serum sample.

1D48 **Zika virus disease**

Zika virus infection is caused by the bite of an infected Aedes mosquito. The most common symptoms of Zika virus infection are mild fever and exanthema (skin rash), usually accompanied by conjunctivitis, muscle or joint pain, and general malaise that begins 2-7 days after the bite of the infected mosquito.

Coded Elsewhere: Congenital Zika virus infection (KA62.0)

1D49 **Crimean-Congo haemorrhagic fever**

A disease caused by an infection with Crimean-Congo haemorrhagic fever virus. The incubation period ranges from 2 to 9 days. Symptoms/signs typically include high fever, headache, malaise, arthralgia, myalgia, nausea, abdominal pain, and rarely diarrhoea. Early signs typically include fever, hypotension, conjunctivitis, and cutaneous flushing or a skin rash. Later, patients may develop signs of progressive haemorrhagic diathesis, such as petechiae, mucous membrane and conjunctival haemorrhage, haematuria, hematemesis, and melena. Lethality may reach 30%. Transmission occurs via bites of infected ticks, by direct contact with infected animal blood, or iatrogenic transmission. Laboratory diagnosis of the infection during the acute phase of illness consists of detection of viral nucleic acid or by isolation of the virus or by demonstration of viral antigen by enzyme-linked immunoassay from serum or plasma samples. In samples collected later during the illness, diagnosis is confirmed by demonstration of specific IgG and IgM antibodies.

1D4A **Omsk haemorrhagic fever**

A disease caused by an infection with the Omsk haemorrhagic fever virus. This disease is characterised by fever, chills, headache, gastrointestinal symptoms and bleeding, or muscle pain with vomiting. In severe cases, this disease may also present with encephalitis. Transmission is through the bite of an infected tick, by direct contact with an infected animal, by the faecal-oral route from an infected animal, or by ingestion of milk from infected goats or sheep. Confirmation is by detection of anti-Omsk haemorrhagic fever virus antibodies in a serum sample.

1D4B **Kyasanur Forest disease**

A disease caused by an infection with Kyasanur Forest disease virus. This disease commonly presents with fever, chills, headache, muscle pain and vomiting, or gastrointestinal symptoms and bleeding. This disease may also present with neurological manifestations such as a severe headache, mental disturbances, tremors, or vision deficits. Transmission is through the bite of an infected tick or by direct contact with an infected animal. Confirmation is by identification of Kyasanur Forest disease virus in a serum sample.

1D4C **Alkhurma haemorrhagic fever**

1D4D **Ross River disease**

A disease caused by an infection with Ross River disease virus. This disease is characterised by arthralgia, with or without arthritis. This disease may also present with fever, fatigue, headache, swollen glands, arthralgia, or maculopapular rash commonly affecting the limbs and trunks. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM or IgG anti-Ross River disease virus antibodies in a serum sample.

Inclusions: Epidemic polyarthritis and exanthema

Ross River fever

1D4E **Severe fever with thrombocytopenia syndrome**

1D4Y **Other specified arthropod-borne viral fevers**

1D4Z **Arthropod-borne viral fever, virus unspecified**

Certain zoonotic viral diseases (1D60-1D6Z)

Coded Elsewhere: COVID-19, virus identified (RA01.0)

1D60 **Filovirus disease**

A severe disease with high lethality caused by filovirus infection. Filovirus disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in pregnant women when infected. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

1D60.0 Ebola disease

A severe disease with high case fatality caused by infection with Ebola virus or a closely related virus. Ebola disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in infected pregnant women. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

1D60.00 Bundibugyo virus disease

Ebola disease caused by Bundibugyo virus.

1D60.01 Ebola virus disease

Ebola disease caused by Ebola virus.

1D60.02 Sudan virus disease

Ebola disease caused by Sudan virus.

1D60.03 Atypical Ebola disease

Coding Note: This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. meningoencephalitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Ebola disease.

1D60.0Y Other specified Ebola disease

1D60.0Z Ebola disease, virus unspecified

1D60.1 Marburg disease

A severe disease with high case fatality caused by infection with Marburg virus or a closely related virus. Marburg disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

1D60.10 Marburg virus disease

Marburg disease caused by Marburg virus or Ravn virus.

1D60.11 Atypical Marburg disease

Coding Note: This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. orchitis, uveitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Marburg disease.

1D60.1Y Other specified Marburg disease

1D60.1Z Marburg disease, virus unspecified

1D60.Y Other specified filovirus disease

1D60.Z **Filovirus disease, virus unspecified**

1D61 Arenavirus disease

Coded Elsewhere: Lymphocytic choriomeningitis (1C8F)

Encephalitis due to Arenavirus (1D6Y)

1D61.0 **Argentinian haemorrhagic fever**

A disease endemic to the Argentine Pampas that is caused by an infection with Junín virus and that is characterised by haemorrhagic and neurological manifestations and high lethality (10-30%). The disease begins with a 6-14 day-lasting prodromic phase. Argentinian haemorrhagic fever presents with fever, myalgia, erythema, conjunctival injection, non-menstrual uterine bleeding, epistaxis, haematemesis, melena, haematuria, or shock. Around 20-30% of patients advance to a neurological and haemorrhagic phase. Survivors have a long convalescence period. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Junín virus from blood or mucosal secretions samples.

1D61.1 **Bolivian haemorrhagic fever**

A disease endemic to Bolivia that is caused by an infection with Machupo virus. Early disease symptoms/signs include fever, mild hypertension, headache, bleeding gums, and fatigue. Advanced signs include mucous membrane haemorrhage, epistaxis, melena, and neurological damage such as tremors, seizures, loss of muscle control, and coma. Onset of disease symptoms occur usually within seven days of infection. The lethality ranges from 18% to 22%. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Machupo virus from blood or mucosal secretions samples.

1D61.2 **Lassa fever**

A disease endemic in large parts of sub-Saharan Western Africa caused by infection with Lassa virus. Infection is mild or asymptomatic in most cases, but can cause severe illness or death. After a prodromal period of 7-10 days (sometimes longer), initial symptoms/signs include fever, malaise, headache, sore throat, vomiting, abdominal pain, and diarrhoea. Subsequently, patients develop high fever, extreme lethargy, oedema of head/neck, encephalopathy, pleural effusion, and ascites. Bleeding into the skin, mucosae and underlying tissues occurs in the severest cases. Deafness occurs in many patients, and the disease is often particularly severe in pregnancy. The overall lethality can reach 15% even among hospitalized patients receiving supportive care. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Lassa virus in blood samples by molecular or serologic methods.

1D61.3 Venezuelan haemorrhagic fever

A disease mainly found in rural areas of central Venezuelan that is caused by an infection with Guanarito virus. Symptoms/signs among patients include fever, malaise, headache, arthralgia, sore throat, vomiting, abdominal pain, diarrhoea, convulsions, and a variety of haemorrhagic manifestations. The majority of patients also develop leukopenia and thrombocytopenia. The overall lethality may reach 30% even in hospitalized patients receiving supportive care. Transmission occurs by by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Guanarito virus from blood or mucosal secretions samples.

1D61.Y Other specified arenavirus disease

1D61.Z Arenavirus disease, unspecified

1D62 Hantavirus disease

An acute zoonotic viral disease characterised by abrupt onset of fever, influenza-like clinical signs (e.g., chills, headache, myalgia, dry cough), gastrointestinal signs (e.g., diffuse abdominal pain, vomiting, diarrhoea), transient troubled vision (acute myopia), lumbalgia due to renal swelling, haemorrhagic manifestations to various degrees sometimes followed by rapidly increasing dyspnoea due to not-cardiogenic acute lung oedema, and/or renal involvement. The latter is characterised by initial, often massive proteinuria and microhaematuria sometimes accompanied by transient renal function impediment. All hantavirus infections are heralded by varying degrees of transient thrombocytopenia, which may serve as an indicator of clinical severity.

1D62.0 Haemorrhagic fever with renal syndrome

Acute zoonotic viral disease with abrupt onset of fever, lower back pain, varying degrees of haemorrhagic manifestations, and renal involvement caused by certain hantaviruses.

Inclusions: Nephropathia epidemica

1D62.1 Hantavirus pulmonary syndrome

A disease of the respiratory system, caused by infection with certain hantaviruses. This disease is characterised by fever, fatigue, myalgia, headache, chills, nausea, vomiting, diarrhoea, or abdominal pain. This disease may also present with coughing and dyspnoea. Transmission is by the faecal-oral route or airborne transmission.

1D62.2 Atypical hantavirus disease

1D62.Y Other specified hantavirus disease

1D62.Z Hantavirus disease, unspecified

1D63 Henipavirus encephalitis

Acute bat-borne disease characterised by fever and headaches. The disease may progress to drowsiness, disorientation, mental confusion, and finally encephalitis (brain swelling) in less than a week. This progression may occur with or without an acute respiratory distress component. The incubation period ranges from 4 to 14 days. Lethality is high.

1D64 **Middle East respiratory syndrome**

A disease caused by an infection with Middle East Respiratory Syndrome coronavirus (MERS-CoA). This disease is characterised by severe acute respiratory illness with fever, cough, and shortness of breath. Confirmation is by identification of Middle East Respiratory Syndrome coronavirus from genetic material.

1D65 **Severe acute respiratory syndrome**

A disease of the respiratory system, caused by an infection with coronavirus. This disease is characterised by fever, headache, cough, myalgia, tachycardia, or diarrhoea. This disease may also lead to pneumonia. Transmission is by direct contact, inhalation of infected respiratory secretions, or airborne transmission. Confirmation is by identification of coronavirus in a blood, stool, respiratory secretions, or body tissue sample.

Exclusions: COVID-19, virus identified (RA01.0)

COVID-19, virus not identified (RA01.1)

1D6Y **Other specified zoonotic viral diseases**

1D6Z **Zoonotic viral disease, virus unspecified**

Certain other viral diseases (1D80-1E1Z)

Coded Elsewhere: Congenital Varicella Zoster virus infection (KA62.2)

Other viral diseases complicating pregnancy, childbirth or the puerperium (JB63.5)

Viral duodenitis (DA51.6Y)

Tahyna fever (1D4Y)

1D80 **Mumps**

A disease caused by an infection with mumps virus. This disease commonly presents with fever, headache, fatigue, or eventually parotitis. Transmission is by contact with respiratory secretions, directly or indirectly.

1D80.0 Mumps without complication

1D80.1 Orchitis due to mumps virus

Within a few days of infection the mumps virus can attack the testicular glands leading to abrupt onset of fever ranging from 39-41 to 41ºC, severe testicular pain, scrotal swelling and erythema. Mumps induced orchitis typically presents 1-2 weeks after parotitis. The virus' infiltration into the testicular glands can cause parenchymal inflammation, separation of seminiferous tubules and perivascular interstitial lymphocyte infiltration. Testicular atrophy can result from a rise in intratesticular pressure. Complications include oligospermia, azoospermia, and asthenospermia, which can contribute to subfertility. Infertility is more common in patients with bilateral mumps orchitis and is estimated to occur in approximately 13% of all patients. Sterility is rarely induced by mumps orchitis.

Inclusions: Mumps orchitis

1D80.2 **Meningitis due to mumps virus**

A disease of the meninges, caused by an infection with mumps virus. This disease is characterised by photophobia, vomiting, fever, arthralgia, headache, stiff neck, convulsions, or seizures. This disease may also present with pale, blotchy skin or a distinctive rash. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions or droplet transmission. Confirmation is by identification of mumps virus in a buccal swab or blood sample.

Inclusions: mumps meningitis

1D80.3 **Encephalitis due to mumps virus**

: An inflammatory process of the brain, frequently with evidence of meningeal involvement, due to infection by mumps virus. The clinical manifestations are usually acute, with fever and variable combinations of convulsions, impaired mental state, and focal deficits. The spinal fluid may show a cellular reaction and elevated protein. Diagnosis is by neuroimaging, spinal fluid analysis and culture, PCR, and serologic tests.

Inclusions: Mumps encephalitis

1D80.4 **Pancreatitis due to mumps virus**

Inclusions: mumps pancreatitis

1D80.Y **Other specified mumps**

1D81 Infectious mononucleosis

A disease typically caused by an infection with Epstein-Barr virus or cytomegalovirus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.

Inclusions: Glandular fever

Gammaherpesviral mononucleosis

1D81.0 **Mononucleosis due to Epstein-Barr virus**

A disease typically caused by an infection with Epstein-Barr virus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.

1D81.1 **Mononucleosis due to cytomegalovirus**

A disease typically caused by an infection with cytomegalovirus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.

1D81.Y **Other specified infectious mononucleosis**

1D81.Z **Infectious mononucleosis, unspecified**

1D82 Cytomegaloviral disease

Any condition caused by an infection with cytomegalovirus. These conditions are commonly asymptomatic. Transmission is by direct contact with infected body fluids.

Coded Elsewhere: Mononucleosis due to cytomegalovirus (1D81.1)
Congenital cytomegalovirus infection (KA62.3)
Intestinal infections due to Cytomegalovirus (1A24)
Cytomegaloviral retinitis (9B72.00)

1D82.0 Cytomegaloviral hepatitis

A disease of the hepatic system, caused by an infection with human cytomegalovirus. This disease is characterised by fever, acute pharyngitis, fatigue, lymphadenopathy, or jaundice. Transmission is by direct contact with infected body fluids. Confirmation of an active infection is by identification of human cytomegalovirus in blood, saliva, urine, or other body tissue samples.

1D82.1 Cytomegaloviral pancreatitis

1D82.Y Other specified cytomegaloviral disease

1D82.Z Cytomegaloviral disease, unspecified

1D83 Epidemic myalgia

A disease caused by an infection with the group B Coxsackie virus. This disease is characterised by pleuritic pain, fever, or muscle swelling. Transmission is by the faecal-oral route.

Inclusions: Bornholm disease

1D84 Viral conjunctivitis

Inflammation, often mild, of the conjunctiva caused by a variety of viral agents. Conjunctival involvement may be part of a systemic infection.

Coding Note: Code also the causing condition

Exclusions: ocular disease herpesviral [herpes simplex] (1F00.1)
Ophthalmic zoster (1E91.1)

Coded Elsewhere: Zoster conjunctivitis (1E91.1)

1D84.0 Conjunctivitis due to adenovirus

A condition of the conjunctiva, caused by an infection with adenovirus. This condition is characterised by itchy eyes, tearing, redness, discharge, or photophobia (with corneal involvement). Transmission is by direct contact, indirect contact, or droplet transmission.

Inclusions: Acute adenoviral follicular conjunctivitis
Swimming-pool conjunctivitis

1D84.1 **Acute epidemic haemorrhagic conjunctivitis**

A disease of the conjunctiva, caused by an infection with enterovirus. This disease is characterised by painful and red eyes, swollen lids, conjunctival follicles, chemosis, or subconjunctival haemorrhage. Transmission is by direct contact, or contact with contaminated water.

1D84.Y **Other specified viral conjunctivitis**

Coding Note: Code also the causing condition

1D84.Z **Viral conjunctivitis, unspecified**

Coding Note: Code also the causing condition

1D85 **Viral carditis**

A disease of the heart, caused by an infection with a viral source. This disease is characterised by fatigue, dyspnoea, palpitations, malaise, or atypical chest discomfort. This disease may also present with sinus tachycardia, cardiomyopathy, idiopathic ventricular arrhythmias, or cardiovascular collapse. Transmission is by endogenous spread or iatrogenic transmission. Confirmation is identification of the viral source in advanced imaging or cardiac biopsy.

Exclusions: Influenzal myocarditis, other influenza virus identified (1E30)

1D85.0 **Dilated cardiomyopathy secondary to viral myocarditis**

1D85.1 **Acute viral carditis**

1D85.2 **Chronic viral carditis**

1D85.3 **Aseptic myocarditis of newborn**

1D85.4 **Coxsackie carditis**

1D85.Y **Other specified viral carditis**

1D85.Z **Viral carditis, unspecified**

1D86 **Viral haemorrhagic fever, not elsewhere classified**

Exclusions: Certain arthropod-borne viral fevers (1D40-1D4Z)

Certain zoonotic viral diseases (1D60-1D6Z)

Viral infection of unspecified site (1D90-1D9Z)

Exclusions: Cytomegaloviral disease (1D82)

Herpes simplex infections (1F00)

1D90 **Adenovirus infection of unspecified site**

Adenovirus infections most commonly cause illness of the respiratory system; however, depending on the infecting serotype, they may also cause various other illnesses and presentations.

1D91 **Enterovirus infection of unspecified site**

Coded Elsewhere: Congenital echovirus infection (KA62.4)
Congenital enterovirus infection (KA62.5)

1D92 **Coronavirus infection, unspecified site**

Exclusions: Severe acute respiratory syndrome (1D65)
COVID-19, virus not identified (RA01.1)
COVID-19, virus identified (RA01.0)

1D93 **Parvovirus infection of unspecified site**

Coded Elsewhere: Congenital parvovirus syndrome (KA62.7)

1D9Y **Other viral infections of unspecified site**

1D9Z **Unspecified viral infection of unspecified site**

1E1Y **Other specified viral diseases**

1E1Z **Unspecified viral disease**

Influenza (1E30-1E32)

Any disease of the respiratory system, caused by an infection with influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of influenza virus from a nasopharyngeal, nose, or throat swab.

1E30 **Influenza due to identified seasonal influenza virus**

Exclusions: Haemophilus influenzae [H. influenzae] meningitis (1D01.00)
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

1E31 **Influenza due to identified zoonotic or pandemic influenza virus**

Influenza, caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission.

For use of this category, reference must be made to the guidelines of the Global Influenza Programme (GIP, www.who.int/influenza/) of WHO.

Coding Note: Influenza caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission limited to the inclusions

Exclusions: Haemophilus influenzae [H. influenzae] meningitis (1D01.00)
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

1E32 **Influenza, virus not identified**

Any disease of the respiratory system, caused by an unidentified strain of influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions.

Inclusions: Influenza specific virus not stated to have been identified

Viral influenza specific virus not stated to have been identified

Exclusions: Haemophilus influenzae [H. influenzae] meningitis (1D01.00)

Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

Viral hepatitis (1E50-1E5Z)

A group of liver diseases caused by infection with one or more of the five hepatitis viruses, hepatitis A virus, hepatitis B virus, hepatitis C virus, hepatitis D virus and hepatitis E viruses. The infection may be recent and present for less than 6 months (acute hepatitis) or present for more than 6 months (chronic hepatitis), in which case progression to cirrhosis and liver cancer can occur. Transmission is by the faecal-oral route including water contamination, sexual transmission, blood and body fluid contamination (parenteral spread) and from mother to baby at the time of birth (vertical transmission). Depending on the virus, diagnosis is confirmed by detection of specific viral antigens, anti-viral antibodies or viral nucleic acids in serum.

Exclusions: Herpes simplex hepatitis (1F00)

Autoimmune hepatitis (DB96.0)

Non-alcoholic steatohepatitis (DB92.1)

Coded Elsewhere: Viral hepatitis complicating pregnancy, childbirth or the puerperium (JB63.4)

Congenital viral hepatitis (KA62.9)

1E50 **Acute viral hepatitis**

A group of liver diseases characterised by liver inflammation and fibrosis, caused by more than 6 months of infection with one or more of hepatitis B virus, hepatitis C virus and hepatitis D virus, with or without HIV. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission of hepatitis B and C viruses is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). In addition to detection of specific antigens (HBsAg) and antibodies (anti-HCV), diagnostic assessment requires assay of viral nucleic acids (HBV DNA, HCV RNA etc).

Exclusions: Infectious liver disease (DB90)

Acute or subacute hepatic failure (DB91)

Chronic viral hepatitis (1E51)

Coded Elsewhere: Cytomegaloviral hepatitis (1D82.0)

Epstein-Barr viral hepatitis (DB90.Y)

1E50.0 Acute hepatitis A

Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis A virus (HAV). Transmission is by the faecal-oral route. Diagnosis is confirmed by presence of IgM-anti-HAV in serum. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severer cases.

Exclusions: Infectious liver disease (DB90)

Acute or subacute hepatic failure (DB91)

1E50.1 Acute hepatitis B

Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis B virus (HBV). Transmission is by sexual, blood and body fluid contamination (parenteral spread), and from mother to baby at the time of birth (vertical transmission). Diagnosis is confirmed by presence of recent acquisition of HBsAg, ideally with IgM-anti-HBc in serum. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severe cases.

1E50.2 Acute hepatitis C

Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis C virus (HCV). Transmission is by blood and body fluid contamination (parenteral spread) in most cases, and rarely by sexual spread or from mother to baby at the time of birth (vertical transmission). Diagnosis is confirmed by presence of recent acquisition of anti-HCV with presence of HCV RNA in serum. Clinical features occur in a minority of cases and are characterised by anorexia, nausea and fever, rarely with jaundice. A high proportion of cases (>70%) develop chronic HCV infection, with liver disease of varying severity.

Coded Elsewhere: Necrolytic acral erythema (EA20)

1E50.3 Acute hepatitis D

Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis D virus (HDV). Transmission only occurs in someone with chronic HBV infection (super-infection) or at the same time as acute hepatitis B (co-infection), and is by blood and body fluid contamination (parenteral spread), and sexual spread. Diagnosis is confirmed by serum IgM-anti-HDV. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severe cases. Acute liver failure occurs in some cases, and a high proportion of cases develops chronic HDV infection.

Coded Elsewhere: Acute hepatitis B with Hepatitis D virus co-infection (1E50.1)

1E50.4 Acute hepatitis E

A disease of the liver, caused by an acute infection with hepatitis E virus. This disease is characterised by nausea. Transmission is commonly by the faecal-oral route. Confirmation is by detection of anti-hepatitis E virus IgM antibodies in an individual's serum.

1E50.Y Other specified acute viral hepatitis

1E50.Z Acute viral hepatitis, unspecified

1E51 **Chronic viral hepatitis**

A disease of the liver, caused by a chronic infection with a hepatotropic virus such as hepatitis B,C,D virus, with or without HIV (for six months or longer). This disease is characterised by fatigue, joint and muscle pain, jaundice, or urine of dark yellow colour. Transmission is by sexual contact, or direct contact with contaminated blood or body fluids. Confirmation is by detection of anti-hepatitis antibodies in the individual's serum.

Exclusions: Alcoholic liver disease (DB94)

Autoimmune hepatitis (DB96.0)

Non-alcoholic fatty liver disease (DB92)

1E51.0 Chronic hepatitis B

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HBsAg, but assessment of severity, prognosis and indication for treatment requires quantification of HBV DNA in serum.

Coded Elsewhere: Chronic hepatitis B, co-infected with hepatitis D virus (1E51.2)

Hepatitis B surface antigen [HBsAg] carrier (1E51.Y)

1E51.00 Chronic hepatitis B with human immunodeficiency virus co-infection

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus and with the human immunodeficiency virus (HIV). Clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension), and outcomes, including hepatocellular carcinoma are worse than for hepatitis B without HIV infection.

1E51.0Y Other specified chronic hepatitis B

1E51.0Z Chronic hepatitis B, unspecified

1E51.1 Chronic hepatitis C

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis C virus. Even at stage of cirrhosis there may be no symptoms. Otherwise, clinical features include fatigue and impaired quality of life, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Chronic hepatitis C increases the risks of type 2 diabetes mellitus and cardiovascular disease, which contribute to increased all-cause mortality. Transmission is by blood and body fluid contamination, rarely by sexual transmission and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HCV RNA in the presence of a positive anti-HCV in serum.

Exclusions: Non-alcoholic fatty liver disease (DB92)

Coded Elsewhere: Chronic hepatitis B, co-infected with hepatitis C virus (1E51.0Y)

Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)

1E51.2 Chronic hepatitis D

Coded Elsewhere: Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)

1E51.3 Chronic hepatitis E

1E51.Y Other specified chronic viral hepatitis

1E51.Z Chronic viral hepatitis, unspecified

1E5Z **Viral hepatitis, unspecified**

Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z)

Infections due to poxvirus (1E70-1E7Z)

1E70 **Smallpox**

A disease caused by an infection with variola virus. This disease is characterised by a maculopapular rash that progresses to vesicles (commonly on the face, arms, and legs), and fever. Transmission is by direct contact. Confirmation is by identification of the variola virus in a skin sample of the rash.

In 1980 the 33rd World Health Assembly declared that smallpox had been eradicated. The classification is maintained for surveillance purposes.

Inclusions: Variola

1E71 **Monkeypox**

A disease caused by an infection with monkeypox virus. In the first phase, this disease is characterised by lymphadenopathy, fever, headache, or malaise; in the second phase, this disease is characterised by a rash that starts as maculopapules and progresses to vesicles, then pustules, followed by crusts (may occur on the face, palms of the hands, soles of the feet, body, and mucous membranes). Transmission is by direct contact with infected animals (including body fluids or lesions), direct contact with body fluid from infected individuals, or through fomites. Confirmation is by identification of monkeypox virus.

Inclusions: mpox

1E72 **Cowpox**

Cowpox is due to infection by an orthopoxvirus. Human disease is caused by cutaneous inoculation from an infected host. Cowpox is endemic in Europe amongst small rodents, particularly wood mice and wood voles. After a seven day incubation it causes a systemic febrile flu-like illness. Lesions are solitary or few, mainly affecting the face and

hands. An initial erythematous papula or blister later forms a crusted eschar which heals slowly leaving a deep pock-like scar.

1E73 **Vaccinia**

A poxvirus which was formerly used to protect against smallpox. Its use as a vaccine can be complicated by a generalised rash secondary to viraemia, accidental infection of other sites or other individuals, progressive infection at the site of vaccination or, rarely, encephalomyelitis and myopericarditis.

1E74 **Buffalopox**

Buffalopox is caused by an orthopox virus related to vaccinia virus. It is acquired in humans by direct inoculation from infected water buffalo. It is generally a mild illness similar to cowpox with just a few lesions on the hands and arms. It leaves minor pock-like scars.

1E75 **Orf**

Orf is a virus infection of the skin contracted from sheep and goats. Orf is caused by a parapox virus which infects mainly young lambs and goats. Human lesions are caused by direct inoculation of infected material. Orf is not uncommon among sheep farmers, shearers, freezing workers, vets and farmers' wives or their children who bottle-feed lambs. They occur most commonly on the fingers, hands or forearms but can appear on the face.

1E76 **Molluscum contagiosum**

A disease of the skin and mucous membranes, caused by an infection with molluscum contagiosum virus. This disease is characterised by papular skin eruptions, commonly 2-3 millimetres in diameter. Transmission is by direct contact.

Exclusions: Viral warts (1E80)

1E7Y **Other specified infections due to poxvirus**

1E7Z **Infections due to poxvirus, unspecified**

Human papillomavirus infection of skin or mucous membrane (1E80-1E8Z)

Infection of the skin and mucous membranes by the human papillomavirus (HPV), the agent responsible for viral warts in humans. Clinical manifestations depend on the virus subtype and the anatomical site involved.

Coded Elsewhere: Anogenital warts (1A95)

1E80 Common warts

Common warts are due to an infection of the epidermis by certain human papilloma viruses, most commonly HPV subtypes 1,2,4,27 and 57. They manifest typically as papillomatous, keratinous growths on the hands and feet but may affect any part of the skin (and also adjacent mucous epithelia). They are very common during childhood and adolescence.

Exclusions: Warts of lips or oral cavity (1E82)

1E80.0 Digital or periungual warts

Viral warts affecting the fingers, thumbs or non-plantar (or non-weight-bearing) skin of the toes. They are often difficult to eradicate, particularly if the nail folds are involved, but most will eventually resolve spontaneously.

Exclusions: Plantar warts (1E80.1)

1E80.1 Plantar warts

Viral warts affecting the plantar surfaces of the feet including the weight-bearing skin of the toes. They are often painful and are difficult to eradicate. In most cases, however, they do eventually resolve spontaneously.

1E80.Y Other specified common warts

1E81 Plane warts

Plane warts (flat warts) are clinically distinct from common warts and manifest as multiple small flat-topped, often lightly pigmented papules on the face or extremities. They are caused by human papillomavirus (HPV) subtypes 3 and 10.

1E82 Warts of lips or oral cavity

Infection of the lips and/or oral cavity, particularly the keratinized surfaces of the gingiva and palate, with "skin" type human papillomavirus (types 2 and 4). Focal epithelial hyperplasia (Heck disease) is a specific form of oral human papillomavirus infection caused by types 13 or 32 and of high prevalence in certain communities in the Americas.

1E82.0 Focal epithelial hyperplasia of oral mucous membranes

Otherwise known as Heck disease, this is due to infection of the oral mucosa by human papillomavirus types 13 or 32. It most commonly presents as multiple smooth mucosal papules, giving rise to a cobblestone appearance. It is particularly common in children from native communities of the Americas with incidence rates of up to 30% reported.

1E83 **Wart virus proliferation in immune-deficient states**

Enhanced proliferation of human papillomavirus as a result of a failure of immune surveillance. This may be due to a genetic defect, disease or iatrogenic immunosuppression.

1E8Z **Viral warts, not elsewhere classified**

Varicella zoster virus infections (1E90-1E91.Z)

1E90 **Varicella**

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

Coded Elsewhere: Fetal varicella syndrome (KA62.2)

Congenital varicella (KA62.2)

1E90.0 Varicella without complication

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

1E90.1 Varicella meningitis

A disease of the meninges, caused by an infection with varicella zoster virus. This infection is characterised by fever, stiff neck, headache, vomiting, photophobia, and sometimes an altered mental status or body aches. Transmission is through hematogenous spread to the meninges after inhalation of infected respiratory secretions, or direct contact with fluid from vesicles. Confirmation is by identification of varicella zoster viral DNA or anti-varicella zoster IgG in cerebrospinal fluid.

1E90.2 Varicella encephalitis

Inclusions: Postchickenpox encephalitis

Varicella encephalomyelitis

1E90.Y Varicella with other specified complication

1E91 **Zoster**

A disease caused by the reactivation of a latent infection with varicella zoster virus. This disease commonly presents with a rash (typically within one or two adjacent dermatomes), cutaneous hyperaesthesia, or fever.

1E91.0 Zoster without complications

A painful blistering skin eruption following a dermatomal distribution resulting from reactivation of Varicella zoster virus in dorsal nerve root ganglia.

1E91.1 Ophthalmic zoster

A disease of the eyes, caused by the reactivation of a latent infection with varicella zoster virus in the trigeminal nerve. This disease is characterised by a periorbital rash (typically within one dermatome), and conjunctivitis.

1E91.2 **Disseminated zoster**

Disseminated herpes zoster indicates the presence of widespread cutaneous involvement extending beyond the primarily affected and directly adjacent dermatomes. It may be associated with impaired immunity resulting from disease or from therapy.

1E91.3 **Zoster with central nervous system involvement**

1E91.4 **Acute neuropathy of cranial nerve due to zoster**

1E91.40 Acute trigeminal zoster neuropathy

1E91.41 Acute herpetic geniculate ganglionitis

1E91.4Y Other specified acute neuropathy of cranial nerve due to zoster

1E91.5 **Postherpetic polyneuropathy**

1E91.Y **Zoster with other specified complications**

1E91.Z **Zoster, unspecified**

1F00 Herpes simplex infections

Any condition caused by an infection with herpes simplex virus (human herpesviruses 1 and 2). Confirmation is by identification of herpes simplex virus type 1 or 2.

Exclusions: Herpangina (1F05.1)

Coded Elsewhere: Perinatal Herpes simplex infection (KA62.A)

Anogenital herpes simplex infection (1A94)

Sexually transmissible infections due to Herpes simplex virus (1A9Y)

1F00.0 **Herpes simplex infection of skin or mucous membrane**

A disease of the skin and mucous membranes, caused by an infection with herpes simplex virus type 1 or 2. This disease is characterised by vesicles, or may be asymptomatic. Transmission is by direct contact. Confirmation is by identification of herpes simplex virus type 1 or 2.

Coded Elsewhere: Anogenital herpes simplex infection (1A94)

1F00.00 Herpes simplex infection of skin

Herpes simplex infection affecting skin and commonly arising from person-to-person inoculation of virus from contact sports such as Rugby football or wrestling.

1F00.01 Herpes simplex labialis

Inclusions: Cold sore

1F00.02 Herpes simplex gingivostomatitis

1F00.03 Disseminated cutaneous herpes simplex infection complicating other skin diseases

1F00.0Y Other specified herpes simplex infection of skin or mucous membrane

1F00.1 **Herpes simplex infection of the eye**

A condition of the eye, caused by an infection with herpes simplex virus type 1 or 2. The condition is characterised by blepharoconjunctivitis or keratitis. Transmission is by direct contact. Confirmation is by identification of herpes simplex virus type 1 or 2.

Coded Elsewhere: Herpes simplex conjunctivitis (1D84.Y)

1F00.10 Herpes simplex keratitis

1F00.11 Herpes simplex infection of eyelid

1F00.1Y Other specified herpes simplex infection of the eye

1F00.1Z Herpes simplex infection of the eye, unspecified

1F00.2 **Herpes simplex infection of central nervous system**

A condition of the central nervous system, caused by an infection with herpes simplex virus (human herpesviruses 1 and 2). This condition is characterised by fever, headache, or other clinical symptoms depending on the site of infection. Confirmation is by identification of herpes simplex virus type 1 or 2.

Coded Elsewhere: Herpes simplex myelitis (1D02.1)

1F00.20 Herpes simplex meningitis

1F00.21 Encephalitis due to herpes simplex virus

Herpetic encephalitis is a cerebral infection caused by herpes simplex virus type 1 (HSV1). It presents as acute necrosing temporal encephalitis. Onset is rapid (less than 48 hours) with a fever of 40• C, headaches, and behavioural, language and memory problems. These initial manifestations are followed by numbness and coma, which may be accompanied by convulsions and paralysis. This disease, which affects only a small minority of HSV1-infected individuals, results from a primary immune deficiency.

Inclusions: Simian B disease

1F00.3 **Disseminated herpes simplex infection**

1F00.Y **Other specified herpes simplex infections**

1F00.Z **Herpes simplex infections, unspecified**

1F01 Roseola infantum

A disease caused by an infection with roseolovirus (human herpesvirus type 6 or 7). This disease is characterised by acute fever, followed by macular or maculopapular exanthem in some individuals. Transmission is by inhalation of infected respiratory secretions or direct contact.

1F02 Rubella

A disease caused by an infection with the rubella virus. This disease commonly presents with lymphadenopathy, or an exanthem that starts on the face and spreads to the limbs and trunk. Transmission is commonly by inhalation of infected respiratory secretions, or direct contact.

Coded Elsewhere: Congenital rubella syndrome (KA62.8)

1F02.0 Rubella with neurological complications

1F02.1 Rubella arthritis

A disease of the joints, caused by an infection with the rubella virus. This disease is characterised by inflammation of the joints leading to arthralgia or difficulties moving the joints. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by identification of rubella virus (in nasal or throat swab samples, blood, urine, or cerebrospinal fluid), or detection of rubella virus specific IgM antibodies.

1F02.2 Rubella without complication

Rubella was a common childhood viral infection until the advent of mass immunization programmes. It is characterised by a short-lived maculopapular exanthem, lymphadenopathy and mild fever: the majority of infections are not associated with significant morbidity. Transmission is by inhalation of infected respiratory secretions or by direct contact. Confirmation is by identification of rubella virus in nasal swab, throat swab or blood samples, or by detection of rubella virus specific IgM antibodies. Its public health importance lies in its potential to cause devastating harm to the fetus of an infected mother (congenital rubella syndrome).

1F02.Y Rubella with other specified complication

1F03 Measles

A disease of the respiratory system, caused by an infection with Morbillivirus. This disease is characterised by a blotchy rash, fever, cough, conjunctivitis, or malaise. This disease may also present with tiny white spots with bluish-white centres inside the mouth. Transmission is by inhalation of infected respiratory secretions, airborne transmission or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.

Inclusions: morbilli

Coded Elsewhere: Subacute sclerosing panencephalitis (8A45.01)

1F03.0 Measles without complication

A disease caused by an infection with Morbillivirus. This disease is characterised by fever, cough, coryza, conjunctivitis, enanthema, or maculopapular rash, without any additional secondary pathological conditions. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by detection of Morbillivirus RNA, or detection measles-specific IgM antibodies.

1F03.1 Measles complicated by encephalitis

A disease caused by an infection with Morbillivirus that is complicated by an infection of the brain. This disease is characterised by symptoms of measles as well as inflammation of the brain. This disease may also present with fever, headache, poor appetite, vomiting, confusion, lethargy, or photophobia. Transmission is by haematogenous spread to the brain after inhalation of infected respiratory secretions, by airborne transmission, or by direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.

1F03.2 **Measles complicated by meningitis**

A disease caused by an infection with Morbillivirus that is complicated by an infection of the meninges. This disease is characterised by symptoms of measles as well as inflammation of the meninges. This disease may also present with a fever, vomiting, lethargy, confusion, muscle pain, photophobia, or convulsions. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions, airborne transmission, or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.

Inclusions: Postmeasles meningitis

1F03.Y **Measles with other complications**

1F04 Erythema infectiosum

A condition caused by infection with parvovirus B19 (member of the Erythroparvovirus genus). In children, this condition is characterised by fever and cold-like symptoms initially, followed by a skin rash typically in the facial region In adolescents and adults, this condition may present with painful and swollen joints. Transmission is by droplet transmission, or vertical transmission.

Inclusions: Slapped cheek syndrome

1F05 Picornavirus infections presenting in the skin or mucous membranes

1F05.0 **Enteroviral vesicular stomatitis**

Enteroviral vesicular stomatitis, commonly called hand, foot and mouth disease, is a highly contagious enterovirus infection (usually Coxsackievirus A16 or Enterovirus 71). It typically causes a mild febrile illness with sore throat and loss of appetite followed by an eruption of vesicles on the lips, hands and feet. The majority of cases occur in children under the age of five.

Inclusions: Hand, foot and mouth disease

1F05.1 **Enteroviral vesicular pharyngitis**

1F05.2 **Enteroviral exanthematous fever**

An acute febrile, characteristically morbilliform exanthem due to infection by one of many different enteroviruses, especially Coxsackievirus and Echovirus.

Exclusions: Enteroviral vesicular pharyngitis (1F05.1)

Enteroviral vesicular stomatitis (1F05.0)

1F05.3 **Foot and mouth disease**

A rare infection in humans due to the Aphthovirus Foot-and-mouth-disease virus (FMDV), which is responsible for a highly contagious epidemic infection of cloven-hoofed animals, particularly cattle. It manifests in humans with prodromal fever and malaise followed by vesiculation and ulceration of oral mucous membranes and lips. Vesicles may sometimes involve the digits and palmoplantar skin.

Exclusions: Hand, foot and mouth disease (1F05.0)

1F05.Y **Other specified picornavirus infections presenting in the skin or mucous membranes**

1F0Y **Other specified viral infections characterised by skin or mucous membrane lesions**

1F0Z **Viral infections characterised by skin or mucous membrane lesions, unspecified**

Mycoses (1F20-1F2Z)

Exclusions: Mycosis fungoides (2B01)

Hypersensitivity pneumonitis due to organic dust (CA70)

Coded Elsewhere: Intestinal fungal infections

Fungal infection of fetus or newborn (KA63)

1F20 **Aspergillosis**

Aspergillosis (ABPA) is a disease caused by fungi of the genus Aspergillus and occurs in people with lung diseases or weakened immune system. ABPA is most common in people with asthma or cystic fibrosis. The organism is ubiquitous, being found in soil and water or in other decaying vegetation. It enters the body through the lungs. The Symptoms of ABPA include wheezing and coughing of blood.

Inclusions: aspergilloma

Coded Elsewhere: Aspergillus-induced allergic or hypersensitivity conditions (CA82.4)

Neonatal aspergillosis (KA63.1)

Myelitis associated with Aspergillus (1D02.2)

1F20.0 Invasive aspergillosis

A disease caused by an infection with the fungi Aspergillus. This disease is characterised by colonization and invasion of tissue by Aspergillus in one part of the body and may spread to other parts of the body. Transmission is commonly by inhalation of Aspergillus spores.

1F20.00 Invasive aspergillosis of the digestive tract

1F20.01 Invasive cerebral aspergillosis

1F20.02 Disseminated aspergillosis

Invasive aspergillosis affecting three or more organs.

1F20.0Y Invasive aspergillosis of other specified site

1F20.1 Non-invasive aspergillosis

1F20.10 Aspergillus otomycosis

Chronic superficial fungal infection of the external auditory canal and auricle due to saprophytic fungi of the genus Aspergillus.

1F20.11 Chronic aspergillosis of the paranasal sinuses

Inclusions: Chronic granulomatous Aspergillus rhinosinusitis

1F20.12 Chronic pulmonary aspergillosis

Nodular or cavitary lesion or lesions in the lung, of at least three months duration in a non-immunocompromised patient (or one whose immunocompromising condition has remitted or is trivial), caused by Aspergillus spp. as demonstrated on tissue section by staining, by positive culture of a percutaneous biopsy or positive Aspergillus IgG antibodies.

Inclusions: Pulmonary Aspergillus nodule

Simple pulmonary aspergilloma

Chronic cavitary pulmonary aspergillosis

CFPA - [chronic fibrosing pulmonary aspergillosis]

CNPA - [chronic necrotising pulmonary aspergillosis]

1F20.13 Tonsillar aspergillosis

1F20.14 Aspergillus bronchitis

1F20.15 Obstructing aspergillus tracheobronchitis

1F20.1Y Other specified non-invasive aspergillosis

1F20.Z **Aspergillosis, unspecified**

1F21 Basidiobolomycosis

Basidiobolomycosis is characterised by a slowly spreading, painless, non-pitting subcutaneous swelling without other obvious clinical signs. It may be single, or there may be multiple satellite lesions. The disc-shaped masses have a uniform hard consistency. It usually involves the limbs or limb-girdle areas and the infection is most often seen in children.

Inclusions: Subcutaneous mucoromycosis due to Basidiobolus ranarum

1F22 Blastomycosis

A disease caused by an infection with the fungi Blastomyces dermatitidis. This disease is characterised by fever, chills, cough, myalgia, arthralgia, or chest pain. This disease may also present in the skin and bones. Transmission is by inhalation of fungal spores. Confirmation is by identification of Blastomyces dermatitidis in a urine, cerebrospinal fluid, or blood sample.

Exclusions: Brazilian blastomycosis (1F2E)

keloidal blastomycosis (1F2B)

1F23 Candidosis

Candidosis is an infection caused by yeasts of the genus Candida. Superficial infections of the mucous membranes and skin are common, but deep invasive disease including fungal septicaemia, endocarditis and meningitis may also occur.

Inclusions: moniliasis

candidiasis

Coded Elsewhere: Neonatal candidosis (KA63.2)

Invasive neonatal candidosis (KA63.2)

1F23.0 **Candidosis of lips or oral mucous membranes**

A disease of the lips and oral mucous membranes, caused by an infection with the fungi Candida. This disease commonly presents with white patches or plaques on the oral mucous membranes, angular cheilitis, or dysphagia. Transmission is by opportunistic transmission. Confirmation is by identification of Candida in an oral or skin sample.

Exclusions: Neonatal candidosis (KA63.2)

1F23.1 **Candidosis of skin or mucous membranes**

Coded Elsewhere: Neonatal mucocutaneous candidosis (EH12)

1F23.10 Vulvovaginal candidosis

A disease caused by an infection with the fungi Candida. This disease is characterised by genital itching, burning, or vaginal discharge. Transmission is by endogenous spread, or sexual contact. Confirmation is commonly by identification of Candida in a vaginal swab.

1F23.11 Candida balanoposthitis

A disease caused by an infection with the fungi Candida (commonly Candida albicans). This disease is characterised by inflammation of the glans or prepuce. This disease may also present with eroded white papules, or white discharge. Transmission is by sexual contact. Confirmation is by identification of Candida in a sub-preputial swab or urine sample.

Inclusions: Candidosis of penis

Penile thrush

1F23.12 Flexural or intertriginous candidosis

Candidosis of flexural and intertriginous skin, where the warm, moist conditions favour the growth of Candida yeasts.

1F23.13 Candidosis of nail or paronychium

Infection of the nail and/or paronychium (nail fold) with Candida yeasts

1F23.14 Chronic mucocutaneous candidosis

Chronic Mucocutaneous Candidiasis is a primary immune deficiency characterised by persistent and/or recurrent infections of skin, nails and mucous membranes, caused by organisms of the genus Candida, mainly C. Albicans.

1F23.15 Disseminated cutaneous candidosis

1F23.16 Candida otomycosis

Infection of the external auditory canal with Candida yeasts, especially Candida parapsilosis. The infection may present with whitish greasy debris in, or discharge from the external auditory canal, or with erythema, oedema and pain. Candida otomycosis is less common than otomycosis due to Aspergillus. Chronic infection may be associated with perforation of the eardrum.

1F23.1Y Candidosis of skin or mucous membrane of other specified site

1F23.1Z Candidosis of skin or mucous membranes, unspecified

1F23.2 **Candidosis of gastrointestinal tract**

1F23.3 **Systemic or invasive candidosis**

Invasion of internal organs by Candida yeasts. Risk factors include acute leukemia, haematopoietic stem cell or solid organ transplantation, and acute critical illness. Candida species other than Candida albicans are commonly implicated.

Coded Elsewhere: Invasive neonatal candidosis (KA63.2)

Candidaemia (MA15.1)

1F23.30 Candida meningitis

1F23.31 Pulmonary candidosis

A disease of the pulmonary system, caused by an infection with the fungi Candida. This disease is characterised by fever, chills, cough, nausea, vomiting, tachypnoea, tachycardia, or dyspnoea. Transmission is by opportunistic transmission. Confirmation is by identification of Candida from a sputum sample.

1F23.3Y Other specified systemic or invasive candidosis

1F23.3Z Systemic or invasive candidosis, unspecified

1F23.Y **Other specified candidosis**

1F23.Z **Candidosis, unspecified**

1F24 Chromoblastomycosis

Chromoblastomycosis is a chronic fungal infection of the skin and subcutaneous tissues caused by a variety of pigmented fungi including Phialophora verrucosa, Fonsecaea pedrosoi, Fonsecaea compacta and Cladophialophora carrionii, which can be found in soil and wood. The infection usually follows trauma, such as a puncture from a splinter of wood and tends to affect exposed sites such as the feet and ankles. Chromoblastomycosis manifests initially as a warty papule which slowly enlarges to form a hypertrophic, warty plaque. Eventually, after months or many years, large hyperkeratotic masses may form, sometimes with secondary ulceration.

1F25 Coccidioidomycosis

A disease caused by an infection with the fungi Coccidioides. This disease presents with symptoms depending on the site of infection, or may be asymptomatic. Transmission is commonly by inhalation of fungal spores. Confirmation is by identification or culture of Coccidioides from affected tissue or samples, or detection of antibodies against coccidioides in serum or cerebrospinal fluid.

1F25.0 **Pulmonary coccidioidomycosis**

A disease of the pulmonary system, caused by an infection with the fungi Coccidioides. This disease is characterised by cough, myalgia, fatigue, chest pain, pneumonia, or pleural effusion. Transmission is commonly by inhalation of fungal spores. Confirmation is by direct examination or culture of Coccidioides in a sputum, bronchoalveolar lavage fluid, or tissue sample.

1F25.00 Acute pulmonary coccidioidomycosis

Forty per cent of coccidioidal infections result in symptomatic pulmonary disease that may be indistinguishable from a bacterial community-acquired pneumonia. Radiographically these are usually focal alveolar infiltrates. Infection may be associated with the development of a rash, particularly erythema nodosum and erythema multiforme. Occasionally, there may be symmetric arthralgias or arthritis. Peripheral blood eosinophilia is not uncommon. Acute primary pulmonary coccidioidomycosis, particularly when associated with erythema nodosum and/or erythema multiforme, is frequently called "Valley fever." When associated with arthralgias or arthritis, it has been termed "desert rheumatism."

1F25.01 Chronic pulmonary coccidioidomycosis

A chronic form of pulmonary coccidioimycosis. Pulmonary sequelae occur in approximately 5% of all cases of acute pulmonary coccidioidomycosis

1F25.1 **Extrathoracic coccidioidomycosis**

Coccidioidomycosis involving sites other than the lungs and thoracic cavity. Recognised sites include lymph nodes, bones, joints, central nervous system and skin. Transmission is through haematogenous spread to other body sites after inhalation of fungal spores or by direct inoculation.

Coded Elsewhere: Myelitis associated with Coccidioides infection (1D02.2)

1F25.10 Disseminated coccidioidomycosis

Diffuse pulmonary coccidioidomycosis occurs either when there is inhalation of a massive number of arthroconia, such as may occur during archeological excavations, or among individuals with severely depressed cellular immunity (e.g., late HIV-1 infection [AIDS]; cancer chemotherapy; allogeneic transplant recipients, treatment with corticosteroids; and during the second, third trimesters and postpartum pregnancy). The radiographic appearance often is a mixture of small nodules and interstitial findings, sometimes called "reticulonodular" or, because of it may resemble overwhelming pulmonary tuberculosis, "miliary."

1F25.11 Primary cutaneous coccidioidomycosis

Coccidioidomycosis may rarely result from direct inoculation, usually through a puncture of the skin by a thorn or other vegetative structure. The infection generally remains confined to this area with local lymphangitic spread and is not considered indicative of disseminated disease. Coccidioidal serology tests may be positive.

1F25.12 Coccidioides meningitis

An uncommon but often lethal form of coccidioidomycosis due to dissemination of Coccidioides fungi from the primary site of infection, principally the lungs, to the central nervous system.

Inclusions: Coccidioidomycosis meningitis

1F25.1Y Other specified extrathoracic coccidioidomycosis

1F25.Z **Coccidioidomycosis, unspecified**

1F26 **Conidiobolomycosis**

Conidobolomycosis is a subcutaneous infection involving nasal mucosa and paranasal sinuses, leading to formation of firm, subcutaneous nodules or polyps. The infection may be acquired via inhalation of spores or a minor trauma such as an insect bite. The infected host is frequently an otherwise healthy individual working outdoors in tropical areas. Conidiobolomycosis can, however, cause major facial disfigurement. In individuals with impaired immune responses more invasive and potentially fatal infections may occur: such infections are not usually associated with skin lesions.

Inclusions: Rhinoentomophthoromycosis

1F27 **Cryptococcosis**

A disease caused by an infection with the fungi Cryptococcus neoformans or Cryptococcus gattii. This disease commonly presents with shortness of breath, cough, fever, fatigue, or headache. Transmission is by inhalation of fungal spores. Confirmation is by identification of Cryptococcus neoformans or Cryptococcus gattii in a blood, sputum, or cerebrospinal fluid sample.

1F27.0 Pulmonary cryptococcosis

The pattern of cryptococcal pulmonary disease ranges from asymptomatic airway colonization to pneumonia to acute respiratory distress syndrome. If present, symptoms include cough, dyspnoea or chest pain. Common chest X-ray appearances include nodules or infiltrates. In the immunocompetent host, focal lesions are more commonly seen with infection due to C. gattii.

1F27.1 Cerebral cryptococcosis

A disease of the central nervous system, caused by an infection with the fungi Cryptococcus neoformans or Cryptococcus gattii. This disease is characterised by fever, headache, lethargy, or neurological deficits. Transmission is by inhalation of fungal spores. Confirmation is by identification of Cryptococcus neoformans or Cryptococcus gattii in a blood, sputum, or cerebrospinal fluid sample.

Coded Elsewhere: Meningitis due to Cryptococcus neoformans (1D01.10)

1F27.2 Disseminated cryptococcosis

Disseminated crytococcosis is most common in immunocompromised hosts, with involvement with any organ and predilection for the central nervous system. It may manifest as systemic illness with fever, night sweats and malaise. Blood cultures may be positive (cryptococcaemia).

1F27.Y Other specified cryptococcosis

1F27.Z Cryptococcosis, unspecified

1F28 Dermatophytosis

Dermatophytosis (tinea, ringworm) is a superficial infection of the skin, hair or nails by dermatophyte fungi of the genera Trichophyton, Epidermophyton or Microsporum. These fungi normally invade only the outer keratinous layer of the epidermis (stratum corneum), the hair shaft and the nail. They count amongst the commonest infections in man. Some species (e.g. Trichophyton rubrum) are essentially anthropophilic and infect only man whereas others are zoophilic (e.g. Trichophyton verrucosum) but may cause human infection from contact with infected animals.

Inclusions: Infections due to species of Epidermophyton, Microsporum and Trichophyton

Exclusions: Tinea nigra (1F2D.4)

Tinea versicolor (1F2D.0)

1F28.0 Dermatophytosis of scalp

Dermatophytosis (tinea) affecting scalp and scalp hair. Clinical features range from limited patchy alopecia and scaling to widespread inflammation and suppuration with occipital lymphadenopathy. The scalp is a typical site for a kerion (q.v.), often due to a zoophilic dermatophyte acquired from an infected animal.

Inclusions: Tinea capitis

Scalp ringworm

1F28.1 Dermatophytosis of nail

Fungal infection of the nail plate due to dermatophyte fungi (tinea unguium). Infection results in a range of clinical signs including white or yellow discolouration, detachment of the plate from the nail bed (onycholysis), keratinous thickening under the nail plate (subungual hyperkeratosis) and fragility and fragmentation of the abnormal nail plate.

Inclusions: Onychomycosis due to dermatophyte

Tinea unguium

Ringworm of nails

Exclusions: Onychomycosis due to non-dermatophyte mould (1F2D.5)

Candida onychomycosis (1F23.13)

1F28.2 Dermatophytosis of foot

Dermatophytosis of the skin of the foot (tinea pedis). The lateral interdigital toe clefts are the most common initial site of infection. Longstanding infection with Trichophyton rubrum, the most commonly implicated organism in Europe and North America, characteristically causes dry scaling over the sole of the foot. Other species which regularly invade the skin of the foot include Epidermophyton floccosum and Trichophyton interdigitale.

Inclusions: Moccasin foot

Tinea pedis

Athlete's foot

Ringworm of foot

1F28.3 Genitocrural dermatophytosis

Dermatophyte infection of the inguinocrural folds and adjacent external genitalia (tinea cruris). It presents as erythema and inflammation of affected skin with an advancing scaly edge. It is typically itchy and affects adult men much more commonly than women or children. Dermatophyte infection of the toe clefts commonly co-exists.

Inclusions: Tinea cruris

Ringworm of groin

Dermatophytosis of groin

1F28.4 Kerion

Kerion results from a severe host inflammatory response to dermatophyte infection of the hair follicles of the scalp or beard. It typically presents as a single painful, severely inflammatory, suppurating boggy mass and is most commonly a reaction to a zoophilic dermatophyte infection especially Trichophyton verrucosum (cattle ringworm) or Trichophyton mentagrophytes.

1F28.5 Disseminated dermatophytosis

Extensive and invasive dermatophyte infection due either to a specific genetic anergy to dermatophytes or to profound immunosuppression. Dermal nodules, abscesses or draining sinuses may occur; rarely bone, central nervous system and lymph nodes may be involved.

1F28.Y Other specified dermatophytosis

1F28.Z Dermatophytosis, unspecified

1F29 Eumycetoma

A localised chronic infection caused by various species of fungi and characterised by the formation of aggregates of the causative organisms (grains) within abscesses. This results in severe damage to skin, subcutaneous tissues and bones of the feet, hands and other parts of the body, with draining sinuses which discharge grains to the surface. Recognised agents include Madurella mycetomatis, Madurella grisea, Leptosphaeria senegalensis, Curvularia lunata, Scedosporium apiospermum, Neotestudina rosatii,

Acremonium spp. and Fusarium spp.

Inclusions: Mycetoma due to fungal infection

Exclusions: Actinomycetoma (1C43)

1F2A Histoplasmosis

Histoplasmosis is a disease caused by the fungus Histoplasma that exists worldwide with two significant variants: Histoplasma capsulatum and Histoplasma duboisii.

Coded Elsewhere: Meningitis due to Histoplasma capsulatum (1D01.1Y)

Histoplasmosis-related fibrosing mediastinitis (CB22.0)

1F2A.0 **Pulmonary histoplasmosis capsulati**

A disease of the pulmonary system, caused by an infection with the fungi Histoplasma capsulatum. This disease is characterised by fever, chest pains, or a dry, nonproductive cough. Transmission is by inhalation of fungal spores, commonly from contaminated soil, or bat or bird faeces. Confirmation is by identification of Histoplasma capsulatum from affected tissue or body fluids, detection of antibodies against Histoplasma capsulatum, or detection of Histoplasma capsulatum antigen.

1F2A.1 **Histoplasmosis due to Histoplasma duboisii**

This form of histoplasmosis is endemic to Sub-Saharan Africa and is generally less virulent than histoplasmosis due to H. capsulatum, the classical form which occurs predominantly in tropical and subtropical regions of the Americas but is also seen in Africa and Asia. Otherwise known as African histoplasmosis, histoplasmosis due to Histoplasma duboisii usually involves the skin and subcutaneous tissue, lymph nodes and bones and rarely the lungs and other internal organs.

1F2A.Y **Other specified histoplasmosis**

1F2A.Z **Histoplasmosis, unspecified**

1F2B Lobomycosis

A disease of the skin, caused by an infection with the fungi Lacazia loboi. This disease commonly presents with dermal nodules (either lenticular or in plaques), keloids, subcutaneous mycoses, or malignant tumours. Transmission is commonly by direct contact with contaminated water, soil, vegetation, or may be by direct contact with an infected dolphin. Confirmation is by identification of Lacazia loboi in a lesion exudate or tissue sample.

Inclusions: Lobo disease

1F2C Mucormycosis

A disease caused by an infection with the fungi from the order Mucorales. This disease presents with symptoms depending on the site of the infection. Transmission is by direct contact with infected soil or decaying matter. Confirmation is by identification of fungi from the order Mucorales from a tissue sample.

1F2D Non-dermatophyte superficial dermatomycoses

Any condition of the skin and mucous membranes, caused by an infection with fungi other than Candida and dermatophytes.

Exclusions: Candidosis (1F23)

Dermatophytosis (1F28)

1F2D.0 **Pityriasis versicolor**

A disease of the skin, caused by an infection with the fungi Malassezia. This disease is characterised by white, pink, fawn, brown, or often coalescing lesions that may be covered with thin furfuraceous scales. This disease commonly presents on the trunk, shoulders and arms, or neck and face. Transmission is by opportunistic transmission. Confirmation is by identification of Malassezia in a skin sample.

1F2D.1 **Malassezia folliculitis**

Malassezia folliculitis is caused by the invasion of the hair follicle by Malassezia yeasts. Although Malassezia yeasts are a part of the normal human microflora, under certain conditions they can cause superficial dermatological conditions. The invasion results in the development of erythematous papules, and sometimes pustules, which may be either asymptomatic or itchy. Usually Malassezia yeasts are present along with staphylococci and propionibacteria in the follicles.

Inclusions: Seborrhoeic folliculitis

Exclusions: Seborrhoea (ED91.2)

1F2D.2 **White piedra**

A disease of the hair shaft, caused by an infection with the fungi Trichosporon beigelii. This disease is characterised by irregular, soft, white, or light brown nodules which adhere to the hair follicle. Transmission is by direct contact with contaminated soil or water, or by airborne transmission. Confirmation is by identification of Trichosporon beigelii in a hair follicle sample.

Inclusions: Trichosporosis nodosa

1F2D.3 **Black piedra**

Inclusions: Trichomycosis nodularis

1F2D.4 **Tinea nigra**

A disease of the skin, caused by an infection with the fungi Tinea nigra. This disease is characterised by brown to black macules; small, flat circumscribed changes in the colour of skin. This disease commonly presents on the palmar surfaces, soles, or other skin surfaces. Transmission is by direct contact with contaminated soil, wood, or vegetation. Confirmation is identification of Tinea nigra in a skin sample.

Inclusions: Keratomycosis nigricans palmaris

1F2D.5 **Onychomycosis due to non-dermatophyte mould**

Fungal nail infection due to organisms other than Candida and dermatophytes. These include Scopulariopsis brevicaulis, Neoscytalidium dimidiatum, Fusarium spp., and Aspergillus spp., which may not respond to therapies directed at the more common causes of onychomycosis.

Exclusions: Candidosis of nail or paronychium (1F23.13)

1F2D.Y **Other specified non-dermatophyte superficial dermatomycoses**

1F2E Paracoccidioidomycosis

A disease caused by an infection with the fungi Paracoccidioides brasiliensis. This disease commonly presents with fever, toxaemia, weight loss, adenopathy, hepatosplenomegaly, anaemia, or eosinophilia. This disease may present with symptoms similar to tuberculosis, leukaemia, or lymphoma. Transmission is by inhalation of fungal spores. Confirmation is by identification of Paracoccidioides brasiliensis in a blood, sputum, or skin sample.

1F2E.0 **Pulmonary paracoccidioidomycosis**

A disease of the pulmonary system, caused by an infection with the fungi Paracoccidioides brasiliensis. This disease is characterised by fever, cough, dyspnoea, or malaise. Transmission is by inhalation of fungal spores. Confirmation is by identification of Paracoccidioides brasiliensis in a blood or sputum sample.

1F2E.1 **Disseminated paracoccidioidomycosis**

Disseminated paracoccidioidomycosis results from haematogenous and lymphatic dissemination of yeasts from the lungs and aerodigestive tract. Cutaneous involvement, seen in 25% of cases, presents as crusted papules, ulcers, nodules, and verrucous plaques. Lymphadenopathy occurs commonly in the cervical region, but all lymph node chains can be involved. Adrenal glands are commonly affected with a significant risk of adrenal insufficiency and Addisonian crisis. Long bones such as ribs, humeri, and clavicles can be involved. Mesenteric lymph node involvement can lead to bowel obstruction. Meningoencephalitis occurs in up to one quarter of cases.

1F2E.Y **Other specified paracoccidioidomycosis**

1F2E.Z **Paracoccidioidomycosis, unspecified**

1F2F Phaeohyphomycosis

1F2G Pneumocystosis

Coded Elsewhere: HIV disease resulting in Pneumocystis jirovecii pneumonia (1C62.2)

1F2G.0 **Pulmonary pneumocystosis**

An opportunistic pulmonary infection by the fungus Pneumocystis jirovecii. It is strongly associated with HIV and AIDS.

Coded Elsewhere: Pneumonia due to pneumocystis (CA40.20)

1F2G.Z **Pneumocystosis, unspecified**

1F2H Scedosporiosis

An opportunistic infection caused by fungal species of the genus Scedosporium. The most common clinical presentation is disseminated infection, which is associated with underlying disease, especially haematological malignancy, or with organ transplantation, especially of the lung. Infections of lung, bones or joints are also well recognised.

1F2J Sporotrichosis

A disease caused by an infection with the fungi Sporothrix schenckii. This disease presents with symptoms depending on the site of infection. Transmission is by direct contact with infected thorny plants, sphagnum moss, soil, bales of hays, or infected plant material. Confirmation is by identification of Sporothrix schenckii from a tissue or skin sample.

1F2J.0 Lymphocutaneous sporotrichosis

This is the most common type of sporotrichosis and follows implantation of Sporothrix schenckii spores into a cutaneous wound, most commonly on the upper extremity. In addition to a localised nodule or pustule, a chain of nodules develops along draining lymphatics. In longstanding cases regional lymph nodes may become involved.

1F2J.1 Fixed cutaneous sporotrichosis

Cutaneous sporotrichosis which remains localised to the area of inoculation.

1F2J.2 Pulmonary sporotrichosis

Pulmonary forms of infection, although uncommon, can occur when Sporothrix schenckii conidia are inhaled. [1]

Symptoms of pulmonary sporotrichosis mimic those of tuberculosis including constitutional complaints of fever, night sweats, weight loss, and fatigue as well as respiratory complaints including dyspnoea, cough, purulent sputum, and haemoptysis.[2]

1F2J.3 Disseminated sporotrichosis

1F2J.Y Other specified sporotrichosis

1F2J.Z Sporotrichosis, unspecified

1F2K Talaromycosis

Talaromycosis is an infection due to Talaromyces marneffei, an ubiquitous saprophyte of soil and decomposing organic matter. This dimorphic fungus, formerly known as Penicillium marneffei, is endemic to Southeast Asia and the southern part of China. Once considered rare, its occurrence has increased due to AIDS. It is now the third most common opportunistic infection in HIV-positive individuals. The most common symptoms are fever, skin lesions, anaemia, generalised lymphadenopathy, and hepatomegaly.

1F2L Emmonsiosis

An opportunistic infection caused by a variety of Emmonsia and Emmonsia-like fungal species. It was historically seen as a rare lung pathogen but is now increasingly reported as a disseminated infection in persons immunosuppressed, particularly as the result of HIV infection.

1F2L.0 Disseminated adiaspiromycosis

An increasingly reported fulminant fungal infection caused by Emmonsia and Emmonsia-like fungal species. It is seen in the context of profound immunosuppression, especially from HIV infection. This is in contrast with pulmonary adiaspiromycosis, which is also caused by Emmonsia species but typically affects immunocompetent individuals. Its clinical presentation is similar to those of histoplasmosis and blastomycosis. Skin and lung involvement is characteristic but the CNS and blood may also be affected.

Exclusions: Pulmonary adiaspiromycosis (1F2L.1)

1F2L.1 **Pulmonary adiaspiromycosis**

Pulmonary adiaspiromycosis is an infection of the lungs due to inhalation of spores of the saprophytic soil fungus Chrysosporium parvum(formerly Emmonsia parva). The fungus affects many species of rodents but may occasionally infect humans. It is characterised by the presence of huge spherules (adiaspores) in the lungs.

Inclusions: Adiaspiromycosis

1F2L.Y **Other specified emmonsiosis**

1F2L.Z **Emmonsiosis, unspecified**

1F2Y **Other specified mycoses**

1F2Z **Mycoses, unspecified**

Parasitic diseases (1F40-1G2Z)

Coded Elsewhere: Parasitic diseases in the fetus or newborn (KA64)

Malaria (1F40-1F4Z)

A disease caused by an infection with a protozoan parasite from the Plasmodium genus. This disease commonly presents with fever, chills, headache, nausea and vomiting, or malaise. Transmission is through the bite of an infected mosquito. Confirmation is commonly by identification of the Plasmodium genus in a blood sample.

Coding Note: In cases of mixed malaria code all relevant types separately.

Coded Elsewhere: HIV disease clinical stage 4 associated with malaria (1C61.3)

HIV disease clinical stage 3 associated with malaria (1C61.2)

HIV disease clinical stage 2 associated with malaria (1C61.1)

HIV disease clinical stage 1 associated with malaria (1C61.0)

Human immunodeficiency virus disease associated with malaria (1C61)

Malaria complicating pregnancy, childbirth, or the puerperium (JB63.60)

Other congenital malaria (KA64.Y)

1F40 **Malaria due to Plasmodium falciparum**

A disease caused by an infection with the protozoan parasite Plasmodium falciparum. This disease is characterised by fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. This disease may also present with splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary or renal dysfunction, or neurologic changes. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.

Coding Note: Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

Coded Elsewhere: Congenital falciparum malaria (KA64.1)

1F40.0 **Plasmodium falciparum malaria with cerebral complications**

A disease of the cerebrum, caused by an infection with the protozoan parasite Plasmodium falciparum. This disease commonly presents with retinal whitening, splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary dysfunction, renal dysfunction, or neurologic changes. This disease may also present with fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.

1F40.Y **Other severe and complicated Plasmodium falciparum malaria**

Coding Note: Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

1F40.Z **Malaria due to Plasmodium falciparum, unspecified**

Coding Note: Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

1F41 Malaria due to Plasmodium vivax

A disease caused by an infection with the protozoan parasite Plasmodium vivax. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium vivax in a blood sample.

Exclusions: when mixed with Plasmodium falciparum (1F40)

1F41.0 **Plasmodium vivax malaria with rupture of spleen**

1F41.Y **Malaria due to Plasmodium vivax with other complications**

1F41.Z **Plasmodium vivax malaria without complication**

1F42 Malaria due to Plasmodium malariae

A disease caused by an infection with the protozoan parasite Plasmodium malariae. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium malariae in a blood sample.

Exclusions: when mixed with Plasmodium vivax (1F41)

when mixed with Plasmodium falciparum (1F40)

1F42.0 **Plasmodium malariae malaria with nephropathy**

Quartan malarial nephropathy is a rare complication of malariae (quartan) malaria, especially occurring in children; it is a glomerulonephritis, usually fatal.

1F42.Y **Malaria due to Plasmodium malariae with other complications**

1F42.Z **Plasmodium malariae malaria without complication**

1F43 **Malaria due to Plasmodium ovale**

A disease caused by an infection with the protozoan parasite Plasmodium ovale. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium ovale in a blood sample.

Exclusions: when mixed with Plasmodium malariae (1F42)

when mixed with Plasmodium falciparum (1F40)

when mixed with Plasmodium vivax (1F41)

1F44 **Other parasitologically confirmed malaria**

1F45 **Malaria without parasitological confirmation**

Clinically diagnosed malaria without parasitological confirmation

Inclusions: Clinically diagnosed malaria without parasitological confirmation

1F4Z **Malaria, unspecified**

Coding Note: In cases of mixed malaria code all relevant types separately.

Nonintestinal protozoal diseases (1F50-1F5Z)

Infections with unicellular organisms of the subkingdom Protozoa.

Exclusions: Protozoal intestinal infections (1A30-1A3Z)

Coded Elsewhere: Amoebiasis (1A36)

Malaria without parasitological confirmation (1F45)

Protozoal diseases complicating pregnancy, childbirth or the puerperium (JB63.6)

1F50 **Acanthamoebiasis**

1F51 **African trypanosomiasis**

A disease caused by an infection with the protozoan parasite Trypanosoma brucei. This disease presents with symptoms depending on the form of the protozoan parasite (Trypanosoma brucei rhodesiense or Trypanosoma brucei gambiense). Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of Trypanosoma brucei in a blood or tissue sample.

1F51.0 Gambiense trypanosomiasis

A disease caused by an infection with the protozoan parasite Trypanosoma brucei gambiense. This disease is characterised by fever, headache, muscle and joint aches, or malaise. This disease may also present with lymphadenopathy, weight loss, or neurological deficits. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of Trypanosoma brucei gambiense in a biopsy of the lymph node.

Inclusions: West African sleeping sickness

Infection due to Trypanosoma brucei gambiense

1F51.00 Meningitis in Gambiense trypanosomiasis

1F51.0Y Other specified gambiense trypanosomiasis

1F51.0Z Gambiense trypanosomiasis, unspecified

1F51.1 Rhodesiense trypanosomiasis

A disease caused by an infection with the protozoan parasite Trypanosoma brucei rhodesiense. This disease is characterised by a chancre at the site of the bite. This disease may also present with fever, headache, muscle and joint aches, or lymphadenopathy. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of Trypanosoma brucei rhodesiense in a blood sample, lymph node fluid, or biopsy of the chancre.

Inclusions: East African sleeping sickness

Infection due to Trypanosoma brucei rhodesiense

1F51.10 Meningitis in Rhodesiense trypanosomiasis

1F51.1Y Other specified rhodesiense trypanosomiasis

1F51.1Z Rhodesiense trypanosomiasis, unspecified

1F51.Y Other specified african trypanosomiasis

1F51.Z African trypanosomiasis, unspecified

1F52 **Babesiosis**

A disease caused by the protozoan parasite Babesia. This disease is characterised by reproduction and lysis of erythrocytes leading to symptoms that depend on the level of parasitaemia and immune status of the infected individual. This disease may present with fever, chills, malaise, myalgia, haemolytic anaemia, shock, or may be asymptomatic. Transmission is through the bite of an infected tick (Ixodes), or vertical transmission. Confirmation is by identification of Babesia in a blood smear, or detection of antibodies against Babesia.

Inclusions: Piroplasmosis

1F53 **Chagas disease**

A disease caused by an infection with the protozoan parasite Trypanosoma cruzi. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease may also be asymptomatic. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.

Inclusions: American trypanosomiasis

infection due to Trypanosoma cruzi

1F53.1 **Acute Chagas disease without heart involvement**

A disease caused by an acute infection with the protozoan parasite Trypanosoma cruzi. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease presents with no cardiac involvement. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.

1F53.2 **Chronic Chagas disease with heart involvement**

A disease caused by a chronic infection with the protozoan parasite Trypanosoma cruzi. This disease commonly presents with severe malaise or cardiac involvement (such as cardiomyopathy, cardiac failure, thromboembolism, bradyarrhythmias, tachyarrhythmias, apical aneurysms, or cardiac arrest). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.

1F53.3 **Chagas disease with digestive system involvement**

A disease caused by an infection with the protozoan parasite Trypanosoma cruzi. This disease is characterised by severe malaise or digestive system involvement (such as megaoesophagus or megacolon). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.

1F53.4 **Meningitis in Chagas disease**

1F53.Y **Other specified Chagas disease**

1F53.Z **Chagas disease, unspecified**

1F54 Leishmaniasis

Leishmaniasis is due to infection by vector-borne protozoa from the genus Leishmania. These protozoa exist as obligate intracellular parasites in human and mammalian hosts and are transmitted form host to host by certain species of sandfly. Depending on the Leishmania species involved, the resultant disease picture may range from a localised cutaneous ulcer through extensive mucocutaneous destruction to severe systemic disease.

1F54.0 **Visceral leishmaniasis**

A disease caused by an infection with the protozoan parasite Leishmania. This disease is characterised by biphasic fever, hepatosplenomegaly, pancytopenia, wasting, darkening of the skin, or may be asymptomatic. Transmission is through the bite of an infected female phlebotomine sandfly. Confirmation is by identification of Leishmania from a tissue or blood sample, or detection of antibodies against Leishmania.

Inclusions: Kala-azar

1F54.1 Cutaneous leishmaniasis

Cutaneous leishmaniasis results from bites by sandflies infected by protozoan parasites of the genus Leishmania. Phlebotomus is the principal vector in the Old World (Mediterranean, North Africa, Ethiopia and Asia), where L. major, L. tropica, L. aethiopica and L. donovani infantum predominate. Other sandflies are responsible for transmitting the New World species, L. mexicana and L. brasiliensis. The commonest presentation is with one or more crusted nodules or ulcers on exposed sites which gradually heal with scarring. Mexican and Ethiopian forms have a tendency to cause diffuse infiltration of the skin; South American forms frequently progress to mucocutaneous leishmaniasis.

Coded Elsewhere: Post-kala-azar dermal leishmaniasis (1F54.0)

1F54.2 Mucocutaneous leishmaniasis

Mucocutaneous leishmaniasis is a secondary infection of nasal and oral mucosae, predominantly by Leishmania braziliensis. It usually first manifests within two years of initial cutaneous infection but often after the latter has healed. It results from lymphatic or haematogenous spread of infection and can cause severe local tissue destruction.

Inclusions: Leishmania braziliensis infection

1F54.Z Leishmaniasis, unspecified

1F55 Naegleriasis

Any condition caused by an infection with the protozoan parasite Naegleria.

Coded Elsewhere: Primary amoebic meningoencephalitis (1D00.2)

1F56 Rhinosporidiosis

Rhinosporidiosis is a chronic, usually painless localised infection of the mucous membranes. Formerly believed to be a fungus, the causative agent, Rhinosporidium seeberi, has also never been cultured. With 18S r DNA sequencing, this organism has been shown to be a protistan parasite. Rhinosporidiosis occurs worldwide, and the greatest numbers of cases are found in southern India and Sri Lanka.

1F57 Toxoplasmosis

A disease caused by an infection with the protozoan parasite Toxoplasma gondii. This disease is characterised by fever, lymphadenitis, sore throat, or rash. Transmission is by direct ingestion of contaminated food, indirectly by food or water contaminated with infected cat faeces, or vertical transmission. Confirmation is by detection of antibodies against Toxoplasma gondii, or identification of Toxoplasma gondii in tissue, cerebrospinal fluid, blood, or other body fluids.

Coded Elsewhere: Congenital toxoplasmosis (KA64.0)

1F57.0 Hepatitis due to Toxoplasma gondii

A disease of the liver, caused by an infection with the protozoan parasite Toxoplasma gondii. This disease is characterised by jaundice. Transmission is by haematogenous spread to the liver after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against Toxoplasma gondii in a blood sample or identification of Toxoplasma gondii in hepatic tissue.

1F57.1 Meningoencephalitis due to Toxoplasma gondii

A disease of the meninges and brain, caused by an infection with the protozoan parasite Toxoplasma gondii. This disease is characterised by seizures, neck pain, neurological deficits, or alterations in behaviour, cognition, or consciousness. Transmission is by haematogenous spread to the meninges and brain after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against Toxoplasma gondii in cerebrospinal fluid or identification of Toxoplasma gondii in cerebrospinal fluid, and advanced imaging of the nervous system.

Inclusions: Toxoplasma meningoencephalitis

1F57.2 Pulmonary toxoplasmosis due to Toxoplasma gondii

In immunodeficient patients, toxoplasmosis most often occurs in persons with defects in T cell–mediated immunity such as those receiving corticosteroids, anti–tumour necrosis factor (TNF) therapies, or cytotoxic drugs and those with hematologic malignancies, organ transplants, or acquired immunodeficiency syndrome (AIDS).

Pulmonary toxoplasmosis in the immunodeficient patient may appear in the form of interstitial pneumonitis, necrotizing pneumonitis, consolidation, pleural effusion, or empyema, or all of these.[1]

AIDS patients with Toxoplasma pneumonia present with cough, dyspnoea, and fever. As toxoplasmosis is generally seen only in advanced HIV infection with CD4 counts below 100, the majority of AIDS patients who develop toxoplasma pneumonia already have had previous HIV-associated opportunistic infections. In solid organ transplant patients, this is most commonly due to transplantation of a toxoplasma-seropositive lung or heart into a seronegative recipient, resulting in primary pulmonary disease. In bone marrow transplant patients, pulmonary toxoplasmosis occurs in 0.28% to 0.45% of patients. Unlike solid organ transplant patients, most of these patients have reactivation, not primary disease.[2]

Inclusions: Pulmonary toxoplasmosis

1F57.3 Eye disease due to Toxoplasma gondii

Chorioretinitis or ocular toxoplasmosis is a relatively common manifestation of T. gondii infection. Ocular toxoplasmosis occurs when cysts deposited in or near the retina become active, producing tachyzoites. Focal necrotizing retinitis is the characteristic lesion, but retinal scars from prior reactivation are typically present.

Inclusions: Toxoplasma oculopathy

1F57.Y Other specified toxoplasmosis

1F57.Z Toxoplasmosis, unspecified

1F58 **Microsporidiosis**

1F5Z **Unspecified protozoal disease**

Helminthiases (1F60-1F9Z)

Coded Elsewhere: Parasitic duodenitis (DA51.6Y)

Diseases due to nematodes (1F60-1F6Z)

1F60 **Angiostrongyliasis**

A disease caused by an infection with the parasitic worm Angiostrongylus. This disease commonly presents with fever, headache, stiffness of the neck and back, tingling or painful feelings in the skin, nausea and vomiting, or may be asymptomatic. Transmission is by ingestion of larvae in contaminated food.

1F60.0 Eosinophilic meningitis due to Angiostrongylus cantonensis

A disease of the meninges caused by an infection with Angiostrongylus cantonensis. This disease is characterised by fever, headache, stiffness of the neck, nausea, vomiting, muscular weakness, or paraesthesia. This disease may also present with abscesses, cerebral oedema, haemorrhage, diplopia, ataxia, or blindness. Transmission is by ingestion of infected undercooked snails, slugs, or transport hosts (such as frogs, fresh water shrimp, or land crabs). Confirmation is by identification of Angiostrongylus cantonensis from a cerebrospinal fluid sample, blood sample, or from a food history.

1F60.1 Intestinal angiostrongyliasis

A disease of the intestines caused by an infection with the parasitic worm Angiostrongylus costaricensis. This disease is characterised by abdominal pain, fever, nausea, or vomiting. This disease may also present with intestinal obstruction or perforation. Transmission is by ingestion of infected undercooked slugs, or food contaminated by infected slugs or their slime. Confirmation is by identification of Angiostrongylus costaricensis from a cerebrospinal fluid sample, blood sample or from a food history.

1F60.Y Other specified angiostrongyliasis

1F60.Z Angiostrongyliasis, unspecified

1F61 **Anisakiasis**

A disease caused by an infection with the parasitic worm Anisakis. This disease presents with severe abdominal pain, nausea, vomiting, or a hypersensitivity reaction. Transmission is by ingestion of undercooked contaminated fish or squid. Confirmation is by a history of consumption of undercooked fish or squid, or identification of Anisakis in the intestines or in a vomit sample.

Inclusions: Infection due to Anisakis larvae

1F62 **Ascariasis**

A disease caused by an infection with the parasitic worm Ascaris lumbricoides. This disease presents with symptoms depending on the extent of the infection, ranging from asymptomatic to intestinal blockage. Transmission is by the faecal-oral route from the ingestion of Ascaris eggs in contaminated food or water. Confirmation is by identification of Ascaris eggs in a faecal sample.

1F63 **Capillariasis**

Coded Elsewhere: Capillariasis due to Capillaria hepatica (DB90.0)

1F63.0 Capillariasis of the intestine

A condition caused by an infection with the parasitic worm Capillaria philippinensis. This condition is characterised by abdominal pain, diarrhoea, nausea, vomiting, or weight loss. Transmission is by ingestion of infected undercooked fish, or autoinfection. Confirmation is by identification of Capillaria phillippinensis in a tissue biopsy of the small intestines or faecal sample.

Exclusions: Capillariasis due to Capillaria hepatica (DB90.0)

1F63.Y Other specified capillariasis

1F63.Z Capillariasis, unspecified

1F64 **Dracunculiasis**

A disease resulting from drinking water contaminated with water fleas infected with larvae of the nematode Dracunculus medinensis. It may take up to a year from ingestion of larvae for a mature gravid female worm to migrate to the skin and discharge immature larvae on contact with water. Dracunculiasis typically manifests as an intensely pruritic papule on a lower extremity from which part of the worm may emerge. Secondary pyogenic infection is common. This may be preceded by generalised symptoms such as fever, pruritus, urticaria and oedema.

Inclusions: Guinea worm infestation

1F65 **Enterobiasis**

A disease of the intestine, caused by an infection with the parasitic worm Enterobius. This disease is characterised by inflammation of the anus, pruritus, rectal pain, or may be asymptomatic. Transmission is by the faecal-oral route or airborne transmission of the eggs from the parasitic worm. Confirmation is by identification of Enterobius eggs around the perianal region.

Inclusions: Pinworm infection

Threadworm infection

Oxyuriasis

1F66 **Filariasis**

infections with nematodes of the superfamily Filarioidea; presence of living worms in the body is mainly asymptomatic but the death of adult worms leads to granulomatous inflammation and permanent fibrosis; organisms of the genus Elaeophora infect wild elk and domestic sheep causing ischaemic necrosis of the brain, blindness, and dermatosis of the face.

Exclusions: Onchocerciasis (1F6A)

1F66.0 **Loiasis**

A disease caused by an infection with the parasitic worm Loa loa. This disease is characterised by Calabar swellings found anywhere on the body (commonly found near joints). This disease may also present with generalised itching, muscle pain, joint pain, fatigue or may be asymptomatic. Transmission is through the bite of an infected fly (genus Chrysops). Confirmation is by identification of adult Loa loa in the skin or eye, Loa loa microfilariae in a blood sample obtained in the day (1000 - 1400), or detection of antibodies against Loa loa in a blood sample.

Inclusions: Eye worm disease of Africa

Loa loa infestation

Calabar swelling

1F66.1 **Mansonelliasis**

A disease caused by an infection with the parasitic worm Mansonella. This disease is characterised by pruritus, dermal pigmentary changes, fever, or lymphadenopathy, or may be asymptomatic. Transmission is through the bite of an infected midge (genus Culicoides) or blackfly (genus Simulium). Confirmation is by identification of Mansonella microfilariae in a skin or blood sample.

1F66.2 **Filariasis due to Brugia species**

Coded Elsewhere: Filariasis due to Brugia timori (1F66.32)

Filariasis due to Brugia malayi (1F66.31)

1F66.3 **Lymphatic filariasis**

Infestation by filarial nematodes of the genera Wuchereria and Brugii. It is acquired via transcutaneous injection of larvae by mosquitoes previously infested with microfilariae from the blood of a human host. The adult worms live in the lymphatics but release microfilariae into the bloodstream to complete the life cycle of the parasite. Clinical disease occurs in only a minority of those infected. In the acute stage this may present as an acute painful adenolymphangitis with fever. Chronic infestation causes progressive obstruction of lymphatic vessels and can result in disfiguring lymphoedema (elephantiasis), particularly of the genitalia and lower extremities.

Exclusions: Lymphoedema due to lymphatic filariasis (BD93.13)

1F66.30 Filariasis due to Wuchereria bancrofti

This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae".

Inclusions: Bancroftian filariasis

1F66.31 Filariasis due to Brugia malayi

This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae". This diagnosis is due to a nematode (roundworm), one of the three causative agents of lymphatic filariasis in humans.

1F66.32 Filariasis due to Brugia timori

This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae". This diagnosis is due to a human filarial parasitic nematode (roundworm) which causes the disease "Timor filariasis."

1F66.3Z Lymphatic filariasis, unspecified

1F66.4 Subcutaneous dirofilariasis

Subcutaneous dirofilariasis normally results from the transmission of microfilariae of Dirofilaria repens from the latter's natural animal host to man via a mosquito bite. The adult worm cannot develop fully in man but typically manifests as a subcutaneous nodule, commonly located on or around the eyelids.

1F66.Y Other specified filariasis

1F66.Z Filariasis, unspecified

1F67 Gnathostomiasis

A disease caused by an infection with the parasitic worm Gnathostoma. This disease is characterised by painful, itchy swelling under the skin from movement of the parasite under the skin. This disease may also initially present with fever, lethargy, abdominal pain, vomiting, or diarrhoea, and may infect other parts of the body (lungs, bladder, eyes, ears, nervous system). Transmission is commonly by ingestion of undercooked contaminated freshwater fish, eels, frogs, birds, or reptiles, or ingestion of contaminated water. Confirmation is commonly by detection of antibodies against Gnathostoma, identification of migratory skin lesions, eosinophilia, and history of potential exposure.

Inclusions: Wandering swelling

1F68 Hookworm diseases

A disease caused by an infection with the parasitic worm Ancylostoma. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of Ancylostoma in a faecal sample.

Inclusions: Hook-worm infestation by Ancylostoma

Coded Elsewhere: Eosinophilic enteritis due to Ancylostoma (1F9Z)

1F68.0 **Ancylostomiasis**

A disease caused by an infection with the parasitic hookworm Ancylostoma duodenale. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of Ancylostoma duodenale in a faecal sample.

1F68.1 **Necatoriasis**

A disease caused by an infection with the parasitic worm Necator americanus. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of Necator americanus in a faecal sample.

Inclusions: Infection due to Necator americanus

1F68.2 **Cutaneous larva migrans**

A disease caused by an infection with the parasitic worm larvae, commonly Ancylostoma braziliense, A. caninum, or Uncinaria stenocephala. This disease is characterised by intense pruritus and erythematous, serpiginous lesions due to migration of parasitic larvae in the upper dermis where the larvae penetrate the skin. Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae).

1F69 Oesophagostomiasis

This refers to an inflammation of small intestine caused by infection due to a nematode called Oesophagostomum bifurcum.

1F6A Onchocerciasis

Any condition caused by an infection with the parasitic worm Onchocerca volvulus. These conditions are characterised by the presence of firm subcutaneous nodules filled with adult worms, pruritus, long-term corneal inflammation (keratitis), or thickening of the corneal stroma. If untreated, these infections will lead to blindness. Transmission is through the bite of an infected Simulium fly.

1F6A.0 **Onchocerciasis of the eye**

A disease of the eye, caused by an infection with the parasitic worm Onchocerca volvulus. This disease is characterised by transient punctate keratitis, or potentially blinding conditions (such as sclerosing keratitis, iridocyclitis, or optic atrophy). Transmission is through the bite of an infected Simulium fly. Confirmation is by identification of Onchocerca volvulus from the anterior chamber of the eye.

Inclusions: Ocular onchocerciasis

1F6A.1 **Onchocerciasis of the skin**

A disease of the skin, caused by an infection with the parasitic worm Onchocerca volvulus. This disease is characterised by subcutaneous nodules on the skin (commonly affecting the iliac crests, ribs, knees, or trochanters). Transmission is through the bite of an infected Simulium fly. Confirmation is by identification of Onchocerca volvulus in a skin sample.

Inclusions: Cutaneous onchocerciasis

1F6A.Y **Other specified onchocerciasis**

1F6B **Strongyloidiasis**

A disease caused by the parasitic worm Strongyloides. This disease presents with symptoms depending on the site of infection (gastrointestinal tract, pulmonary system, dermis, or systemic), or may be asymptomatic. Transmission is by direct contact through penetration of the skin (generally the feet) with larvae from faecally contaminated soil, or autoinfection of an established infection. Confirmation is by identification of Strongyloides larvae in faecal samples, duodenal fluid samples, sputum, pleural fluid, or tissue samples.

Exclusions: Trichostrongyliasis (1F6F)

1F6C **Syngamosis**

A disease caused by an infection with the parasitic worm Mammomonogamus. This disease is characterised by chronic nonproductive cough, crawling sensation in the throat, wheezing, or difficulties breathing. Transmission may be by ingestion of adult worms or eggs in contaminated food or water. Confirmation is by identification of adult Mammomonogamus by direct visualization, or identification of Mammomonogamus eggs in sputum or faecal samples.

1F6D **Toxocariasis**

A condition caused by an infection with the parasitic worm Toxocara. In ocular infections, this condition is characterised by vision loss or inflammation of the eye; in visceral infections, this condition is characterised by fever, coughing, enlarged liver, or pneumonia. This condition may also be asymptomatic. Transmission is by the faecal-oral route through the ingestion of food, water, or soil that contains Toxocara eggs (contaminated by faeces from an infected dog or cat). Confirmation is by detection of antibodies against Toxocara in a blood sample.

Inclusions: Toxocara infestation

1F6E **Trichinosis**

A disease caused by an infection with the parasitic worm Trichinella. This disease is characterised by fever, nausea, diarrhoea, vomiting, fatigue, or abdominal discomfort. This disease may also present with headache, chills, cough, swelling of the face and eyes, or aching joints and muscle pains. Transmission is by ingestion of contaminated meat. Confirmation is by detection of antibodies against Trichinella in a blood sample.

1F6F **Trichostrongyliasis**

A disease caused by an infection with the parasitic worm Trichostrongylus. This disease is characterised by abdominal pain, diarrhoea, weight loss, or may be asymptomatic. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of Trichostrongylus eggs in a faecal sample.

1F6G **Trichuriasis**

A disease of the small intestine, caused by an infection with the parasitic worm Trichuris trichiura. This disease is commonly asymptomatic. This disease may also present with painful diarrhoea (containing a mixture of mucus, water, or blood). Transmission is by the faecal-oral route. Confirmation is by identification of Trichuris trichiura eggs in a faecal sample.

Inclusions: Trichocephaliasis

1F6H **Uncinariosis**

A disease caused by an infection with the parasitic worm Uncinaria stenocephala. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of Uncinaria stenocephala in a faecal sample.

1F6Y **Other specified diseases due to nematodes**

1F6Z **Diseases due to nematodes, unspecified**

Diseases due to cestodes (1F70-1F7Z)

1F70 **Cysticercosis**

A disease caused by an infection of tissue with larval cysts from the parasitic worm Taenia solium. This disease presents with symptoms depending on the site of infection (central nervous system, eye, or muscle). Transmission is through haematogenous spread of larvae to affected tissue after ingestion of Taenia solium eggs (or proglottids) in contaminated food or water. Confirmation is commonly by detection of antibodies against Taenia solium in a blood sample, cerebrospinal fluid, or faeces, and by advanced imaging of affected tissue.

Inclusions: cysticerciasis infection due to larval form of Taenia solium

1F70.0 **Cysticercosis of central nervous system**

A disease of the central nervous system, caused by an infection of tissue with larval cysts from the parasitic worm Taenia solium. This disease presents with symptoms depending on the site of infection, the number and size of cysts, and the individual's immune status. This disease may present with epilepsy, chronic headache, hydrocephalus, neurological deficits, or may be asymptomatic. Transmission is by haematogenous spread of larvae to the central nervous system after ingestion of Taenia solium eggs in contaminated food or water. Confirmation is by detection of antibodies against Taenia solium in a blood sample, or cerebrospinal fluid and advanced imaging of the brain.

Coded Elsewhere: Encephalitis due to cysticercosis (1D00.2)

1F70.00 Meningitis due to Cysticercosis

A disease of the meninges, caused by an infection with larval cysts from the parasitic worm Taenia solium. This disease is characterised by headache, fever, seizures, or neurological deficits. Transmission is through hematogenous spread of larvae to the meninges after ingestion of Taenia solium eggs (or proglottids) in contaminated food or water. Confirmation is by advanced imaging and detection of antibodies against Taenia solium from serum or cerebrospinal fluid.

1F70.1 **Cysticercosis of eye**

A disease of the eye, caused by an infection of tissue with larval cysts from the parasitic worm Taenia solium. This disease is characterised by cysts floating in the vitreous humour of the eye leading to impaired vision. Transmission is by haematogenous spread of larvae to the eye after ingestion of Taenia solium eggs in contaminated food or water. Confirmation is commonly by history of travel in parasite endemic regions and advanced imaging of the eye.

1F70.Y **Other specified cysticercosis**

1F70.Z **Cysticercosis, unspecified**

1F71 Diphyllobothriasis

A disease caused by an infection with the parasitic worm Diphyllobothrium. This disease is characterised by abdominal discomfort, diarrhoea, vomiting, or weight loss. This disease may be asymptomatic. Transmission is by ingestion of infected undercooked fish. Confirmation is by identification of Diphyllobothriasis eggs in a faecal sample.

Exclusions: larval diphyllobothriasis (1F75)

1F72 Dipylidiasis

A condition caused by an infection with the parasitic worm Dipylidium caninum. This condition commonly present with abdominal pain, diarrhoea, anal pruritus, or may be asymptomatic. Transmission is by ingestion of an infected flea. Confirmation is by identification of Dipylidium caninum eggs in a faecal sample.

1F73 Echinococcosis

Inclusions: Hydatidosis

1F73.0 **Echinococcus infection of liver**

1F73.1 **Echinococcus infection of lung**

1F73.2 **Echinococcus infection of bone**

1F73.3 **Echinococcus infection of central nervous system**

Coded Elsewhere: Encephalitis due to echinococcosis (1D00.2)

1F73.Y **Other specified echinococcosis**

1F73.Z **Echinococcosis, unspecified**

1F74 **Hymenolepiasis**

A disease caused by an infection with the parasitic worm Hymenolepis. This disease is commonly asymptomatic. This disease may present with nausea, weakness, abdominal pain, diarrhoea, or vomiting. Transmission is by the ingestion of eggs commonly in contaminated food or water, or ingestion of infected arthropods. Confirmation is by identification of Hymenolepis eggs in a faecal sample.

1F75 **Sparganosis**

A disease caused by an infection with the parasitic worm Spirometra. This disease presents with symptoms depending on the site of the infection. Transmission is by ingestion of contaminated water or ingestion of infected undercooked second intermediate hosts (such as fish, reptiles or amphibians). Confirmation is by identification of Spirometra eggs in a faecal sample.

Inclusions: Larval diphyllobothriasis

Spirometrosis

1F76 **Taeniasis**

A disease of the intestines, caused by an infection with the adult parasitic worm Taenia. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef or pork. Confirmation is by identification of Taenia eggs or proglottids in faecal samples (samples from multiple days).

Exclusions: Cysticercosis (1F70)

1F76.0 **Taeniasis due to Taenia solium**

A disease of the intestines, caused by an infection with the adult parasitic worm Taenia solium. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked pork. Confirmation is by identification of Taenia solium eggs or proglottidis in faecal samples (samples from multiple days).

Inclusions: Taenia solium taeniasis

1F76.1 **Taeniasis due to Taenia saginata**

A disease of the intestines, caused by an infection with the adult parasitic worm Taenia saginata. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef. Confirmation is by identification of Taenia saginata eggs or proglottids in faecal samples (samples from multiple days).

Inclusions: Infection due to adult tapeworm Taenia saginata

Taenia saginata taeniasis

1F76.Y **Other specified taeniasis**

1F76.Z **Taeniasis, unspecified**

1F7Y **Other specified diseases due to cestodes**

1F7Z **Diseases due to cestodes, unspecified**

Diseases due to trematodes (1F80-1F8Z)

1F80 **Clonorchiasis**

A condition caused by an infection with the parasitic worm Clonorchis sinensis. This condition commonly presents with inflammation and obstruction of the biliary ducts. This condition may also present with abdominal pain, nausea, or diarrhoea. Transmission is commonly by ingestion of undercooked fish infected with parasitic cysts. Confirmation is by identification of Clonorchis sinensis eggs in a faecal sample.

Inclusions: Chinese liver fluke disease

Oriental liver fluke disease

Infection due to Clonorchis sinensis

1F81 **Dicrocoeliasis**

A disease caused by an infection with the parasitic worm Dicrocoelium dendriticum. This disease is commonly asymptomatic. This disease may present with cholecystitis, liver abscesses, or upper abdominal pain. Transmission is by ingestion of infected ants. Confirmation is by identification of Dicrocoelium dendriticum eggs in a faecal sample or duodenal fluid.

Inclusions: Lancet fluke infection

1F82 **Fascioliasis**

A disease of the hepatic system, caused by an infection with the parasitic worm Fasciola. In the acute phase, this disease is characterised by upper abdominal pain, fever, urticaria, shortness of breath, nausea, or vomiting due to migration of the parasite from the intestines to the liver. In the chronic phase, this disease is characterised by cholestasis, cholangitis, pancreatitis, or gallstones. This disease may be asymptomatic. Transmission is by ingestion of undercooked contaminated aquatic plants or contaminated water. Confirmation is commonly by identification of Fasciola eggs in a faecal sample (after the individual has followed a liver-free diet prior to testing), or detection of antibodies against Fasciola.

Inclusions: Sheep liver fluke disease

1F83 **Fasciolopsiasis**

A disease caused by an infection with the parasitic worm Fasciolopsis buski. This disease is characterised by abdominal pain or diarrhoea, or may be asymptomatic. This disease may also present with oedema of the face, abdomen, or legs, vomiting, anorexia, or intestinal obstruction. Transmission is by ingestion of undercooked contaminated aquatic plants. Confirmation is by identification of Fasciolopsis buski eggs in a faecal sample.

1F84 **Opisthorchiasis**

A disease caused by an infection with the parasitic worm Opisthorchis. This disease is commonly asymptomatic. In mild cases, this disease may present with dyspepsia, abdominal pain, diarrhoea, or constipation; in severe cases, this disease may present with hepatomegaly and malnutrition; in rare cases, this disease may present with cholangitis, cholecystitis, and cholangiocarcinoma. Transmission is by ingestion of infected undercooked freshwater fish. Confirmation is by identification Opisthorchis in a faecal sample.

1F85 **Paragonimiasis**

A disease caused by an infection with the parasitic worm Paragonimus. This disease is characterised by cough or haemoptysis, or may be asymptomatic. This disease may present with other symptoms depending on the site where the parasite migrates to. Transmission is commonly by ingestion of undercooked contaminated crustaceans (crab or crayfish). Confirmation is commonly by identification of Paragonimus eggs in a sputum or faecal sample.

Inclusions: lung fluke disease

infection due to paragonimus species

Infestation due to Paragonimus species

1F86 **Schistosomiasis**

An infestation caused by helminths of the genus Schistosoma. The clinical features vary according to the species involved but the principal organs affected are the gastrointestinal tract and bladder.

Inclusions: snail fever

1F86.0 Schistosomiasis due to Schistosoma haematobium

A disease caused by an infection with the parasitic worm Schistosoma haematobium. This disease is characterised by haematuria, scarring, calcification, or squamous cell carcinoma. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with Schistosoma haematobium eggs or snails that carry Schistosoma haematobium.

1F86.1 Schistosomiasis due to Schistosoma mansoni

A disease caused by an infection with the parasitic worm Schistosoma mansoni. This disease commonly presents with Katayama fever, hepatic perisinusoidal egg granulomas, Symmers' pipe stem periportal fibrosis, or portal hypertension. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with Schistosoma mansoni eggs or snails that carry Schistosoma mansoni. Confirmation is by identification of the Schistosoma mansoni eggs in a faecal sample.

1F86.2 Schistosomiasis due to Schistosoma japonicum

A disease caused by an infection with the parasitic worm Schistosoma japonicum. This disease is characterised by Katayama fever, hepatic perisinusoidal egg granulomas, Symmers' pipe stem periportal fibrosis, or portal hypertension. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with Schistosoma japonicum eggs or snails that carry Schistosoma japonicum. Confirmation is by identification of the Schistosoma japonicum eggs in a faecal sample.

Inclusions: Asiatic schistosomiasis

1F86.3 Other schistosomiases

1F86.4 Cercarial dermatitis

A disease caused by an infection with the parasitic worm Schistosoma. This disease is characterised by tingling, burning, itching of the skin, small reddish pimples, or small blisters. Transmission is by direct contact with contaminated water. Confirmation is by identification of Schistosoma eggs in a faecal, urine, or blood sample.

1F86.5 Schistosomal pneumonitis

1F86.Z Schistosomiasis due to unspecified or unknown Schistosoma species

1F8Y Other specified diseases due to trematodes

1F8Z Diseases due to trematodes, unspecified

1F90 Other and unspecified infestation by parasitic worms

1F90.0 Mixed intestinal helminthiases

1F90.1 Intestinal parasitic infestation not otherwise specified

This concept should be used for parasitic infestation of the intestine only when no more precise details are available.

1F90.2 **Intestinal helminthiasis, unspecified**

1F90.Y **Other specified other and unspecified infestation by parasitic worms**

1F90.Z **Other and unspecified infestation by parasitic worms, unspecified**

1F91 Diphyllobothriasis and sparganosis

Diphyllobothriasis is defined as infection with the cestode Diphyllobothrium latum or other Diphyllobothrium species, which occurs accidentally in humans who ingest water containing infected cyclops, eating raw or inadequately cooked flesh. Manifestations may include abdominal discomfort, diarrhoea, vomiting and megaloblastic anaemia. Massive infections may result in intestinal obstruction.

1F9Z Helminthiases, unspecified

Infestations by ectoparasites (1G00-1G0Z)

Diseases caused by parasitic organisms which normally live on the surface of the host.

Coded Elsewhere: Epidemic louse-borne typhus fever due to Rickettsia prowazekii (1C30.0)

Recrudescent typhus (1C30.1)

1G00 Pediculosis

A condition of the skin, hair, or genital region caused by an infection with the parasite Pediculus. This disease is characterised by pruritus. This condition also presents with symptoms depending on the site of infection. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of Pediculus.

1G00.0 **Pediculosis capitis**

A condition of the scalp and hair shaft, caused by an infection with the parasite Pediculus humanus capitis. This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of Pediculus humanus capitis eggs or Pediculus humanus capitis.

1G00.1 **Pediculosis corporis**

A condition of the skin, caused by an infection with the parasite Pediculus humanus corporis. This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of Pediculus humanus corporis eggs or Pediculus humanus corporis.

1G00.Z **Pediculosis of unspecified site or type**

1G01 **Myiasis**

A disease of the tissues, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera from a tissue sample.

Inclusions: infestation by larvae of flies

1G01.0 Ocular myiasis

A disease of the eye, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera.

1G01.1 Nasopharyngeal myiasis

1G01.2 Laryngeal myiasis

1G01.3 Cutaneous myiasis

The infestation of the skin or subcutaneous tissues by the larvae of certain flies (Phormia regina, Cordylobia anthropophaga, Cochliomyia hominivorax, C. macellaria, Wohlfahrtia vigil, W. meigeni, W. opaca, Dermatobia hominis, Sarcophaga krameri). characterised by a painful boil-like lesion containing one or more larvae with severe pruritus and local destruction of tissue.

1G01.Y Other specified myiasis

1G01.Z Myiasis, unspecified

1G02 **External hirudiniasis**

Infestation of the skin by leeches. Sensitisation to antigenic substances deposited in the skin can result in urticarial weals and bullae.

Exclusions: Internal hirudiniasis (1F60-1F9Z)

1G03 **Pthiriasis**

Infestation most commonly of pubic hair and less commonly of body hair or eyelashes by the crab louse, Pthirus pubis. Transmission is by direct, typically sexual contact with an infected individual. Confirmation is by identification of Pthirus pubis or its eggs.

Inclusions: Infestation by crab lice

1G04 Scabies

A highly contagious infestation of the skin by the mite Sarcoptes scabiei var. hominis. It may result in epidemics when introduced into institutions such as schools and nursing homes. The mites burrow into the skin, favouring the extremities, genitalia and, in infants, the axillae. The characteristic widespread intensely pruritic papulovesicular rash results largely from the host response rather than directly to burrowing by mites. Where such a response is absent as in immunosuppressed or debilitated patients, unchecked proliferation of mites results in crusted scabies. Sarcoptic mites from other mammals such as dogs may cause a transient pruritic eruption.

1G04.0 Classical scabies

1G04.1 Crusted scabies

Crusted scabies results from unchecked proliferation of the human scabies mite in individuals who are unable to mount an adequate immune response to infestation. Extensive thick crusts containing vast numbers of mites form over the skin, particularly of the extremities. Because itching is usually absent, the diagnosis is frequently overlooked. Patients with crusted scabies may serve as the source for widespread outbreaks of scabies in institutions such as hospitals and care homes.

1G04.Y Other and unspecified scabies

1G05 Tungiasis

A disease of the skin, caused by an infection with the parasite Tunga penetrans. This disease is characterised by lesions (white patch with a black dot in the middle), skin inflammation, or pruritus surrounding the lesion. This disease may also be asymptomatic. Transmission is through the bite of an infected flea, or by direct contact with an infected animal. Confirmation is by identification of Tunga penetrans or travel history.

1G06 Cimicosis

Infestation by bedbugs, which are blood-sucking temporary ectoparasites. The most common species to attack humans is Cimex lectularius. In individuals who are not sensitized by previous exposure, there may be no symptoms or signs other than purpuric macules at the sites of bites. Weals, papules or bullae may occur in sensitized individuals.

1G07 Infestation by mites

Coded Elsewhere: Scabies (1G04)

Cutaneous reactions to zoonotic mites (NE61)

1G07.0 Infestation by Demodex

Infestation with Demodex mites. Demodex folliculorum is a saprophytic mite of the human pilosebaceous unit with a predilection for facial skin and eyelashes. Demodex brevis is found in the sebaceous glands of the eyelash follicle and in the lobules of eyelid meibomian glands. Although infestation is very common and normally symptomless, the mites have been linked to papulopustular rosacea and chronic blepharitis.

1G07.Y Infestation of the skin by other specified parasitic mites

1G0Y **Infestation by other specified ectoparasite**

1G0Z **Infestation by unknown or unspecified ectoparasite**

1G2Y **Other specified parasitic diseases**

1G2Z **Unspecified parasitic diseases**

Sepsis (1G40-1G41)

Coding Note: Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

Exclusions:

Plague (1B93)

Acute or fulminant melioidosis (1C42)

Tularaemia (1B94)

Other infection during labour (JB0D)

Injury or harm arising following infusion, transfusion or therapeutic injection, not elsewhere classified (NE80)

Genital tract or pelvic infection following abortion, ectopic or molar pregnancy (JA05.0)

Disseminated gonococcal infection (1A73)

Extraintestinal yersiniosis (1B9A)

Injury or harm arising from a procedure, not elsewhere classified (NE81)

Meningococcal disease (1C1C)

Systemic inflammatory response syndrome of noninfectious origin (MG46)

Coded Elsewhere: Puerperal sepsis (JB40.0)

Sepsis of fetus or newborn (KA60)

Obstetric pyaemic or septic embolism (JB42.3)

1G40 **Sepsis without septic shock**

Sepsis is defined as a life-threatening organ dysfunction caused by a dysregulated host response to infection.

Coding Note: Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

Exclusions: Septicaemia (MA15.0)

1G41 Sepsis with septic shock

Septic shock is a subset of sepsis in which circulatory, cellular and metabolic abnormalities are profound enough to substantially increase mortality.

Coding Note: Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

Exclusions: Bacteraemia (MA15.0)

1G60 Certain other disorders of infectious origin

Miscellaneous disorders of infectious origin not classifiable elsewhere including those due to algae and oomycetes

1G60.0 Mycetoma of unknown or unspecified type

Mycetoma is a destructive localised chronic infection of skin, subcutaneous tissue and bone, most commonly affecting the foot. It can be caused by either fungi (eumycetoma) or filamentous bacteria (actinomycetoma). Where possible it should be classified more precisely as either actinomycetoma, the commonest type, or eumycetoma

Exclusions: Actinomycetoma (1C43)

Eumycetoma (1F29)

1G60.1 Pythiosis

Pythiosis is a life-threatening infection by the oömycete Pythium insidiosum. Although infection in animals occurs widely across the world, human pythiosis is largely confined to Thailand and, with the exception of ocular disease, is closely associated with underlying haematological disease, especially thalassaemia. There is a high mortality in patients with disseminated or vascular disease. In the latter form, invasion of arterial wall results in vascular occlusion and a frequent need for amputation. Patients with ocular pythiosis commonly require enucleation. A small proportion of infections are limited to the skin and subcutaneous tissues.

1G60.2 Protothecosis

Protothecosis is a rare opportunistic infection in humans caused by achloric algae of the genus Prototheca. The infection is usually localised and may be associated with antecedent local trauma. It is generally located on exposed sites and remains confined to skin and subcutaneous tissues. In immunocompromised patients, however, widespread cutaneous, subcutaneous or deep infection may occur.

1G60.Y Other specified disorders of infectious origin not elsewhere classified

Sequelae of infectious diseases (1G80-1G8Y)

A sequela is a chronic condition resulting from an acute condition and begins during that acute condition. The acute condition is no longer present. The sequela continues after the acute phase of the condition is resolved. For infectious diseases, the original infection is no longer present.

The sequelae categories indicate infections as the cause of sequelae which are themselves classified elsewhere.

Not to be used for chronic infections. Code the chronic infection to chronic or active infectious disease as appropriate.

Use an additional code, if desired, to identify the specific sequelae.

Coded Elsewhere: Sequelae of inflammatory diseases of central nervous system (1D0Y)

1G80 **Sequelae of tuberculosis**

Sequela of tuberculosis is a chronic condition resulting from an acute tuberculosis. Mycobacterium tuberculosis is no longer present. The sequela continues after the acute phase is resolved.

1G81 **Sequelae of trachoma**

This refers to a pathological condition resulting from an infectious disease caused by the Chlamydia trachomatis bacterium which produces a characteristic roughening of the inner surface of the eyelids.

1G82 **Sequelae of leprosy**

This refers to a pathological condition resulting from a chronic disease caused by the bacteria Mycobacterium leprae and Mycobacterium lepromatosis.

1G83 **Sequelae of poliomyelitis**

Sequelae of poliomyelitis refers to the residuals of acute poliomyelitis as well as other disorders that have an etiological link to either the acute polio infection or to chronic deficits resulting from the acute infection. Disorders that may manifest late in the lives of polio survivors include early advanced degenerative arthritis, sleep disorders, respiratory insufficiency, and a variety of mental disorders.

Exclusions: Post polio progressive muscular atrophy (8B62)

1G84 **Sequelae of viral encephalitis**

1G85 **Sequelae of diphtheria**

This refers to conditions that develop as a consequence of a bacterial infection of the respiratory tract with Corynebacterium diphtheriae.

1G8Y **Sequelae of other specified infectious diseases**

1H0Z **Infection, unspecified**

CHAPTER 02

Neoplasms

This chapter has 325 four-character categories.

Code range starts with 2A00

An abnormal or uncontrolled cellular proliferation which is not coordinated with an organism's requirements for normal tissue growth, replacement or repair.

Coded Elsewhere: Inherited cancer-predisposing syndromes

This chapter contains the following top level blocks:

- Neoplasms of brain or central nervous system
- Neoplasms of haematopoietic or lymphoid tissues
- Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues
- In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Inherited cancer-predisposing syndromes

Neoplasms of brain or central nervous system (2A00-2A0Z)

A benign or malignant neoplasm that affects the brain, meninges, or spinal cord. Representative examples of primary neoplasms include astrocytoma, oligodendroglioma, ependymoma, and meningioma.

2A00 **Primary neoplasms of brain**

2A00.0 Gliomas of brain

2A00.00 Glioblastoma of brain

Glioblastomas are malignant astrocytic tumours (grade IV according to the WHO classification). They represent the most frequent brain tumours in adults. They may occur at any age, but 70% of cases are seen in patients between 45 and 70 years of age. The tumours are usually located in the brain hemispheres, but can be found anywhere in the central nervous system.

Inclusions: glioblastoma NOS

2A00.0Y Other specified gliomas of brain

2A00.0Z Gliomas of brain, unspecified

2A00.1 **Embryonal tumours of brain**

2A00.10 Medulloblastoma of brain

A malignant, invasive embryonal neoplasm arising from the cerebellum. It occurs predominantly in children and has the tendency to metastasize via the cerebrospinal fluid pathways. Signs and symptoms include truncal ataxia, disturbed gait, lethargy, headache, and vomiting. There are four histologic variants: anaplastic medulloblastoma, desmoplastic/nodular medulloblastoma, large cell medulloblastoma, and medulloblastoma with extensive nodularity.

2A00.11 Central primitive neuroectodermal tumour

A malignant neoplasm that originates in the neuroectoderm. The neuroectoderm constitutes the portion of the ectoderm of the early embryo that gives rise to the central and peripheral nervous systems and includes some glial cell precursors.

2A00.1Y Other specified embryonal tumours of brain

2A00.1Z Embryonal tumours of brain, unspecified

2A00.2 **Tumours of neuroepithelial tissue of brain**

2A00.20 Tumours of the pineal gland or pineal region

2A00.21 Mixed neuronal-glial tumours

2A00.22 Choroid plexus tumours

2A00.2Y Other specified tumours of neuroepithelial tissue of brain

2A00.2Z Tumours of neuroepithelial tissue of brain, unspecified

2A00.3 **Central neurocytoma of brain**

Central neurocytoma is a very rare brain tumour of young adults. It is typically found in the lateral ventricles and occasionally in the third ventricle. Symptoms are those of increased intracranial pressure.

2A00.4 **Astroblastoma of the brain**

A rare glial neoplasm more commonly found in young adults. It is characterised by tumour cells with characteristics suggestive of an astrocytic origin (positive for GFAP), arranged perivascularly. The cells have broad, non-tapering processes radiating towards a central blood vessel. The biologic behaviour of astroblastomas is variable, so no WHO grade has been established, yet. (Adapted from WHO.)

2A00.5 **Primary neoplasm of brain of unknown or unspecified type**

2A01 Primary neoplasms of meninges

2A01.0 **Meningiomas**

2A01.00 Primary malignant meningioma

2A01.0Y Other specified meningiomas

2A01.0Z Meningiomas, unspecified

2A01.1 **Mesenchymal tumours of meninges**

2A01.2 **Primary neoplasm of meninges of unknown or unspecified type**

2A02 Primary neoplasm of spinal cord, cranial nerves or remaining parts of central nervous system

2A02.0 **Gliomas of spinal cord, cranial nerves or other parts of the central nervous system**

2A02.00 Glioblastoma of spinal cord, cranial nerves or other parts of central nervous system

2A02.0Y Other specified gliomas of spinal cord, cranial nerves or other parts of the central nervous system

2A02.0Z Gliomas of spinal cord, cranial nerves or other parts of the central nervous system, unspecified

2A02.1 **Tumours of cranial or paraspinal nerves**

2A02.10 Malignant peripheral nerve sheath tumour of cranial or paraspinal nerves

Malignant schwannoma is a tumour of the peripheral nervous system that arises in the nerve sheath.

Exclusions: Malignant nerve sheath tumour of peripheral nerves or autonomic nervous system, primary site (2B5E)

2A02.11 Paraspinal neuroblastoma

2A02.12 Malignant neoplasm of the optic nerve

2A02.1Y Other specified tumours of cranial or paraspinal nerves

2A02.1Z Tumours of cranial or paraspinal nerves, unspecified

2A02.2 **Primary neoplasm of spinal cord of unknown or unspecified type**

2A02.3 **Benign neoplasm of cranial nerves**

This is a tumour of cranial nerves having none of the characteristics of a malignant neoplasm.

2A02.4 **Benign neoplasm of spinal cord**

2A0Z Other and unspecified neoplasms of brain or central nervous system

Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

A neoplasm arising from hematopoietic cells found in the bone marrow, peripheral blood, lymph nodes and spleen (organs of the hematopoietic system). Hematopoietic cell neoplasms can also involve other anatomic sites (e.g. central nervous system, gastrointestinal tract), either by haematogenous spread, direct tumour infiltration, or neoplastic transformation of extranodal lymphoid tissues. The commonest forms are the various types of leukaemia, Hodgkin and non-Hodgkin lymphomas, myeloproliferative neoplasms and myelodysplastic syndromes.

Coded Elsewhere: Symptoms of blood, blood-forming organs, or the immune system (MA00-MA0Y)

Myeloproliferative neoplasms (2A20-2A22)

2A20 **Non mast cell myeloproliferative neoplasms**

Coded Elsewhere: Acquired thrombocytosis (3B63.1)

2A20.0 Chronic myelogenous leukaemia, BCR-ABL1-positive

Exclusions: Atypical chronic myeloid leukaemia, BCR-ABL1- negative (2A41)

Chronic myelomonocytic leukaemia (2A40)

Other and unspecified myeloproliferative neoplasms (2A22)

Chronic myeloid leukaemia, not elsewhere classified (2B33.2)

2A20.00 Chronic myelogenous leukaemia with blast crisis

2A20.01 Chronic myelogenous leukaemia, Philadelphia chromosome (Ph1) positive

2A20.02 Chronic myelogenous leukaemia, t(9:22)(q34; q11)

2A20.03 Naegeli-type monocytic leukaemia

2A20.0Y Other specified chronic myelogenous leukaemia, BCR-ABL1-positive

2A20.0Z Chronic myelogenous leukaemia, BCR-ABL1-positive, unspecified

2A20.1 Chronic neutrophilic leukaemia

A rare chronic myeloproliferative neoplasm characterised by sustained peripheral blood neutrophilia, bone marrow hypercellularity due to neutrophilic granulocyte proliferation, and hepatosplenomegaly. The neutrophils lack dysplasia and often show toxic granulations. There is no detectable Philadelphia chromosome or BCR/ABL1 fusion gene.

2A20.2 Primary myelofibrosis

Inclusions: chronic idiopathic myelofibrosis

Exclusions: Acute panmyelosis with myelofibrosis (2A60.38)

2A20.3 **Chronic eosinophilic leukaemia, not elsewhere classified**

A chronic myeloproliferative neoplasm characterised by persistent eosinophilia in the blood, bone marrow and peripheral tissues. Organ damage occurs as a result of leukaemic infiltration or the release of cytokines, enzymes or other proteins by the eosinophils. Chronic eosinophilic leukaemia, not otherwise specified excludes patients with a Ph chromosome, BCR-ABL1 fusion gene or rearrangement of PDGFRA, PDGFRB or FGFR1.

2A20.4 **Polycythaemia vera**

2A20.5 **Non mast cell myeloproliferative neoplasm, unclassifiable**

Cases that have definite features of myeloproliferative neoplasms (MPN), but fail to meet the criteria of a specific MPN subtype.

2A20.Y **Other specified non mast cell myeloproliferative neoplasms**

2A20.Z **Non mast cell myeloproliferative neoplasms, unspecified**

2A21 Mastocytosis

Mastocytosis is due to a clonal, neoplastic proliferation of mast cells that accumulate in one or more organ systems. Activating mutations of KIT are frequently found. It is characterised by the presence of multifocal compact clusters or cohesive aggregates/infiltrates of abnormal mast cells. The disorder is heterogeneous, ranging from skin lesions that may spontaneously regress to highly aggressive neoplasms associated with multiorgan failure and short survival. Subtypes of mastocytosis are recognised mainly by the distribution of the disease and clinical manifestations. In cutaneous mastocytosis (CM), the mast cell infiltration remains confined to the skin, whereas systemic mastocytosis (SM) is characterised by involvement of at least one extracutaneous organ with or without evidence of skin lesions. Mastocytosis should be strictly separated from mast cell hyperplasia or mast cell activation states without morphological and/or molecular abnormalities that characterize the neoplastic proliferation.

2A21.0 **Systemic mastocytosis**

Systemic mastocytosis (SM) comprises a heterogeneous group of rare acquired and chronic haematological malignancies that are related to an abnormal proliferation of mast cells in tissue, including bone marrow, with or without skin involvement. SM can be divided into indolent SM (ISM) and aggressive SM (ASM).

2A21.00 Mast cell leukaemia

2A21.0Y Other specified systemic mastocytosis

2A21.0Z Systemic mastocytosis, unspecified

2A21.1 **Cutaneous mastocytosis**

Cutaneous mastocytosis is characterised by abnormal accumulation and proliferation of cutaneous mast cells. Most types are isolated but cutaneous mastocytosis can occur in association with systemic disease. Clinical forms include cutaneous mastocytoma, urticaria pigmentosa (the most frequent form), pseudoxanthomatous nodular cutaneous mastocytosis, telangiectasia macularis eruptiva perstans and diffuse cutaneous mastocytosis.

2A21.10 Urticaria pigmentosa

Inclusions: Maculopapular cutaneous mastocytosis

2A21.1Y Other specified cutaneous mastocytosis

2A21.2 **Mast cell sarcoma**

A rare entity characterised by localised but destructive growth of a tumour consisting of highly atypical, immature mast cells.

2A21.3 **Extracutaneous mastocytoma**

A localised tumour consisting of mature mast cells.

2A21.Y **Other specified mastocytosis**

2A21.Z **Mastocytosis, unspecified**

2A22 **Other and unspecified myeloproliferative neoplasms**

Exclusions: Chronic myelogenous leukaemia, BCR-ABL1-positive (2A20.0)

Atypical chronic myeloid leukaemia, BCR-ABL1- negative (2A41)

Myelodysplastic syndromes (2A30-2A3Z)

Clonal hematopoietic disorders characterised by dysplasia and ineffective hematopoiesis in one or more of the hematopoietic cell lines. The dysplasia may be accompanied by an increase in myeloblasts, but the number is less than 20% in marrow and blood, which, according to the WHO guidelines, is the requisite threshold for the diagnosis of acute myeloid leukaemia.

Exclusions: Therapy-related myeloid neoplasms (2A60.2)

Drug-induced aplastic anaemia (3A70.10)

2A30 **Refractory anaemia**

2A31 **Refractory neutropaenia**

A myelodysplastic syndrome characterised by the presence of at least 10% dysplastic neutrophils in the bone marrow or the peripheral blood.

2A32 **Refractory thrombocytopenia**

A myelodysplastic syndrome characterised by the presence of at least 10% dysplastic megakaryocytes, found within at least 30 megakaryocytes examined in the bone marrow.

2A33 **Refractory anaemia with ring sideroblasts**

A myelodysplastic syndrome characterised by an anaemia in which 15% or more of the erythroid precursors are ringed sideroblasts. The ring sideroblast is an erythroid precursor in which one third or more of the nucleus is encircled by granules which are positive for iron stain.

2A34 **Refractory cytopenia with multi-lineage dysplasia**

A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in 10% or more of the cells in two or more of the myeloid cell lines.

2A35 **Refractory anaemia with excess of blasts**

A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in one or multiple lineages, with 5-19% myeloblasts in the bone marrow, 2-19% blasts in the blood, or <20% blasts with the presence of Auer rods.

2A36 **Myelodysplastic syndrome with isolated del(5q)**

A myelodysplastic syndrome characterised by anaemia with or without other cytopenias and/or thrombocytosis and in which the sole cytogenetic abnormality is del(5q). Myeloblasts are <5% in the bone marrow and <1% in the blood.

Inclusions: 5 q- syndrome

2A37 **Myelodysplastic syndrome, unclassifiable**

A subtype of myelodysplastic syndrome which at disease presentation lacks findings appropriate for classification into any other MDS category, or has an MDS-associated cytogenetic abnormality and cytopenia, but lack sufficient dysplastic changes in any lineage and have <15% ring sideroblasts.

2A38 **Refractory cytopenia of childhood**

The most common subtype of the myelodysplastic syndromes affecting children. It is characterised by persistent cytopenia with less than 5% blasts in the bone marrow and less than 2% blasts in the peripheral blood.

2A3Y **Other specified myelodysplastic syndromes**

2A3Z **Myelodysplastic syndromes, unspecified**

Myelodysplastic and myeloproliferative neoplasms (2A40-2A4Z)

A category of clonal haematopoietic disorders that have both myelodysplastic and myeloproliferative features at the time of initial presentation.

2A40 **Chronic myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm which is characterised by persistent monocytosis, absence of a Philadelphia chromosome and BCR/ABL1 fusion gene, fewer than 20 percent blasts in the bone marrow and blood, often myelodysplasia, and absence of PDGFRA or PDGFRB rearrangement.

Inclusions: Chronic monocytic leukaemia

Exclusions: Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement (2A50)

Myeloid neoplasm associated with PDGFRB rearrangement (2A51)

2A41 **Atypical chronic myeloid leukaemia, BCR-ABL1- negative**

A myelodysplastic/myeloproliferative neoplasm characterised by the principal involvement of the neutrophil series with leukocytosis with circulating immature myeloid cells, fewer than 20 percent blasts in the bone marrow and blood, and severe dysgranulopoiesis. The neoplastic cells do not have a Philadelphia chromosome or the BCR/ABL1 fusion gene.

2A42 **Juvenile myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm of childhood that is characterised by proliferation principally of the granulocytic and monocytic lineages. Myelomonocytic proliferation is seen in the bone marrow and the blood. The leukemic cells may infiltrate any tissue, however liver, spleen, lymph nodes, skin, and respiratory tract are the most common sites of involvement.

2A42.0 Juvenile myelomonocytic leukaemia in complete remission

2A42.Y Other specified juvenile myelomonocytic leukaemia

2A42.Z Juvenile myelomonocytic leukaemia, unspecified

2A43 **Refractory anaemia with ring sideroblasts associated with marked thrombocytosis**

A provisional entity that encompasses cases with morphologic and clinical characteristics of refractory anaemia with ring sideroblasts, marked thrombocytosis, and abnormal megakaryocytes.

2A44 **Myeloproliferative and myelodysplastic disease, unclassifiable**

This entity includes cases that have clinical, laboratory, and morphologic features that support the diagnosis of both a myelodysplastic syndrome and a myeloproliferative neoplasm, but do not meet the criteria for any of the other entities included in the myelodysplastic/myeloproliferative neoplasm category.

2A4Y **Other specified myelodysplastic and myeloproliferative neoplasms**

2A4Z **Myelodysplastic and myeloproliferative neoplasms, unspecified**

Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1 (2A50-2A5Z)

A group of rare myeloid and lymphoid neoplasms characterised by rearrangement of the PDGFRA, PDGFRB, or FGFR1 genes, resulting in the formation of fusion transcripts and aberrant tyrosine kinase activity. Eosinophilia is a characteristic finding but it is not always present.

2A50 **Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement**

2A51 **Myeloid neoplasm associated with PDGFRB rearrangement**

A distinct type of myeloid neoplasm that occurs in association with rearrangement of PDGFRB gene at 5q32. Patients usually present with a picture resembling chronic myelomonocytic leukaemia and, less often atypical chronic myeloid leukaemia or chronic eosinophilic leukaemia.

2A52 **Myeloid or lymphoid neoplasms with FGFR1 abnormalities**

Hematologic neoplasms characterised by the rearrangement of the FGFR1 gene, resulting in translocations with an 8p11 breakpoint. Patients may present with a myeloproliferative neoplasm, acute myeloid leukaemia, lymphoblastic lymphoma/leukaemia of T or B-cell lineage, or acute leukaemia of mixed phenotype.

2A5Z **Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1, unspecified**

2A60 **Acute myeloid leukaemias and related precursor neoplasms**

Acute myeloid leukaemia is characterised by clonal expansion of myeloid blasts in the peripheral blood and bone marrow. Clinical manifestations are fever, pallor, anaemia, hemorrhages and recurrent infections.

2A60.0 Acute myeloid leukaemia with recurrent genetic abnormalities

2A60.1 Acute myeloid leukaemia with myelodysplasia-related changes

An acute myeloid leukaemia with at least 20% blasts in the bone marrow or blood, and either a previous history of myelodysplastic syndrome, multilineage dysplasia or typical myelodysplastic syndrome-related cytogenetic abnormalities. There is no history of prior cytotoxic therapy for an unrelated disorder, and there is absence of the genetic abnormalities that are present in acute myeloid leukaemia with recurrent genetic abnormalities.

2A60.2 Therapy-related myeloid neoplasms

Inclusions: therapy-related myelodysplastic syndromes

2A60.20 Therapy related acute myeloid leukaemia or myelodysplastic syndrome

2A60.2Y Other specified therapy-related myeloid neoplasms

2A60.2Z Therapy-related myeloid neoplasms, unspecified

2A60.3 Acute myeloid leukaemia, not elsewhere classified by criteria of other types

Acute myeloid leukaemias specified by morphological criteria should only be classified as such, if recurrent genetic abnormalities, prior history of a myelodysplastic syndrome or myelodysplastic/myeloproliferative neoplasm, or history of cytotoxic chemotherapy and/or radiotherapy are absent.

Exclusions: Acute myeloid leukaemia with recurrent genetic abnormalities (2A60.0)

Therapy-related myeloid neoplasms (2A60.2)

Acute myeloid leukaemia with myelodysplasia-related changes (2A60.1)

2A60.30 Acute myeloid leukaemia with minimal differentiation

An acute myeloid leukaemia (AML) in which the blasts do not show evidence of myeloid differentiation by morphology and conventional cytochemistry.

2A60.31 Acute myeloid leukaemia without maturation

An acute myeloid leukaemia (AML) characterised by blasts without evidence of maturation to more mature neutrophils.

2A60.32 Acute myeloid leukaemia with maturation

An acute myeloid leukaemia (AML) characterised by blasts with evidence of maturation to more mature neutrophils.

2A60.33 Acute myelomonocytic leukaemia

An acute leukaemia characterised by the proliferation of both neutrophil and monocyte precursors.

2A60.34 Acute monoblastic or monocytic leukaemia

Acute monoblastic leukaemia and acute monocytic leukaemia are myeloid leukaemias in which 80% or more of the leukaemic cells are of monocytic lineage including monoblasts, promonocytes and monocytes; a minor neutrophil component, <20%, may be present.

2A60.35 Acute erythroid leukaemia

Inclusions: Erythroleukaemia

2A60.36 Acute megakaryoblastic leukaemia

An acute myeloid leukaemia in which at least 50% of the blasts are of megakaryocytic lineage.

Inclusions: Acute myeloid leukaemia, M7

Acute megakaryocytic leukaemia

2A60.37 Acute basophilic leukaemia

An acute myeloid leukaemia in which the immature cells differentiate towards basophils. This is a rare leukaemia.

2A60.38 Acute panmyelosis with myelofibrosis

An acute myeloid leukaemia characterised by bone marrow fibrosis without preexisting primary myelofibrosis.

Inclusions: Acute myelofibrosis

Exclusions: Cases that meet criteria for AML with myelodysplasia related changes (2A60.1)

2A60.39 Myeloid sarcoma

Myeloid sarcoma is a rare solid tumour of the myelogenous cells occurring in an extramedullary site.

Inclusions: Chloroma

Granulocytic sarcoma

2A60.3Y Other specified acute myeloid leukaemia, not elsewhere classified by criteria of other types

2A60.3Z Acute myeloid leukaemia, unspecified

2A60.4 **Myeloid proliferation associated with Down syndrome**

Myeloid neoplasms occurring in individuals with Down syndrome. There is an increased risk of acute leukaemias in both children and adults with Down syndrome. In particular, the incidence of acute myeloid leukaemia in Down syndrome children of less than five years of age is particularly high, it is usually an acute megakaryoblastic leukaemia, and is associated with GATA1 gene mutation. This group of disorders also includes the entity transient abnormal myelopoiesis which occurs in neonates and is associated with GATA1 gene mutation.

2A60.40 Transient abnormal myelopoiesis

A myeloid proliferation occurring in newborns with Down syndrome. It is clinically and morphologically indistinguishable from acute myeloid leukaemia and is associated with GATA1 mutations. The blasts display morphologic and immunophenotypic features of megakaryocytic lineage. In the majority of patients the myeloid proliferation undergoes spontaneous remission.

2A60.41 Myeloid leukaemia associated with Down syndrome

Leukaemia of children with Down syndrome. Encompasses both MDS and AML

2A60.4Y Other specified myeloid proliferation associated with Down syndrome

2A60.4Z Myeloid proliferation associated with Down syndrome, unspecified

2A60.5 **Blastic plasmacytoid dendritic cell neoplasm**

Blastic plasmacytoid dendritic cell neoplasm (BPDCN) is a clinically aggressive tumour derived from the precursors of plasmacytoid dendritic cells (PDCs, also called professional type I interferon–producing cells or plasmacytoid monocytes), with a high frequency of cutaneous and bone marrow involvement and leukaemic dissemination.

There are currently no clues to the etiology of BPDCN, but its association with myelodysplastic syndrome (MDS) in some cases may suggest a related pathogenesis. Gene expression profiling studies have revealed that the neoplastic cells show a gene expression signature similar to that of resting normal PDCs and closer to that of myeloid than of lymphoid precursors.

Inclusions: blastic NK-cell lymphoma

2A60.Y **Other specified acute myeloid leukaemias and related precursor neoplasms**

2A60.Z **Acute myeloid leukaemias and related precursor neoplasms, unspecified**

2A61 Acute leukaemias of ambiguous lineage

An acute leukaemia in which the blasts lack sufficient evidence to classify as myeloid or lymphoid or they have morphologic and/or immunophenotypic characteristics of both myeloid and lymphoid cells.

Precursor lymphoid neoplasms (2A70-2A7Z)

Neoplasms of immature malignant lymphocytes (lymphoblasts) committed to the B-cell or T-cell lineage. Neoplasms involving the bone marrow and the peripheral blood are called precursor lymphoblastic leukaemias or acute lymphoblastic leukaemias. Neoplasms involving primarily lymph nodes or extranodal sites are called lymphoblastic lymphomas.

2A70 **Precursor B-lymphoblastic neoplasms**

Neoplasms of lymphoblasts committed to the B-cell lineage.

2A70.0 B Lymphoblastic leukaemia or lymphoma, not elsewhere classified

Precursor B cell neoplasm without defined recurrent genetic abnormality despite appropriate diagnostics

2A70.1 B lymphoblastic leukaemia or lymphoma with t(9:22) (q34;q11.2); BCR-ABL1

A precursor lymphoid neoplasm which is composed of B-lymphoblasts and carries a translocation between the BCR gene on chromosome 22 and the ABL1 gene on chromosome 9. It results in the production of the p190 kd or p210 kd fusion protein. It has an unfavorable clinical outcome.

2A70.Y Other B-lymphoblastic leukaemia/lymphoma with recurrent genetic abnormalities

2A71 **Precursor T-lymphoblastic neoplasms**

A neoplasm of lymphoblasts committed to the T-cell lineage, typically composed of small to medium-sized blast cells.

2A7Z **Precursor lymphoid neoplasms, unspecified**

Mature B-cell neoplasms (2A80-2A8Z)

Non-Hodgkin lymphomas that originate from mature B lymphocytes. May reside in lymph nodes, lymphatic tissue of different organs or bone marrow and blood (then frequently called leukaemia).

2A80 **Follicular lymphoma**

Follicular lymphoma (FL) is a neoplasm composed of follicle centre (germinal centre) B-cells (typically both centrocytes and centroblasts/large transformed cells), which usually has at least a partially follicular pattern. t(14;18) with BCL2 rearrangement is frequently observed. If diffuse areas of any size comprised predominantly or entirely of blastic cells are present in any case of follicular lymphoma, a diagnosis of diffuse large B-cell lymphoma is also made. Lymphomas composed of centro cytes and centroblasts with an entirely diffuse pattern in the sampled tissue may be included in this category.

Inclusions: follicular lymphoma with or without diffuse areas

Exclusions: Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

2A80.0 Follicular lymphoma grade 1

2A80.1 Follicular lymphoma grade 2

2A80.2 Follicular lymphoma grade 3

2A80.3 Primary cutaneous follicle centre lymphoma

A primary lymphoma of the skin composed of various numbers of small and large irregular neoplastic follicle center cells. Its morphologic pattern can be nodular, diffuse, or nodular and diffuse. It presents with solitary or grouped plaques and tumours, and it usually involves the scalp, forehead, or trunk. It rarely involves the legs. This type of cutaneous lymphoma tends to remain localised to the skin, and it has a favorable prognosis.

2A80.4 Paediatric type follicular lymphoma

A variant of follicular lymphoma often involving cervical or other peripheral lymph nodes and the Waldeyer ring. It is frequently localised, and often lacks BCL-2 protein expression and never has a BCL2 translocation. It is usually but not exclusively seen in the pediatric population. The prognosis is usually favorable.

2A80.5 Follicular lymphoma in situ

2A80.6 Follicular lymphoma of small intestine

2A80.Y Other specified follicular lymphoma

2A80.Z Follicular lymphoma, unspecified

2A81 Diffuse large B-cell lymphomas

Non-Hodgkin lymphomas are characterised by a proliferation of predominantly large neoplastic B lymphocytes.

Coded Elsewhere: Diffuse large B-cell lymphoma of small intestine (2B33.5)

2A81.0 Primary mediastinal large B-cell lymphoma

A large B-cell non-Hodgkin lymphoma arising in the mediastinum. Morphologically it is characterised by a massive diffuse lymphocytic proliferation associated with compartmentalizing fibrosis.

2A81.1 Intravascular large B-cell lymphoma

2A81.2 Plasmablastic lymphoma

An aggressive diffuse large B-cell lymphoma frequently arising in the setting of HIV infection and characterised by the presence of large neoplastic cells resembling B-immunoblasts which have the immunophenotypic profile of plasma cells. Sites of involvement include the oral cavity and other extranodal sites

2A81.3 Lymphomatoid granulomatosis

2A81.4 T-cell/histiocyte rich large B-cell lymphoma

A large B-cell lymphoma characterised by the presence of a limited number of scattered neoplastic large B-lymphocytes which are admixed with numerous non-neoplastic T-lymphocytes and frequently histiocytes.

2A81.5 Primary diffuse large B-cell lymphoma of central nervous system

2A81.6 **Epstein-Barr Virus-positive diffuse large B cell lymphoma of the elderly**

An aggressive diffuse large B-cell lymphoma affecting patients older than 50 years. Epstein-Barr virus is present in all cases. There is no known history of immunodeficiency or prior lymphoma. The majority of patients present with extranodal disease.

2A81.7 **Diffuse large B-cell lymphoma associated with chronic inflammation**

A diffuse large B-cell lymphoma arising in body cavities or narrow spaces of long standing chronic inflammation. The classic example is the pyothorax-associated lymphoma that arises in the pleural cavity of patients with a history of long standing pyothorax.

2A81.8 **ALK-positive large B-cell lymphoma**

A usually aggressive large B-cell lymphoma characterised by the presence of monomorphic immunoblast-like neoplastic B-lymphocytes in a sinusoidal growth pattern. The neoplastic B-lymphocytes express the ALK kinase but they lack the 2;5 translocation.

2A81.9 **Primary effusion lymphoma**

An aggressive non-Hodgkin B-cell lymphoma composed of large cells, presenting as a serous effusion without detectable tumour masses. It is universally associated with human herpes virus 8 (HHV-8)/Kaposi sarcoma herpes virus (KSHV) [HHV-8/KSHV]. It mostly occurs in the setting of immunodeficiency; most cases have been reported in HIV positive patients. The most common sites of involvement are the pleural, pericardial, and peritoneal cavities. The prognosis is extremely unfavorable.

2A81.A **Primary cutaneous diffuse large B-cell lymphoma, leg type**

An aggressive primary cutaneous B-cell lymphoma, usually involving the lower leg. It is composed of a generally monotonous proliferation of immunoblasts, or less frequently centroblasts, with few admixed reactive cells. This type of lymphoma occurs most often in the elderly who present with rapidly growing tumours, usually on one or both legs. Dissemination to extracutaneous sites is frequent.

2A81.Y **Other specified diffuse large B-cell lymphomas**

2A81.Z **Diffuse large B-cell lymphoma, not otherwise specified**

2A82 Mature B-cell neoplasm with leukaemic behaviour

2A82.0 **Chronic lymphocytic leukaemia or small lymphocytic lymphoma**

An indolent, mature B-cell neoplasm composed of small, round B-lymphocytes. When the bone marrow and peripheral blood are involved, the term chronic lymphocytic leukaemia is used. The term small lymphocytic lymphoma is restricted to cases which do not show leukemic involvement of the bone marrow and peripheral blood.

Inclusions: Small cell B-cell lymphoma

2A82.00 Chronic lymphocytic leukaemia of B-cell type

Chronic lymphocytic leukaemia/small lymphocytic lymphoma (CLL/SLL) is a neoplasm composed of monomorphic small, round to slightly irregular B lymphocytes in the peripheral blood (PB), bone marrow (BM), spleen and lymph nodes, admixed with prolymphocytes and paraimmuno - blasts forming proliferation centres in tissue infiltrates.The CLL/SLL cells usually coexpress CD5 and CD23. In the absence of extramedullary tissue involvement, there must be ?5x109/L monoclonal lymphocytes with a CLL phenotype in the PB. The International Workshop on Chronic Lymphocytic leukaemia (IWCLL) report requires that the lymphocytosis be present for at least 3 months and also allows for the diagnosis of CLL to be made with lower lymphocyte counts in patients with cytopenias or disease-related symptoms {873A}. Whether patients who would have fulfilled the criteria in the past for CLL but who fulfill the criteria only for monoclonal B lymphocytosis (MBL) are better considered to have low stage CLL or MBL remains to be determined. Some may prefer to still consider many of these cases more like CLL. The term SLL is used for non-leukaemic cases with the tissue morphology and immunophenotype of CLL. The IWCLL definition of SLL requires lymphadenopathy, no cytopenias due to BM infiltration by CLL/SLL and <5x109/L PB B-cells {873A}.

Inclusions: Lymphoplasmacytic leukaemia

Exclusions: Lymphoplasmacytic lymphoma (2A85.4)

Coded Elsewhere: Richter syndrome (2A81.Y)

2A82.0Y Other specified chronic lymphocytic leukaemia or small lymphocytic lymphoma

2A82.0Z Chronic lymphocytic leukaemia or small lymphocytic lymphoma, unspecified

2A82.1 B-cell prolymphocytic leukaemia

2A82.10 B-cell prolymphocytic leukaemia in complete remission

2A82.1Y Other specified b-cell prolymphocytic leukaemia

2A82.1Z B-cell prolymphocytic leukaemia, unspecified

2A82.2 Hairy-cell leukaemia

A neoplasm of small B-lymphocytes with hairy projections in bone marrow, spleen, and peripheral blood. Most patients present with splenomegaly and pancytopenia.

Inclusions: Leukaemic reticuloendotheliosis

2A82.3 Splenic B-cell lymphoma or leukaemia, unclassifiable

A small B-cell clonal lymphoproliferative disorder of the spleen that does not fall into any of the other categories of mature B-cell neoplasms.

2A82.Y Other specified mature B-cell neoplasm with leukaemic behaviour

2A82.Z Mature B-cell neoplasm with leukaemic behaviour, unspecified

2A83 Plasma cell neoplasms

Plasma cells, usually secreting monoclonal immunoglobulin (M-protein) and/or immunoglobulin light chains.

2A83.0 Monoclonal gammopathy of undetermined significance

2A83.1 **Plasma cell myeloma**

A bone marrow-based plasma cell neoplasm usually characterised by a serum monoclonal protein and/or urinary light chains. ”CRAB” criteria (osteolytic lesions, hypercalcaemia, renal failure, and anaemia) separate symptomatic plasma cell myeloma form asymptomatic (smoldering) myeloma.

Inclusions: Kahler disease

Myelomatosis

Medullary plasmacytoma

multiple myeloma

Exclusions: Solitary plasmacytoma (2A83.2)

2A83.2 **Solitary plasmacytoma**

A single focus of clonal (malignant) plasma cells either in the bone or in another anatomic site without peripheral blood involvement. --2003

Inclusions: Solitary myeloma

2A83.3 **Extraosseous plasmacytoma**

2A83.4 **Plasma cell leukaemia**

An aggressive plasma cell neoplasm. It is characterised by the presence of neoplastic plasma cells in the peripheral blood. The peripheral blood plasma cells comprise more than 20% of the peripheral blood white cells or the number of clonal plasma cells in the PB exceeds 2x10?/L.

2A83.5 **Monoclonal immunoglobulin deposition disease**

2A83.50 Heavy chain deposition disease

A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal alpha, gamma, delta, or mu immunoglobulin heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identifying heavy chain deposition tissue biopsy using immunofluorescence under a microscope.

Exclusions: Heavy chain diseases or malignant immunoproliferative diseases (2A84)

Immunoglobulin heavy chain deficiency (4A01.04)

2A83.51 Light and heavy chain deposition disease

A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal light and heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identification of light and heavy chain deposition tissue biopsy under a microscope.

2A83.52 Light chain deposition disease

A disease of the kidney, caused by the deposition of pieces of truncated or abnormal light chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identification of light chain deposition tissue biopsy under an electron microscope.

Exclusions: Immunodeficiencies with isotype or light chain deficiencies with normal number of B cells (4A01.04)

2A83.Y Other specified multiple myeloma and plasma cell neoplasms

2A83.Z Plasma cell neoplasm, unspecified

2A84 Heavy chain diseases or malignant immunoproliferative diseases

A group of rare disorders of immunoglobulin synthesis associated with B-cell proliferative disorders that produce monoclonal heavy chains and typically no light chains.

2A84.0 Alpha heavy chain disease

The small intestinal morphologic changes are consistent with a mucosa-associated lymphoid tissue lymphoma (MALT lymphoma).

2A84.1 Gamma heavy chain disease

A clonal disorder characterised by the secretion of a truncated gamma chain. In most cases, it is associated with morphologic changes also seen in lymphoplasmacytic lymphomas, but the clinical course is typically more aggressive than in lymphoplasmacytic lymphoma/Waldenstrom's macroglobulinemia.

Inclusions: Franklin disease

2A84.2 Mu heavy chain disease

2A84.Y Other specified malignant immunoproliferative diseases

2A84.Z Heavy chain diseases, unspecified

2A85 Other specified mature B-cell neoplasms or lymphoma

2A85.0 Nodal marginal zone lymphoma

A primary nodal B-cell non-Hodgkin lymphoma which morphologically resembles lymph nodes involved by marginal zone lymphomas of extranodal or splenic types, but without evidence of extranodal or splenic disease. This is a rare entity, and most patients present with localised or generalised lymphadenopathy. The clinical course is indolent.

2A85.1 Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue of stomach

A low grade, indolent B-cell lymphoma, usually associated with Helicobacter pylori infection. Morphologically it is characterised by a dense mucosal atypical lymphocytic (centrocyte-like cell) infiltrate with often prominent lymphoepithelial lesions and plasmacytic differentiation. Some of gastric MALT lymphomas carry the t(11;18)(q21;q21). Such cases are resistant to Helicobacter pylori therapy.

2A85.2 **Extranodal marginal zone B-cell lymphoma, primary site skin**

A low-grade, extranodal marginal zone B-cell lymphoma of the mucosa-associated lymphoid tissue that arises from the skin. It usually presents with multifocal papular or nodular lesions in the arms or trunk. It rarely disseminates to internal organs or progresses to high grade lymphoma.

2A85.3 **Extranodal marginal zone B-cell lymphoma, primary site excluding stomach or skin**

2A85.4 **Lymphoplasmacytic lymphoma**

Neoplasm of small B lymphocytes and plasma cells, mostly residing in the bone marrow. Frequently associated with the production of an IgM serum monoclonal protein, then called Waldenström macroglobulinemia (WM).

Inclusions: primary macroglobulinaemia

Waldenström macroglobulinaemia

Waldenström macroglobulinaemia without mention of remission

Exclusions: small cell B-cell lymphoma (2A82.0)

Chronic lymphocytic leukaemia or small lymphocytic lymphoma (2A82.0)

2A85.5 **Mantle cell lymphoma**

Mantle cell lymphoma is a rare form of malignant non-Hodgkin lymphoma affecting B lymphocytes in the lymph nodes in a region called the ``mantle zone''. It accounts for 2-10% of lymphomas.

Inclusions: Small cell mantle cell lymphoma

2A85.6 **Burkitt lymphoma including Burkitt leukaemia**

A highly aggressive lymphoma composed of monomorphic medium-sized B-cells with basophilic cytoplasm and numerous mitotic figures. It is often associated with the presence of Epstein-Barr virus (EBV) and is commonly seen in AIDS patients. Three morphologic variants are recognised: classical Burkitt lymphoma, Burkitt lymphoma with plasmacytoid differentiation, and atypical Burkitt/Burkitt-like lymphoma. All cases express the MYC translocation [t(8;14)].

Inclusions: “Burkitt-like” lymphoma

Coded Elsewhere: HIV - [human immunodeficiency virus] disease associated with Burkitt lymphoma (1C62.3)

2A85.Y **Further specified mature B-cell neoplasms or lymphoma**

2A86 B-cell lymphoma, mixed features

2A86.0 **Malignant lymphoma of B cell type, not elsewhere classified**

Coding Note: If B-cell lineage or involvement is mentioned in conjunction with a specific lymphoma, code to the more specific description.

2A86.1 **B-cell lymphoma unclassifiable with features intermediate between Burkitt lymphoma and diffuse large B-cell lymphoma**

2A86.2 **B-cell lymphoma unclassifiable with features intermediate between classical Hodgkin lymphoma and diffuse large B-cell lymphoma**

2A86.Y **Other specified B-cell lymphoma, mixed features**

2A86.Z **B-cell lymphoma, mixed features, unspecified**

2A8Z Mature B-cell neoplasms, unspecified

Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

A group of neoplasms composed of T-lymphocytes with a mature (peripheral/post-thymic) immunophenotypic profile and/or NK-cells.

2A90 Mature T-cell lymphoma, specified types, nodal or systemic

2A90.0 **T-cell prolymphocytic leukaemia**

An aggressive T-cell leukaemia, characterised by the proliferation of small to medium sized prolymphocytes with a mature T-cell phenotype, involving the blood, bone marrow, lymph nodes, liver, spleen, and skin.

2A90.1 **T-cell large granular lymphocytic leukaemia**

A T-cell peripheral neoplasm characterised by a persistent (>6 months) increase in the number of peripheral blood large granular lymphocytes, without a clearly identified cause.

2A90.2 **Chronic lymphoproliferative disorders of NK-cells**

Heterogeneous disorders with a chronic clinical course affecting predominantly adults and characterised by the proliferation of large granular lymphocytes with natural killer cell immunophenotype.

2A90.3 **Aggressive NK cell leukaemia**

A rare, highly aggressive, Epstein-Barr virus-associated leukaemia, also known as aggressive NK-cell leukaemia/lymphoma; it may represent the leukemic counterpart of nasal type extranodal NK/T-cell lymphomas. It affects primarily teenagers and young adults. It is characterised by the systemic proliferation of NK cells in the peripheral blood, bone marrow, liver, and spleen.

2A90.4 **Systemic Epstein-Barr Virus-positive T-cell lymphoma of childhood**

This neoplasm of childhood is characterised by a clonal proliferation of EBV-infected T-cells with an activated cytotoxic phenotype. It can occur shortly after primary acute EBV infection or in the setting of chronic active EBV infection (CAEBV).

2A90.5 **Adult T-cell lymphoma or leukaemia, human T-cell lymphotropic virus type 1-associated**

A peripheral (mature) T-cell neoplasm linked to the human T-cell leukaemia virus type 1 (HTLV-1). Adult T-cell leukaemia/lymphoma is endemic in several regions of the world, in particular Japan, the Caribbean, and parts of Central Africa.

Coded Elsewhere: Adult T-cell leukaemia or lymphoma, skin (2B0Y)

2A90.6 **Extranodal NK/T-cell lymphoma, nasal type**

An aggressive, predominantly extranodal, mature T-cell non-Hodgkin lymphoma. It is characterised by an often angiocentric and angiodestructive cellular infiltrate composed of EBV positive NK/T cells. The nasal cavity is the most common site of involvement. Patients often present with midfacial destructive lesions (lethal midline granuloma). The disease may disseminate rapidly to various anatomic sites including the gastrointestinal tract, skin, testis, and cervical lymph nodes. It is also known as angiocentric T-cell lymphoma. The term polymorphic reticulosis has been widely used to describe the morphologic changes seen in this type of lymphoma. However, the latter term may also apply to lymphomatoid granulomatosis, which is an angiocentric and angiodestructive EBV positive B-cell lymphoproliferative disorder.

2A90.7 **Enteropathy associated T-cell lymphoma**

An uncommon mature T-cell lymphoma of intraepithelial lymphocytes. It usually arises from the small intestine, most commonly the jejunum or ileum. Other less frequent primary anatomic sites include the duodenum, stomach, colon, or outside the gastrointestinal tract. Type II of this lymphoma may occur sporadically outside the context of celiac disease.

Inclusions: Enteropathy type intestinal T-cell lymphoma

Intestinal T-cell lymphoma

2A90.8 **Hepatosplenic T-cell lymphoma**

An extranodal, mature T-cell non-Hodgkin lymphoma that originates from cytotoxic T-cells, usually of gamma/delta T-cell type. It is characterised by the presence of medium-size neoplastic lymphocytes infiltrating the hepatic sinusoids. A similar infiltrating pattern is also present in the spleen and bone marrow that are usually involved at the time of the diagnosis.

2A90.9 **Angioimmunoblastic T-cell lymphoma**

A mature T-cell non-Hodgkin lymphoma, characterised by systemic disease and a polymorphous infiltrate involving lymph nodes and extranodal sites. The clinical course is typically aggressive.

Inclusions: AILD - [angioimmunoblastic lymphadenopathy with dysproteinaemia]

2A90.A **Anaplastic large cell lymphoma, ALK-positive**

A T-cell peripheral lymphoma composed of usually large, pleomorphic, CD30 positive T-lymphocytes with abundant cytoplasm characterised by the presence of a translocation involving the ALK gene and expression of ALK fusion protein. Most patients present with peripheral and/or abdominal lymphadenopathy, and often have advanced disease and extranodal involvement.

Inclusions: Anaplastic large cell lymphoma, CD30-positive

2A90.B **Anaplastic large cell lymphoma, ALK-negative**

A T-cell peripheral lymphoma morphologically indistinguishable from anaplastic large cell lymphoma, ALK-positive. It is characterised by the absence of the translocation involving the ALK gene and lacks expression of ALK fusion protein.

Exclusions: Primary cutaneous CD-30 positive T-cell lymphoproliferative disorders (2B03)

2A90.C **Peripheral T-cell lymphoma, not otherwise specified**

A heterogeneous category of nodal and extranodal mature T-cell lymphomas, which do not correspond to any of the specifically defined entities of mature T-cell lymphoma in the current classification.

Inclusions: T-zone variant Peripheral T-cell lymphoma

Lymphoepithelioid lymphoma

Follicular variant Peripheral T-cell lymphoma

Mature T-cell or NK-cell lymphomas and lymphoproliferative disorders, primary cutaneous specified types (2B00-2B0Z)

Primary cutaneous T-cell lymphomas (CTCL) and NK-cell lymphomas are malignant lymphoproliferative diseases of unknown cause that are thought to originate from T-lymphocytes in the lymphoid tissue of the skin and by definition are confined to the skin at initial diagnosis. Included in the class is also a small number of lymphoma-like primary cutaneous lymphoproliferative disorders which are not considered to be truly malignant.

Inclusions: Primary cutaneous peripheral T-cell lymphoma

Exclusions: Skin infiltration by nodal or non-cutaneous extranodal lymphoma (2E08)

2B00 **Subcutaneous panniculitis-like T-cell lymphoma**

Subcutaneous panniculitis-like T-cell lymphoma is a neoplasm of alpha/beta, usually CD8+ T-cells, mainly confined to the subcutis, presenting clinically as subcutaneous nodules which are usually not ulcerated.

2B01 **Mycosis fungoides**

A peripheral (mature) T-cell lymphoma presenting in the skin with patches/plaques or less commonly with tumours or erythroderma. It is characterised by epidermal and dermal infiltration of small to medium-sized T-cells with cerebriform nuclei.

2B02 **Sézary syndrome**

A generalised peripheral (mature) T-cell neoplasm characterised by the presence of erythroderma, lymphadenopathy, and neoplastic, cerebriform T-lymphocytes in the blood. Sézary syndrome is an aggressive disease.

2B03 **Primary cutaneous CD-30 positive T-cell lymphoproliferative disorders**

Primary skin disorders characterised immunohistologically by infiltration by neoplastic CD30+ lymphocytes.

Inclusions: Primary cutaneous CD30+large T-cell lymphoma

2B03.0 **Primary cutaneous CD30 positive anaplastic large cell lymphoma**

An anaplastic large cell lymphoma limited to the skin at the time of diagnosis. Most patients present with solitary or localised skin lesions, which may be tumours, nodules or papules. The t(2;5) translocation that is present in many cases of systemic anaplastic large cell lymphoma, is not found in this disease.

2B03.1 **Lymphomatoid papulosis**

Lymphomatoid papulosis is a proliferation of T-cells, often clonal, characterised clinically by the appearance of crops of dome-shaped papules and nodules which tend to ulcerate and then heal with scarring.

2B0Y **Other specified primary cutaneous mature T-cell or NK-cell lymphomas and lymphoproliferative disorders**

2B0Z **Primary cutaneous T-cell lymphoma of undetermined or unspecified type**

2B2Y **Other specified mature T-cell or NK-cell neoplasms**

2B2Z **Mature T-cell or NK-cell neoplasms, unspecified**

2B30 **Hodgkin lymphoma**

Malignant lymphomas, previously known as Hodgkin's disease, characterised by the presence of large tumour cells in an abundant admixture of nonneoplastic cells. There are two distinct subtypes: nodular lymphocyte predominant Hodgkin lymphoma and classical Hodgkin lymphoma. Hodgkin lymphoma involves primarily lymph nodes.

2B30.0 **Nodular lymphocyte predominant Hodgkin lymphoma**

Nodular lymphocyte predominant Hodgkin lymphoma (NLPHL) is characterised by a nodular, or a nodular and diffuse proliferation of scattered large neoplastic cells known as popcorn or lymphocyte predominant cells (LP cells) —formerly called L&H cells for lymphocytic and/or histiocytic Reed-Sternberg cell variants. At present an overlap between NLPHL and T-cell-rich large B-cell lymphoma cannot be excluded.

2B30.1 **Classical Hodgkin lymphoma**

Classical Hodgkin lymphoma is a B-cell lymphoma characterised histologically by the presence of large mononuclear Hodgkin cells and multinucleated Reed-Sternberg (HRS) cells.

A monoclonal B-cell lymphoproliferation in the vast majority of cases. It is characterised by a bimodal age distribution (15-30 years of life and late life) and is often associated with EBV infection. In less than 5% of cases it is a monoclonal proliferation of T-lymphocytes. Morphologically, it is characterised by the presence of Reed-Sternberg cells and mononuclear Hodgkin cells. The Reed-Sternberg and mononuclear Hodgkin cells are CD30 positive in nearly all cases and CD15 positive in the majority of cases.

Inclusions: Classical Hodgkin lymphoma, type not specified

2B30.10 Nodular sclerosis classical Hodgkin lymphoma

A subtype of classical Hodgkin lymphoma characterised by collagen bands surrounding lymphoid nodules. The lymphoid nodules contain lacunar and Reed-Sternberg cells. Mediastinal involvement occurs in 80% of patients. The prognosis of nodular sclerosis Hodgkin lymphoma is slightly better than that of mixed cellularity or lymphocyte depleted subtype.

2B30.11 Lymphocyte-rich classical Hodgkin lymphoma

2B30.12 Mixed cellularity classical Hodgkin lymphoma

A subtype of classical Hodgkin lymphoma with a mixed inflammatory stroma containing Hodgkin and Reed-Sternberg cells.

2B30.13 Lymphocyte depleted classical Hodgkin lymphoma

2B30.1Z Classical Hodgkin lymphoma, unspecified

2B30.Z **Hodgkin lymphoma, unspecified**

2B31 Histiocytic or dendritic cell neoplasms

True histiocytic malignancies are vanishing diagnoses due to improved understanding of the provenance of malignant cells.

2B31.0 **Juvenile xanthogranuloma**

It is characterised by the presence of lipid-laden, foamy histiocytes and Touton-type giant cells in the dermis.

2B31.1 **Histiocytic sarcoma**

Inclusions: Malignant Histiocytosis

2B31.2 **Langerhans cell histiocytosis**

A neoplastic proliferation of Langerhans cells which contain Birbeck granules by ultrastructural examination. Three major overlapping syndromes are recognised: eosinophilic granuloma, Letterer-Siwe disease, and Hand-Schuller-Christian disease. The clinical course is generally related to the number of organs affected at presentation.

Inclusions: Histiocytosis X

2B31.20 Langerhans cell histiocytosis involving the skin

2B31.2Y Other specified Langerhans cell histiocytosis

2B31.3 **Langerhans cell sarcoma**

A neoplastic proliferation of Langerhans cells with overtly malignant cytologic features. It can be considered a higher grade variant of Langerhans cell histiocytosis (LCH) and it can present de novo or progress from antecedent LCH.

2B31.4 **Interdigitating dendritic cell sarcoma**

A neoplastic proliferation of spindle to ovoid cells which show phenotypic features similar to those of interdigitating dendritic cells. The clinical course is generally aggressive.

2B31.5 **Follicular dendritic cell sarcoma**

A neoplasm composed of spindle to ovoid cells which have morphologic and immunophenotypic characteristics of follicular dendritic cells. It affects lymph nodes and other sites including the tonsils, gastrointestinal tract, spleen, liver, soft tissues, skin, and oral cavity. It usually behaves as a low grade sarcoma. Recurrences have been reported in up to half of the cases.

2B31.6 **Indeterminate cell histiocytosis**

A very rare dendritic cell tumour composed of spindle to ovoid cells with a phenotype that is similar to the Langerhans cells. Patients usually present with cutaneous papules, nodules, and plaques. Systemic symptoms are usually absent. The clinical course is variable.

2B31.7 **Fibroblastic reticular cell tumour**

A very rare dendritic cell tumour affecting the lymph nodes, spleen, and soft tissues. Morphologically it is similar to the interdigitating dendritic cell sarcoma or follicular dendritic cell sarcoma. The tumour cells are positive for cytokeratin and CD68. Clinical outcome is variable.

2B31.Y **Other specified histiocytic or dendritic cell neoplasms**

2B31.Z **Histiocytic or dendritic cell neoplasms, unspecified**

2B32 Immunodeficiency-associated lymphoproliferative disorders

Post-transplant lymphoproliferative disorder (PTLD) is a polyclonal (benign) or clonal (malignant) proliferation of lymphoid cells that develops as a consequence of immunosuppression in a recipient of a solid organ or bone marrow allograft. PTLDs comprise a spectrum ranging from early, Epstein-Barr virus (EBV)-driven polyclonal lymphoid proliferations to EBV-positive or EBV- negative lymphomas of predominantly B-cell or less often T-cell type. In other Immunodeficiency-associated lymphoproliferative disorders, association with EBV is less pronounced.

Inclusions: PTLD - [Post transplant lymphoproliferative disorder]

2B32.0 **Post-transplant lymphoproliferative disorder, early lesion**

A lymphoproliferative disorder arising as a result of post-transplant immunosuppression therapy. It is characterised by the lack of tissue destruction and the architectural preservation of the involved tissues. It includes two morphologic variants: plasmacytic hyperplasia and infectious mononucleosis-like lymphoproliferative disorders.

2B32.1 **Reactive plasmacytic hyperplasia**

2B32.2 **Post-transplant lymphoproliferative disorder, Infectious mononucleosis-like**

2B32.3 **Polymorphic post-transplant lymphoproliferative disorder**

2B32.Y **Other specified immunodeficiency-associated lymphoproliferative disorders**

2B32.Z **Immunodeficiency-associated lymphoproliferative disorders, unspecified**

2B33 Malignant haematopoietic neoplasms without further specification

Coding Note: Only to be designated in cases with incomplete diagnostics.

2B33.0 **Acute leukaemia, not elsewhere classified**

Coding Note: Only to be designated in cases with incomplete diagnostics.

2B33.1 **Myeloid leukaemia**

2B33.2 **Chronic myeloid leukaemia, not elsewhere classified**

Coding Note: Only to be designated in cases. with incomplete diagnostics

2B33.3 **Lymphoid leukaemia, not elsewhere classified**

Coding Note: Only to be designated in cases with incomplete diagnostics.

2B33.4 **Leukaemia, unspecified**

Coding Note: Only to be designated in cases with incomplete diagnostics.

2B33.5 **Malignant lymphoma, not elsewhere classified**

Coding Note: Only to be designated in cases with incomplete diagnostics.

Coded Elsewhere: Enteropathy associated T-cell lymphoma (2A90.7)

2B33.Y **Other malignant haematopoietic neoplasms without further specification**

Coding Note: Only to be designated in cases with incomplete diagnostics.

2B3Z **Neoplasms of haematopoietic or lymphoid tissues, unspecified**

Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2E2Z)

Coding Note: For use of this category, reference should be made to the mortality coding rules and guidelines in the Reference Guide.

Exclusions: Neoplasms of brain or central nervous system (2A00-2A0Z)

Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2D3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

A usually aggressive malignant mesenchymal cell tumour most commonly arising from muscle, fat, fibrous tissue, bone, cartilage, and blood vessels. Sarcomas occur in both children and adults. The prognosis depends largely on the degree of differentiation (grade) of the tumour. Representative subtypes are liposarcoma, leiomyosarcoma, osteosarcoma, and chondrosarcoma.

Exclusions: Mesenchymal tumours of meninges (2A01.1)

Tumours of cranial or paraspinal nerves (2A02.1)

2B50 **Chondrosarcoma, primary site**

Exclusions: Osteosarcoma, primary site (2B51)

2B50.0 **Chondrosarcoma of bone or articular cartilage of limbs**

2B50.1 **Chondrosarcoma of bone or articular cartilage of pelvis**

2B50.2 **Chondrosarcoma of bone or articular cartilage of ribs, sternum or clavicle**

2B50.Y **Chondrosarcoma of bone or articular cartilage of other specified sites**

2B50.Z **Chondrosarcoma of bone or articular cartilage of unspecified sites**

2B51 **Osteosarcoma, primary site**

A usually aggressive malignant bone-forming mesenchymal tumour, predominantly affecting adolescents and young adults. It usually involves bones and less frequently extraosseous sites. It often involves the long bones (particularly distal femur, proximal tibia, and proximal humerus). Pain with or without a palpable mass is the most frequent clinical symptom. It may spread to other anatomic sites, particularly the lungs.

2B51.0 **Osteosarcoma of bone or articular cartilage of jaw**

2B51.1 **Osteosarcoma of bone or articular cartilage of limbs**

2B51.2 **Osteosarcoma of bone or articular cartilage of pelvis**

2B51.Y **Osteosarcoma of bone and articular cartilage of other specified sites**

2B51.Z **Osteosarcoma of bone and articular cartilage of unspecified sites**

2B52 **Ewing sarcoma, primary site**

A small round cell tumour that lacks morphologic, immunohistochemical, and electron microscopic evidence of neuroectodermal differentiation. It represents one of the two ends of the spectrum called Ewing's sarcoma/peripheral neuroectodermal tumour. It affects mostly males under age 20, and it can occur in soft tissue or bone. Pain and the presence of a mass are the most common clinical symptoms.

2B52.0 **Ewing sarcoma of bone or articular cartilage of limbs**

2B52.1 **Ewing sarcoma of bone or articular cartilage of pelvis**

2B52.2 **Ewing sarcoma of bone or articular cartilage of ribs**

2B52.3 **Ewing sarcoma of soft tissue**

A rare malignant neoplasm of the soft tissues. It is typically a disease of children and young adults. It is characterised by t(11:22) (q24: q12) resulting in the expression of EWS/FLI-1 chimeric transcript. Most commonly occurs in the paravertebral region, chest wall, pelvis and lower extremities.

2B52.Y **Ewing sarcoma of bone and articular cartilage of other specified sites**

2B52.Z **Ewing sarcoma of bone and articular cartilage of unspecified sites**

2B53 **Fibroblastic or myofibroblastic tumour, primary site**

2B53.0 **Myxofibrosarcoma, primary site**

2B53.1 **Fibroblastic or myofibroblastic tumour of skin**

2B53.Y **Other specified fibroblastic or myofibroblastic tumour, primary site**

2B53.Z **Fibroblastic or myofibroblastic tumour, primary site, unspecified**

2B54 **Unclassified pleomorphic sarcoma, primary site**

A pleomorphic sarcoma characterised by the presence of fibrohistiocytic cells and spindle cells arranged in a storiform pattern.

2B54.0 **Unclassified pleomorphic sarcoma of skin**

A rare malignant neoplasm arising from the skin. It is characterised by the presence of spindle cells in a storiform pattern and histiocytes with abundant cytoplasm.

Inclusions: malignant fibrous histiocytoma of skin

2B54.1 **Unclassified pleomorphic sarcoma of retroperitoneum or peritoneum**

2B54.Y **Unclassified pleomorphic sarcoma, primary site, other specified site**

2B54.Z **Unclassified pleomorphic sarcoma, primary site, unspecified site**

2B55 **Rhabdomyosarcoma, primary site**

Rhabdomyosarcoma is a malignant soft tissue tumour which develops from cells of striated muscle. It is the most common form of tumour found in children and adolescents.

2B55.0 **Rhabdomyosarcoma of the oral cavity or pharynx**

2B55.1 **Rhabdomyosarcoma of respiratory or intrathoracic organs**

2B55.2 **Rhabdomyosarcoma of male genital organs**

2B55.Y **Rhabdomyosarcoma, other specified primary site**

2B55.Z **Rhabdomyosarcoma, unspecified primary site**

2B56 **Angiosarcoma, primary site**

2B56.0 **Angiosarcoma of heart**

2B56.1 **Angiosarcoma of skin**

A malignant tumour arising from the endothelial cells of the blood vessels. Microscopically, it is characterised by frequently open vascular anastomosing and branching channels. The malignant cells that line the vascular channels are spindle or epithelioid and often display hyperchromatic nuclei. Angiosarcomas most frequently occur in the skin and breast. Patients with long-standing lymphoedema are at increased risk of developing angiosarcoma.

2B56.2 **Angiosarcoma of breast**

A malignant vascular neoplasm arising from the breast.

2B56.3 **Angiosarcoma of liver**

A malignant vascular neoplasm arising from the liver.

Inclusions: Kupffer cell sarcoma of liver

2B56.Y **Angiosarcoma, other specified primary site**

2B56.Z **Angiosarcoma, unspecified primary site**

2B57 **Kaposi sarcoma, primary site**

A malignant neoplasm characterised by a vascular proliferation which usually contains blunt endothelial cells. Erythrocyte extravasation and hemosiderin deposition are frequently present. The most frequent site of involvement is the skin; however it may also occur internally. It generally develops in people with compromised immune systems including those with acquired immune deficiency syndrome (AIDS).

Coded Elsewhere: Human immunodeficiency virus disease associated with Kaposi sarcoma (1C62.3)

2B57.0 **Kaposi sarcoma of lung**

2B57.1 **Kaposi sarcoma of skin**

A Kaposi sarcoma arising from the skin. It presents with patches, plaques, or nodules.

2B57.2 **Kaposi sarcoma of gastrointestinal sites**

2B57.Y **Kaposi sarcoma of other specified primary sites**

2B57.Z **Kaposi sarcoma of unspecified primary site**

2B58 **Leiomyosarcoma, primary site**

2B58.0 **Leiomyosarcoma of retroperitoneum or peritoneum**

2B58.1 **Leiomyosarcoma of uterus**

2B58.2 **Leiomyosarcoma of stomach**

This is a malignant nonepithelial tumour that arises from cells lining the stomach that develop into smooth-muscle.

2B58.Y **Leiomyosarcoma, other specified primary site**

2B58.Z **Leiomyosarcoma, unspecified primary site**

2B59 **Liposarcoma, primary site**

Liposarcoma, a type of soft tissue sarcoma, describes a group of lipomatous tumours of varying severity ranging from slow-growing to aggressive and metastatic. Liposarcomas are most often located in the lower extremities or retroperitoneum, but they can also occur in the upper extremities, neck, peritoneal cavity, spermatic cord, breast, vulva and axilla.

2B59.0 **Liposarcoma of soft tissue of limb**

2B59.1 **Liposarcoma of retroperitoneum or peritoneum**

2B59.2 **Liposarcoma of male genital organs**

2B59.Y **Liposarcoma, other specified primary site**

2B59.Z **Liposarcoma, unspecified primary site**

2B5A **Synovial sarcoma, primary site**

A malignant neoplasm characterised by the chromosomal translocation t(X;18)(p11;q11). It can occur at any age, but mainly affects young adults, more commonly males. Although any site can be affected, the vast majority of the cases arise in the deep soft tissues of extremities, especially around the knee. Microscopically, synovial sarcoma is classified as monophasic (with a spindle or epithelial cell component) or biphasic (with both spindle and epithelial cell components). Synovial sarcomas can recur or metastasize to the lungs, bones, and lymph nodes.

2B5A.0 **Synovial sarcoma of soft tissues of limb**

2B5A.1 **Synovial sarcoma of respiratory or intra-thoracic organs**

2B5A.Y **Synovial sarcoma, other specified primary site**

2B5A.Z **Synovial sarcoma, unspecified primary site**

2B5B **Gastrointestinal stromal tumour, primary site**

This is the most common mesenchymal tumour that arises in the gastrointestinal tract. It is generally immunohistochemically positive for CD117 (KIT), phenotypically paralleling Cajal-cell differentiation, and most examples contain KIT- or PDGFRA-activating mutations. It is most frequent in the stomach and to a lesser degree in the small intestine. The prognosis depends on the tumour size and the mitotic activity.

2B5B.0 **Gastrointestinal stromal tumour of stomach**

A gastrointestinal stromal tumour that arises from the stomach. It covers a spectrum of benign to malignant mesenchymal neoplasms and includes most gastric smooth muscle tumours, leiomyoblastomas, and tumours formerly called gastrointestinal autonomic nerve tumours.

2B5B.1 **Gastrointestinal stromal tumour of small intestine**

A gastrointestinal stromal tumour that arises from the small intestine. It usually affects adults over fifty years of age. The majority of cases have spindle cell morphology. The prognosis depends on the tumour size and the mitotic activity.

2B5B.Y **Gastrointestinal stromal tumour of other gastrointestinal sites**

2B5B.Z **Gastrointestinal stromal tumour of unspecified gastrointestinal sites**

2B5C **Endometrial stromal sarcoma, primary site**

A malignant, infiltrating mesenchymal tumour arising from the uterine corpus, cervix, vagina, and the ovary. Based on its morphologic characteristics, it is classified as either a low grade or an undifferentiated (high grade) stromal sarcoma. The low grade endometrioid stromal sarcoma is characterised by the presence of oval to spindle-shape cells that resemble the cells of the endometrial stroma, without evidence of significant atypia and pleomorphism. Numerous small vessels are also present. The undifferentiated stromal sarcoma is characterised by an aggressive clinical course, the presence of significant cellular atypia, pleomorphism, and high mitotic activity.

2B5D Malignant mixed epithelial mesenchymal tumour, primary site

2B5D.0 Malignant mixed epithelial mesenchymal tumour of ovary

Malignant mixed epithelial mesenchymal tumour of the ovary is a rare and very aggressive neoplasm presenting most commonly in postmenopausal women and is composed of adenocarcinomatous and sarcomatous elements and, depending on the types of these elements, can be classified as homologous or heterologous. It often has a poor prognosis.

2B5D.1 Malignant mixed epithelial and mesenchymal tumour of corpus uteri

A primary malignant neoplasm of the uterine corpus characterised by the presence of an epithelial and a mesenchymal component. This category includes carcinosarcoma, carcinofibroma, and adenosarcoma.

2B5D.Y Malignant mixed epithelial mesenchymal tumour, other specified primary site

2B5D.Z Malignant mixed epithelial mesenchymal tumour, unspecified primary site

2B5E Malignant nerve sheath tumour of peripheral nerves or autonomic nervous system, primary site

Exclusions: Malignant peripheral nerve sheath tumour of cranial or paraspinal nerves (2A02.10)

2B5F Sarcoma, not elsewhere classified, primary site

2B5F.0 Sarcoma, not elsewhere classified of uterus

Coded Elsewhere: Endometrial stromal sarcoma, primary site (2B5C)

Leiomyosarcoma of uterus (2B58.1)

Rhabdomyosarcoma of corpus uteri (2B55.Y)

2B5F.1 Sarcoma, not elsewhere classified of retroperitoneum or peritoneum

2B5F.10 Myosarcomas of omentum

2B5F.1Y Other specified sarcoma, not elsewhere classified of retroperitoneum or peritoneum

2B5F.1Z Sarcoma, not elsewhere classified of retroperitoneum or peritoneum, unspecified

2B5F.2 Sarcoma, not elsewhere classified of other specified sites

2B5F.3 Sarcoma, not elsewhere classified, primary site unknown

2B5G Myosarcoma of uterus, part not specified

Coded Elsewhere: Leiomyosarcoma of uterus (2B58.1)

Rhabdomyosarcoma of corpus uteri (2B55.Y)

2B5H Well differentiated lipomatous tumour, primary site

2B5J Malignant miscellaneous tumours of bone or articular cartilage of other or unspecified sites

Exclusions: Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

2B5K **Unspecified malignant soft tissue tumours or sarcomas of bone or articular cartilage of other or unspecified sites**

2B5Y **Other specified malignant mesenchymal neoplasms**

2B5Z **Malignant mesenchymal neoplasm of unspecified type**

Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Z)

Squamous cell carcinomas amount to more than 90% of malignant tumours of the oral cavity and oropharynx. As in other parts of the upper aerodigestive tract, there is a strong and synergistic association with tobacco smoking and alcohol abuse. In some regions, particularly the Indian subcontinent, oral cancer is among the most frequent malignancies, largely due to tobacco chewing.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B60 **Malignant neoplasms of lip**

Malignant neoplasms originating from the transitional epithelium of the lip (excluding oral mucosa and skin of the outer lip) or from the underlying anatomical structures (e.g. orbicularis oris muscle).

Exclusions: Malignant neoplasm of skin of lip (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B60.0 Basal cell carcinoma of lip

A basal cell carcinoma arising from the lip.

2B60.1 Squamous cell carcinoma of lip

Squamous cell carcinoma located on or originating in the mucosa or vermilion of the lip, including the vermilion border but excluding the skin of the lip.

Exclusions: Squamous cell carcinoma of skin of lip (2C31)

2B60.Y Other specified malignant neoplasms of lip

2B60.Z Malignant neoplasms of lip, unspecified

2B61 **Malignant neoplasms of base of tongue**

A primary neoplasm involving the base of the tongue, often associated with chronic alcohol and tobacco use, older age, certain geographic locations, a family history of upper aeordigestive tract cancers and/or certain nutritional deficiencies and infectious agents.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B61.0 Squamous cell carcinoma of the base of the tongue

A carcinoma that arises from the base of the tongue. Representative examples include squamous cell carcinoma, adenoid cystic carcinoma, and mucoepidermoid carcinoma.

2B61.Y Other specified malignant neoplasms of base of tongue

2B61.Z **Malignant neoplasms of base of tongue, unspecified**

2B62 **Malignant neoplasms of other or unspecified parts of tongue**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B62.0 **Squamous cell carcinoma of other or unspecified parts of tongue**

2B62.1 **Malignant neoplasms of lingual tonsil**

2B62.10 Squamous cell carcinoma of lingual tonsil

2B62.Y **Other specified malignant neoplasms of other and unspecified parts of tongue**

2B62.Z **Malignant neoplasms of other or unspecified parts of tongue, unspecified**

2B63 **Malignant neoplasms of gum**

Exclusions: Benign osteogenic tumours of bone or articular cartilage of skull or face (2E83.0)

Benign osteogenic tumours of bone or articular cartilage of lower jaw (2E83.1)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B63.0 **Squamous cell carcinoma of gum**

2B63.Y **Other specified malignant neoplasm of gum**

2B63.Z **Malignant neoplasms of gum, unspecified**

2B64 **Malignant neoplasms of floor of mouth**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B64.0 **Squamous cell carcinoma of floor of mouth**

2B64.Y **Other specified malignant neoplasm of floor of mouth**

2B64.Z **Malignant neoplasms of floor of mouth, unspecified**

2B65 **Malignant neoplasms of palate**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B65.0 **Adenocarcinoma of palate**

2B65.1 **Squamous cell carcinoma of palate**

2B65.Y **Other specified malignant neoplasm of palate**

2B65.Z **Malignant neoplasms of palate, unspecified**

2B66 **Malignant neoplasms of other or unspecified parts of mouth**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B66.0 **Squamous cell carcinoma of other or unspecified parts of mouth**

2B66.Y **Other specified malignant neoplasms of other and unspecified parts of mouth**

2B66.Z **Malignant neoplasms of other or unspecified parts of mouth, unspecified**

2B67 Malignant neoplasms of parotid gland

Salivary gland tumours can show a striking range of morphological diversity between different tumour types and sometimes within an individual tumour mass. In addition, hybrid tumours, dedifferentiation and the propensity for some benign tumours to progress to malignancy can confound histopathological interpretation. These features, together with the relative rarity of a number of tumours, can sometimes make diagnosis difficult, despite the abundance of named tumour entities. The increasing use of pre-operative fine needle aspiration biopsies also needs to be taken into account, as artifactual changes may be superimposed on the tumours. Unfortunately, the morphological variability of these tumours is mirrored by the immunocytochemical profiles, so that special stains are rarely useful in routine diagnosis of salivary gland epithelial neoplasms.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B67.0 **Adenocarcinoma of parotid gland**

2B67.1 **Squamous cell carcinoma of parotid gland**

2B67.Y **Other specified malignant neoplasms of parotid gland**

2B67.Z **Malignant neoplasms of parotid gland, unspecified**

2B68 Malignant neoplasms of submandibular or sublingual glands

Salivary gland tumours can show a striking range of morphological diversity between different tumour types and sometimes within an individual tumour mass. In addition, hybrid tumours, dedifferentiation and the propensity for some benign tumours to progress to malignancy can confound histopathological interpretation. These features, together with the relative rarity of a number of tumours, can sometimes make diagnosis difficult, despite the abundance of named tumour entities. The increasing use of pre-operative fine needle aspiration biopsies also needs to be taken into account, as artifactual changes may be superimposed on the tumours. Unfortunately, the morphological variability of these tumours is mirrored by the immunocytochemical profiles, so that special stains are rarely useful in routine diagnosis of salivary gland epithelial neoplasms.

Exclusions: Malignant neoplasms of parotid gland (2B67)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B68.0 **Adenocarcinoma of submandibular or sublingual glands**

2B68.1 **Squamous cell carcinoma of submandibular or sublingual glands**

2B68.2 **Other specified malignant neoplasms of submandibular or sublingual glands**

2B68.Z **Malignant neoplasms of submandibular or sublingual glands, unspecified**

2B69 **Malignant neoplasms of tonsil**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Malignant neoplasms of pharyngeal tonsil (2B6B.2)

Malignant neoplasms of lingual tonsil (2B62.1)

2B69.0 Squamous cell carcinoma of tonsil

2B69.1 Other specified malignant neoplasms of tonsil

2B69.Z Malignant neoplasms of tonsil, unspecified

2B6A **Malignant neoplasms of oropharynx**

Malignant neoplasms of the oral cavity and pharynx

Exclusions: Malignant neoplasms of palate (2B65)

Malignant neoplasms of tonsil (2B69)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B6A.0 Squamous cell carcinoma of oropharynx

A squamous cell carcinoma arising from the oropharynx. It predominantly affects adults in their fifth and sixth decades of life and is associated with alcohol and tobacco use. Human papillomavirus is present in approximately half of the cases. It is characterised by a tendency to metastasize early to the lymph nodes. When the tumour is small, patients are often asymptomatic. Physical examination may reveal erythematous or white lesions or plaques. The majority of patients present with locally advanced disease. Signs and symptoms include mucosal ulceration, pain, bleeding, weight loss, neck swelling, and difficulty speaking, chewing, and swallowing. Patients may also present with swollen neck lymph nodes without any symptoms from the oropharyngeal tumour. The most significant prognostic factors are the size of the tumour and the lymph nodes status.

2B6A.Y Other specified malignant neoplasms of oropharynx

2B6A.Z Malignant neoplasms of oropharynx, unspecified

2B6B **Malignant neoplasms of nasopharynx**

A wide variety of tumours can arise in the nasopharynx, but it is nasopharyngeal carcinoma that has fascinated generations of oncologists, pathologists, scientists and epidemiologists. It shows marked geographic differences, with highest incidence rates in Southern Chinese. In some endemic areas, the incidence has declined by about 30% over the past two decades, suggesting that environmental or lifestyle factors may play a major role and that the disease is, to some extent, preventable. Nasopharyngeal carcinoma shows a very strong association with Epstein-Barr virus (EBV) infection, irrespective of the ethnic origin of the patients. This association has pioneered a new paradigm of utilizing viral serological tests for the diagnosis of cancer and for screening in high-risk populations. Naso - pharyngeal carcinoma is generally responsive to radiation therapy, and the clinical outcome has greatly improved over the years, due to refinements in staging and to improved therapy protocols. The unusual and often deceptive histological features of nasopharyngeal carcinoma have generated controversies over the nature of the tumour and still pose a challenge to surgical pathologists. There have possibly been more names invented for the various histological subtypes of nasopharyngeal carcinoma than any other tumour type.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B6B.0 Squamous cell carcinoma of nasopharynx

2B6B.1 Malignant epithelial neoplasms of nasopharynx, unspecified type

2B6B.2 Malignant neoplasms of pharyngeal tonsil

2B6B.20 Squamous cell carcinoma of pharyngeal tonsil

2B6B.21 Other or unspecified malignant epithelial neoplasm of pharyngeal tonsil

2B6B.2Y Other specified malignant neoplasms of pharyngeal tonsil

2B6B.2Z Malignant neoplasm of pharyngeal tonsil without mention of type

2B6B.Y Other specified malignant neoplasms of nasopharynx

2B6B.Z Malignant neoplasms of nasopharynx, unspecified

2B6C **Malignant neoplasms of piriform sinus**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B6C.0 Squamous cell carcinoma of piriform sinus

2B6C.Y Other specified malignant neoplasms of piriform sinus

2B6C.Z Malignant neoplasms of piriform sinus, unspecified

2B6D **Malignant neoplasms of hypopharynx**

A malignant neoplasm arising in the hypopharynx.

Exclusions: Malignant neoplasms of piriform sinus (2B6C)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B6D.0 **Squamous cell carcinoma of hypopharynx and variants**

A squamous cell carcinoma arising from the hypopharynx. Signs and symptoms include dysphagia, hemoptysis, and the presence of a neck mass.

2B6D.Y **Other specified malignant neoplasms of hypopharynx**

2B6D.Z **Malignant neoplasms of hypopharynx, unspecified**

2B6E **Malignant neoplasms of other or ill-defined sites in the lip, oral cavity or pharynx**

Exclusions: Malignant neoplasm of oral cavity NOS (2B66)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2B6E.0 **Squamous cell carcinoma of other or ill-defined sites in the lip, oral cavity or pharynx**

2B6E.Y **Other specified malignant neoplasms of other or ill-defined sites in the lip, oral cavity or pharynx**

2B6E.Z **Malignant neoplasms of other or ill-defined sites in the lip, oral cavity or pharynx, unspecified**

2B6Y **Other specified malignant neoplasms of lip, oral cavity or pharynx**

2B6Z **Malignant neoplasms of lip, oral cavity or pharynx, unspecified**

Malignant neoplasms of digestive organs (2B70-2C1Z)

A primary malignant neoplasm involving any part of the gastrointestinal system.

Exclusions: Malignant neoplasm metastasis in digestive system (2D80-2D8Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Z)

2B70 **Malignant neoplasms of oesophagus**

A primary malignant neoplasm involving the oesophagus

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B70.0 **Adenocarcinoma of oesophagus**

A malignant tumour with glandular differentiation arising predominantly from Barrett mucosa in the lower third of the esophagus. Grossly, esophageal adenocarcinomas are similar to esophageal squamous cell carcinomas. Microscopically, adenocarcinomas arising in the setting of Barrett esophagus are typically papillary and/or tubular. The prognosis is poor.

2B70.00 Barrett adenocarcinoma

Barrett adenocarcinoma is defined as adenocarcinoma of lower oesophagus and gastroesophageal junction associated with Barrett's oesophagus.

2B70.0Y Other specified adenocarcinoma of oesophagus

2B70.0Z Adenocarcinoma of oesophagus, unspecified

2B70.1 Squamous cell carcinoma of oesophagus

A squamous cell carcinoma arising from the esophagus. It can be associated with a long history of tobacco and alcohol abuse and is exceedingly rare before the age of 30. The median age is around 65 in both males and females, but the incidence in males is much higher than in females. It is located mostly in the middle and lower third of the esophagus. Grossly, polypoid, ulcerated, plaque-like and occult lesions have been described. The microscopic features are the same as in other squamous cell carcinomas. Any degree of differentiation may occur, and variation within a single tumour is common. The prognosis is poor.

2B70.Y Other specified malignant neoplasms of oesophagus

2B70.Z Malignant neoplasms of oesophagus, unspecified

2B71 Malignant neoplasms of oesophagogastric junction

Malignant neoplasms that arise from the cells of the oesophagogastric junction (OGJ), which is defined as the point at which the oesophagus ends and the stomach begins. This mainly defines adenocarcinomas that straddle the junction of the oesophagus and stomach. This definition includes many tumours formally called cancers of the gastric cardia.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B71.0 Adenocarcinoma of oesophagogastric junction

An adenocarcinoma that arises from and straddles the junction of the stomach and esophagus. The category of adenocarcinomas of the gastroesophageal junction also includes the majority of adenocarcinomas previously called gastric cardia adenocarcinomas. Squamous cell carcinomas that affect or cross the junction of the stomach and esophagus are classified as carcinomas of the distal esophagus. Adenocarcinoma of the gastroesophageal junction occurs more often in Caucasian middle aged and elderly males. Clinical signs and symptoms include dysphagia, abdominal pain, and weight loss. The prognosis depends on the completeness of the surgical resection, the number of lymph nodes involved by cancer, and the presence or absence of postoperative complications.

2B71.Y Other specified malignant neoplasm of oesophagogastric junction

2B71.Z Malignant neoplasms of oesophagogastric junction, unspecified

2B72 Malignant neoplasms of stomach

A primary or metastatic malignant neoplasm involving the stomach.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue of stomach (2A85.1)

Leiomyosarcoma of stomach (2B58.2)

Gastrointestinal stromal tumour of stomach (2B5B.0)

Gastric malignant lymphoma (2B33.5)

2B72.0 Adenocarcinoma of stomach

An adenocarcinoma arising from the stomach glandular epithelium. Gastric adenocarcinoma is primarily a disease of older individuals. It most commonly develops after a long period of atrophic gastritis and is strongly associated with Helicobacter pylori infection. The lack of early symptoms often delays the diagnosis of gastric cancer. The majority of patients present with advanced tumours which have poor rates of curability. Microscopically, two important histologic types of gastric adenocarcinoma are recognised: the intestinal and diffuse type. The overall prognosis of gastric adenocarcinomas is poor, even in patients who receive a curative resection.

2B72.1 Malignant neuroendocrine neoplasm of stomach

A neoplasm with neuroendocrine differentiation that arises from the stomach. It includes well differentiated neuroendocrine tumours (low and intermediate grade) and poorly differentiated neuroendocrine carcinomas (high grade).

Inclusions: carcinoid and other malignant neuroendocrine neoplasms

Coded Elsewhere: Neuroendocrine neoplasm of duodenum (2B80.01)

Neuroendocrine neoplasms of appendix (2B81.2)

2B72.Y Other specified malignant neoplasms of stomach

2B72.Z Malignant neoplasms of stomach, unspecified

Malignant neoplasms of intestine (2B80-2C0Z)

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B80 **Malignant neoplasms of small intestine**

A primary malignant neoplasm involving the small intestine.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Enteropathy associated T-cell lymphoma (2A90.7)

Gastrointestinal stromal tumour of small intestine (2B5B.1)

Malignant lymphoma of small intestine (2B33.5)

Malignant neoplasm of jejunum (2B80.1Z)

Malignant neoplasm of ileum (2B80.1Z)

Small intestinal leiomyosarcoma (2B58.Y)

2B80.0 Malignant neoplasms of duodenum

A primary malignant neoplasm that affects the duodenum. Representative examples include carcinoma, lymphoma, and sarcoma.

Coded Elsewhere: Lymphoma of duodenum (2B33.5)

Malignant mesenchymal tumour of the duodenum (2B5F.2)

2B80.00 Adenocarcinoma of duodenum

An adenocarcinoma that arises from the duodenum.

2B80.01 Neuroendocrine neoplasm of duodenum

Neoplasms that arise from the cells of neuroendocrine system lining the duodenum.

2B80.0Y Other specified malignant neoplasms of the duodenum

2B80.0Z Malignant neoplasms of duodenum, unspecified

2B80.1 Malignant neoplasms of jejunum or ileum

2B80.10 Adenocarcinoma of jejunum or ileum

2B80.11 Neuroendocrine neoplasms of jejunum or ileum

Neoplasms that arise from the cells of neuroendocrine system lining the jejunum or ileum including well-differentiated (low- to intermediated grade) neuroendocrine tumours. These include carcinoid tumour.

2B80.1Y Other specified malignant neoplasms of jejunum or ileum

2B80.1Z Malignant neoplasms of jejunum or ileum, unspecified

2B80.2 Malignant neoplasms of small intestine, site unspecified

2B80.20 Adenocarcinoma of small intestine, site unspecified

A malignant tumour with glandular differentiation arising from epithelium of small intestine.

Exclusions: Neuroendocrine neoplasms of small intestine, site unspecified (2B80.21)

2B80.21 Neuroendocrine neoplasms of small intestine, site unspecified

Neoplasms that arise from the cells of neuroendocrine system lining the small intestine.

2B80.2Y Other specified malignant neoplasms of small intestine, site unspecified

2B80.Y Other specified malignant neoplasms of small intestine

2B80.Z Malignant neoplasms of small intestine, unspecified

2B81 **Malignant neoplasms of appendix**

A primary malignant neoplasm that affects the appendix.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Lymphoma of the appendix (2B33.5)

2B81.0 Adenocarcinoma of appendix

A malignant neoplasm arising from the glandular epithelium of the appendix. Most are mucinous adenocarcinomas.

2B81.00 Mucinous adenocarcinoma of appendix

An adenocarcinoma, often cystic, with large amounts of extracellular mucin

2B81.2 **Neuroendocrine neoplasms of appendix**

Malignant neoplasms with neuroendocrine differentiation that arise in the appendix. Most are well differentiated neuroendocrine tumours (low and intermediate grade), i.e. carcinoids. Poorly differentiated neuroendocrine carcinomas (high grade) are exceedingly rare.

2B81.Y **Other specified malignant neoplasms of appendix**

2B81.Z **Malignant neoplasms of appendix, unspecified**

Malignant neoplasms of large intestine (2B90-2B9Y)

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2B90 **Malignant neoplasms of colon**

Primary malignant neoplasms arising in the colon.

Exclusions: Malignant neoplasms of appendix (2B81)

Coded Elsewhere: Gardner syndrome (LD2D.3)

Malignant Lymphoma of colon (2B33.5)

Gastrointestinal stromal tumour of colon (2B5B.Y)

Kaposi sarcoma of colon (2B57.2)

Leiomyosarcoma of colon (2B58.Y)

2B90.0 **Malignant neoplasm of ascending colon and right flexure of colon**

2B90.00 Adenocarcinoma of ascending colon or right flexure of colon

A malignant tumour with glandular differentiation arising from epithelium of ascending colon and right flexure.

2B90.0Y Other specified malignant neoplasm of ascending colon and right flexure of colon

2B90.0Z Malignant neoplasm of ascending colon and right flexure of colon, unspecified

2B90.1 **Malignant neoplasm of descending colon and splenic flexure of colon**

2B90.10 Adenocarcinoma of descending colon or splenic flexure of colon

A malignant tumour with glandular differentiation arising from epithelium of descending colon and splenic flexure.

2B90.1Y Other specified malignant neoplasm of descending colon and splenic flexure of colon

2B90.1Z Malignant neoplasm of descending colon and splenic flexure of colon, unspecified

2B90.2 **Malignant neoplasm of transverse colon**

2B90.20 Adenocarcinoma of transverse colon

A malignant tumour with glandular differentiation arising from epithelium of transverse colon.

2B90.2Y Other specified malignant neoplasm of transverse colon

2B90.2Z Malignant neoplasm of transverse colon, unspecified

2B90.3 **Malignant neoplasm of sigmoid colon**

Exclusions: Malignant neoplasms of rectosigmoid junction (2B91)

2B90.30 Adenocarcinoma of sigmoid colon

A malignant tumour with glandular differentiation arising from epithelium of descending colon and splenic flexure.

2B90.3Y Other specified malignant neoplasm of sigmoid colon

2B90.3Z Malignant neoplasm of sigmoid colon, unspecified

2B90.Y **Other specified malignant neoplasms of colon**

2B90.Z **Malignant neoplasms of colon, unspecified**

2B91 Malignant neoplasms of rectosigmoid junction

2B91.0 **Adenocarcinoma of rectosigmoid junction**

A malignant tumour with glandular differentiation arising from epithelium of rectosigmoid junction

2B91.Y **Other specified malignant neoplasms of rectosigmoid junction**

2B91.Z **Malignant neoplasms of rectosigmoid junction, unspecified**

2B92 Malignant neoplasms of rectum

Coded Elsewhere: Malignant mesenchymal tumour of rectum (2B5F.2)

2B92.0 **Adenocarcinomas of rectum**

An adenocarcinoma arising from the rectum. It is more frequently seen in populations with a Western type diet and in patients with a history of chronic inflammatory bowel disease.

2B92.1 **Neuroendocrine neoplasms of rectum**

Malignant neoplasms with neuroendocrine differentiation that arise in the rectum. Most are well differentiated neuroendocrine tumours (low and intermediate grade), i.e. carcinoids. Poorly differentiated neuroendocrine carcinomas (high grade) are rare.

2B92.Y **Other specified malignant neoplasms of rectum**

2B92.Z **Malignant neoplasms of rectum, unspecified**

2B93 Malignant neoplasms of large intestine, site unspecified

2B93.0 **Adenocarcinoma of large intestine, site unspecified**

2B93.Y **Other specified malignant neoplasms of large intestine, site unspecified**

2B93.Z **Malignant neoplasms of large intestine, site and type unspecified**

2B9Y Other specified malignant neoplasms of large intestine

2C00 Malignant neoplasms of anus or anal canal

A primary malignant neoplasm that arises in the anal canal up to the junction with perianal, hair-bearing skin. Representative examples include carcinomas and melanomas. Tumours of the anal margin are classified with skin tumours.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C00.0 Adenocarcinoma of anus or anal canal

An adenocarcinoma arising in the anal canal epithelium, including the mucosal surface, the anal glands, and the lining of fistulous tracts.

2C00.1 Melanoma of anus or anal canal

A form of cancer that develops in melanocytes, the cells that produce pigment melanin in the skin.

2C00.2 Neuroendocrine neoplasm of anus or anal canal

Neoplasms that arise from the cells of the neuroendocrine system lining the anus and anal canal.

2C00.3 Squamous cell carcinoma of anus or anal canal

A squamous cell carcinoma (SCC) arising from the anal canal up to the junction with the anal margin (perianal, hair-bearing skin). Human papillomavirus is detected in the majority of cases. Homosexual HIV-positive men have an increased risk of developing anal squamous cell carcinoma in comparison to the general male population. The prognosis is generally better for anal margin SCC than for anal canal SCC. The former are classified with skin tumours.

2C00.Y Other specified malignant neoplasms of anus and anal canal

2C00.Z Malignant neoplasms of anus or anal canal, unspecified

2C0Y Other specified malignant neoplasms of intestine

2C0Z Malignant neoplasms of intestine, unspecified

2C10 Malignant neoplasm of pancreas

A primary malignant tumour of the pancreas. Most are adenocarcinomas.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C10.0 Adenocarcinoma of pancreas

An adenocarcinoma which arises from the exocrine pancreas. Ductal adenocarcinoma and its variants are the most common types of pancreatic adenocarcinoma.

2C10.1 Neuroendocrine neoplasms of pancreas

A neoplasm with neuroendocrine differentiation that arises from the pancreas. It includes neuroendocrine tumours (low and intermediate grade) and neuroendocrine carcinomas (high grade).

2C10.Y Other specified malignant neoplasms of pancreas

2C10.Z **Malignant neoplasm of pancreas, unspecified**

2C11 Malignant neoplasms of other or ill-defined digestive organs

A primary malignant tumour involving a digestive organ or organs not coded elsewhere (including intestinal tract [part unspecified], overlapping lesions of the digestive tract and other ill-defined sites within the digestive system)

Exclusions: Malignant neoplasms of retroperitoneum (2C50)

Malignant neoplasms of peritoneum (2C51)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C11.0 **Adenocarcinoma of other or ill-defined digestive organs**

2C11.1 **Mucinous carcinoma of other or ill-defined digestive organs**

2C11.2 **Other specified malignant neoplasms of other or ill-defined digestive organs**

2C11.Z **Malignant neoplasms of other or ill-defined digestive organs, unspecified**

2C12 Malignant neoplasms of liver or intrahepatic bile ducts

The most frequent and important hepatic neoplasm is the primary hepatocellular carcinoma (HCC). In many parts of the world, in particular Africa and Asia, it poses a significant disease burden. In these high incidence regions, chronic infection with hepatitis B virus (HBV) is the principal underlying cause, with the exception of Japan which has a high prevalence of hepatitis C infection. HBV vaccination has become a powerful tool in reducing cirrhosis and HCC, but implementation is still suboptimal in several high risk regions. In Western countries, chronic alcohol abuse is a major aetiological factor. Hepatic cholangiocarcinoma has a different geographical distribution, with peak incidences in Northern Thailand. Here, it is caused by chronic infection with the liver fluke, Opisthorchis Viverrini, which is ingested through infected raw fish.

Exclusions: Secondary malignant neoplasm of liver (2D80)

Malignant neoplasm of biliary tract NOS (2C17)

2C12.0 **Malignant neoplasm of liver**

2C12.00 Combined hepatocellular-cholangiocarcinoma

Combined hepatocellular-cholagiocarcinoma is a tumour containing unequivocal, intimately mixed elements of both hepatocellular carcinoma and cholangiocarcinoma.

Inclusions: Hepatocholangiocarcinoma

2C12.01 Hepatoblastoma

A malignant liver neoplasm that occurs almost exclusively in infants, although isolated cases in older children and adults have been reported. Grossly, hepatoblastoma is solid, well circumscribed, and more often solitary than multiple. Microscopically, most of the tumours are composed exclusively of immature hepatocytic elements. About a fourth of hepatoblastomas contain a stromal component that may be undifferentiated or develop into bone or cartilage.

2C12.02 Hepatocellular carcinoma of liver

A carcinoma that arises from the hepatocytes.

2C12.03 Mesothelial carcinoma of liver

2C12.0Y Other specified malignant neoplasm of liver

2C12.1 Malignant neoplasm of intrahepatic bile ducts

2C12.10 Intrahepatic cholangiocarcinoma

A carcinoma that arises from the intrahepatic bile duct epithelium in any site of the intrahepatic biliary tree. Grossly, the malignant lesions are solid, nodular, and grayish. Morphologically, the vast majority of cases are adenocarcinomas. Early detection is difficult and the prognosis is generally poor.

2C12.1Y Other specified malignant neoplasms of intrahepatic bile ducts

2C12.Z Malignant neoplasms of liver or intrahepatic bile ducts, unspecified

2C13 Malignant neoplasms of gallbladder

A malignant tumour arising from the epithelium of the gallbladder. It is usually associated with the presence of gallstones. Clinical symptoms are not specific and usually present late in the course. Morphologically, adenocarcinoma is the most common type, however squamous cell carcinomas, adenosquamous carcinomas, signet ring carcinomas, and undifferentiated carcinomas can also occur.

2C13.0 Adenocarcinoma of the gallbladder

An adenocarcinoma arising from the gallbladder. It is the most common malignant tumour of the gallbladder, typically in the fundus; it is usually well to moderately differentiated. The incidence is higher in patients with gallstones than in patients without gallstones. Signs and symptoms usually present late in the course of the disease and are reminiscent of those of chronic cholecystitis including right upper quadrant pain. Histologic variants include adenocarcinoma of the intestinal type, clear cell adenocarcinoma, mucinous adenocarcinoma, papillary adenocarcinoma, and signet ring adenocarcinoma.

2C13.Y Other specified malignant neoplasm of gallbladder

2C13.Z Malignant neoplasms of gallbladder, unspecified

2C14 Malignant neoplasms of proximal biliary tract, cystic duct

2C14.0 Adenocarcinoma of proximal biliary tract, cystic duct

2C14.1 Mucinous cystic neoplasm with associated invasive carcinoma of cystic duct

2C14.2 Neuroendocrine neoplasms of cystic duct

2C14.Y Other specified malignant neoplasms of biliary tract, cystic duct

2C14.Z Malignant neoplasms of proximal biliary tract, cystic duct, unspecified

2C15 Malignant neoplasms of biliary tract, distal bile duct

2C15.0 **Adenocarcinoma of biliary tract, distal bile duct**

An adenocarcinoma that arises from the common bile duct distal to the insertion of the cystic duct.

2C15.1 **Mucinous cystic neoplasm with associated invasive carcinoma of distal bile duct**

2C15.2 **Neuroendocrine neoplasms of distal bile duct**

2C15.Y **Other specified malignant neoplasms of biliary tract, distal bile duct**

2C15.Z **Malignant neoplasms of biliary tract, distal bile duct, unspecified**

2C16 Malignant neoplasms of ampulla of Vater

2C16.0 **Adenocarcinoma of ampulla of Vater**

A malignant glandular epithelial tumour arising in the ampulla of Vater

2C16.1 **Neuroendocrine neoplasms of ampulla of Vater**

2C16.Y **Other specified malignant neoplasms of ampulla of Vater**

2C16.Z **Malignant neoplasms of ampulla of Vater, unspecified**

2C17 Malignant neoplasms of other or unspecified parts of biliary tract

Exclusions: Malignant neoplasm of intrahepatic bile duct (2C12)

Coded Elsewhere: Malignant mesenchymal tumours of gallbladder or bile ducts (2B5F.2)

2C17.0 **Adenocarcinoma of other or unspecified parts of biliary tract**

2C17.1 **Mucinous cystic neoplasm with associated invasive carcinoma of other or unspecified parts of biliary tract**

2C17.2 **Neuroendocrine neoplasms of other or unspecified parts of biliary tract**

2C17.Y **Other specified malignant neoplasms of overlapping lesion of biliary tract**

2C17.Z **Malignant neoplasms of other or unspecified parts of biliary tract, unspecified**

2C18 Malignant neoplasms of perihilar bile duct

"Includes left, right and common hepatic ducts to the origin of the cystic duct"

2C18.0 **Hilar cholangiocarcinoma**

Klatskin tumour is an extra-hepatic cholangiocarcinoma arising in the junction of the main right or left hepatic ducts to form the common hepatic duct.

2C18.1 **Mucinous cystic neoplasm with associated invasive carcinoma of perihilar bile duct**

2C18.2 **Neuroendocrine neoplasm of perihilar bile duct**

2C18.Y **Other specified malignant neoplasms of perihilar bile duct**

2C18.Z **Malignant neoplasms of perihilar bile duct, unspecified**

2C1Z **Malignant neoplasms of digestive organs, unspecified**

Malignant neoplasms of middle ear, respiratory or intrathoracic organs (2C20-2C2Z)

Exclusions: Mesotheliomas of peritoneum (2C51.2)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C20 **Malignant neoplasms of nasal cavity**

From the chapter on Nasal Cavity (H&N BB) Although the nasal cavity and paranasal sinuses occupy a relatively small anatomical space, they are the site of origin of some of the more complex, histologically diverse group of tumours in the entire human body. These include neoplasms derived from mucosal epithelium, seromucinous glands, soft tissues, bone, cartilage, neural/neuroectodermal tissue, haematolymphoid cells and the odontogenic apparatus. Many of the tumours are similar to those found elsewhere in the body but a few, such as the olfactory neuroblastoma, are unique to this site.

Exclusions: Malignant neoplasm of nose NOS (2C29)

Malignant neoplasm of olfactory bulb (2A02)

Malignant neoplasm of posterior margin of nasal septum and choana (2B6B)

Malignant neoplasm of skin of nose (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C20.0 Adenocarcinoma of nasal cavity

2C20.1 Malignant neuroepitheliomatous neoplasm of nasal cavity

2C20.2 Melanoma of nasal cavity

2C20.3 Olfactory neuroblastoma

2C20.4 Squamous cell carcinoma of nasal cavity

2C20.Y Other specified malignant neoplasm of nasal cavity

2C20.Z Malignant neoplasms of nasal cavity, unspecified

2C21 **Malignant neoplasms of middle ear**

Malignant neoplasm originating in the middle ear.

Exclusions: malignant neoplasm of skin of (external) ear (2C30-2C3Z)

malignant neoplasm of bone of ear (meatus) (2B50-2B5Z)

malignant neoplasm of cartilage of ear (2B50-2B5Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C21.0 Adenocarcinoma of middle ear

2C21.1 Squamous cell carcinoma of middle ear

2C21.2 **Unspecified malignant epithelial neoplasm of middle ear**

2C21.Y **Other specified malignant neoplasm of middle ear**

2C21.Z **Malignant neoplasms of middle ear, unspecified**

2C22 Malignant neoplasms of accessory sinuses

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C22.0 **Adenocarcinoma of accessory sinuses**

2C22.1 **Squamous cell carcinoma of accessory sinuses**

2C22.10 Squamous cell carcinoma of sphenoidal sinus

2C22.1Y Squamous cell carcinoma of other specified accessory sinuses

2C22.2 **Malignant epithelial neoplasms of accessory sinuses, unspecified type**

2C22.3 **Melanomas of accessory sinuses**

2C22.Y **Other specified malignant neoplasms of accessory sinuses**

2C22.Z **Malignant neoplasms of accessory sinuses, unspecified**

2C23 Malignant neoplasms of larynx

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C23.1 **Malignant neoplasms of glottis of larynx**

2C23.10 Squamous cell carcinoma of larynx, glottis

A squamous cell carcinoma of the larynx that arises from the glottic area. It may remain localised for a long period then in late disease stage, it may spread to the opposite true vocal cord, supraglottic and subglottic areas, and the soft tissues of the neck. Hoarseness is the presenting symptom.

2C23.1Y Other specified malignant neoplasms of larynx, glottis

2C23.2 **Malignant neoplasms of supraglottis of larynx**

Exclusions: Malignant neoplasm of anterior surface of epiglottis (2B6A)

2C23.20 Squamous cell carcinoma of larynx, supraglottis

A squamous cell carcinoma of the larynx that arises from the supraglottic area. Signs and symptoms include dysphagia, a sensation of foreign body in the throat, and hemoptysis. It spreads to the space anterior to the epiglottis, pyriform sinus, and base of the tongue.

2C23.2Y Other specified malignant neoplasms of larynx, supraglottis

2C23.3 **Malignant neoplasms of subglottis of larynx**

A primary or metastatic malignant neoplasm involving the subglottis.

2C23.30 Squamous cell carcinoma of larynx, subglottis

A squamous cell carcinoma of the larynx that arises from the subglottic area. Symptoms include dyspnea and stridor. It spreads to the hypopharynx, trachea, and thyroid gland.

2C23.31 Adenocarcinoma of larynx, subglottis

2C23.3Y Other specified malignant neoplasms of larynx, subglottis

2C23.4 Malignant neoplasm of laryngeal cartilage

2C23.5 Malignant neoplasm of overlapping lesion of larynx

2C23.Z Malignant neoplasms of larynx, unspecified

2C24 Malignant neoplasms of trachea

A primary or metastatic malignant neoplasm involving the trachea

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

trachea carina cancer (2C25)

2C24.0 Adenocarcinoma of trachea

2C24.1 Squamous cell carcinoma of trachea

2C24.2 Malignant epithelial neoplasms of trachea, unspecified type

2C24.Y Other specified malignant neoplasms of trachea

2C24.Z Malignant neoplasms of trachea, unspecified

2C25 Malignant neoplasms of bronchus or lung

A primary or metastatic malignant neoplasm involving the lung.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C25.0 Adenocarcinoma of bronchus or lung

A carcinoma that arises from the lung and is characterised by the presence of malignant glandular epithelial cells. There is a male predilection with a male to female ratio of 2:1. Usually lung adenocarcinoma is asymptomatic and is identified through screening studies or as an incidental radiologic finding. If clinical symptoms are present they include shortness of breath, cough, hemoptysis, chest pain, and fever. Tobacco smoke is a known risk factor.

2C25.1 Small cell carcinoma of bronchus or lung

A highly aggressive subtype of lung carcinoma characterised by the presence of malignant small cells and necrosis. Metastatic disease is usually present at the time of diagnosis.

2C25.2 **Squamous cell carcinoma of bronchus or lung**

A carcinoma arising from malignant squamous bronchial epithelial cells and characterised by the presence of keratinization and/or intercellular bridges. Cigarette smoking and arsenic exposure are strongly associated with squamous cell lung carcinoma.

2C25.3 **Large cell carcinoma of bronchus or lung**

2C25.4 **Carcinoid or other malignant neuroendocrine neoplasms of bronchus or lung**

2C25.5 **Unspecified malignant epithelial neoplasm of bronchus or lung**

2C25.Y **Other specified malignant neoplasms of bronchus or lung**

2C25.Z **Malignant neoplasms of bronchus or lung, unspecified**

2C26 Malignant neoplasms of the pleura

A primary or metastatic malignant neoplasm affecting the pleura. A representative example of primary malignant pleural neoplasm is the malignant pleural mesothelioma. A representative example of metastatic malignant neoplasm to the pleura is when a metastatic carcinoma has spread to the pleura from another anatomic site.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C26.0 **Mesothelioma of pleura**

Malignant mesothelioma is a fatal asbestos-associated malignancy arising in the lining cells (mesothelium) of the pleural and peritoneal cavities, as well as in the pericardium and the tunica vaginalis.

2C26.Y **Other specified malignant neoplasms of the pleura**

2C26.Z **Malignant neoplasms of the pleura, unspecified**

2C27 Malignant neoplasms of thymus

Primary malignant neoplasm involving the thymus. This category includes malignant thymomas, primary thymic carcinomas and carcinoid tumour or other neuroendocrine neoplasms of thymus.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C27.0 **Carcinoma of thymus**

A diverse group of carcinomas of the thymus gland, previously known as thymoma type C. It includes morphologic variants derived from purely epithelial cells, as well as from cells with neuroendocrine differentiation.

2C27.1 **Carcinoid tumour or other neuroendocrine neoplasms of thymus**

Thymic neuroendocrine carcinoma is a type of thymic epithelial neoplasm displaying evidence of neuroendocrine differentiation.

2C27.2 **Malignant thymoma**

A thymoma that has an aggressive clinical course (capsular invasion, infiltration of the surrounding tissues) and can metastasize. Although any morphologic subtype of thymoma may eventually have a malignant clinical course, this term is most often associated with thymoma types B3 and C.

2C27.Y **Other specified malignant neoplasms of thymus**

2C27.Z **Malignant neoplasms of thymus, unspecified**

2C28 Malignant neoplasms of heart, mediastinum or non-mesothelioma of pleura

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C28.0 **Malignant germ cell neoplasms of heart, mediastinum or non-mesothelioma of pleura**

2C28.1 **Other specified malignant neoplasms of heart, mediastinum or non-mesothelioma of pleura**

2C28.Z **Malignant neoplasms of heart, mediastinum or non-mesothelioma of pleura, unspecified**

2C29 Malignant neoplasms of other or ill-defined sites in the respiratory system or intrathoracic organs

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C29.0 **Squamous cell carcinomas of other and ill-defined sites in the respiratory system and intrathoracic organs**

2C29.1 **Other specified malignant neoplasms of other or ill-defined sites in the respiratory system or intrathoracic organs**

2C29.Z **Malignant neoplasms of other or ill-defined sites in the respiratory system or intrathoracic organs, unspecified**

2C2Y Other specified malignant neoplasms of middle ear, respiratory or intrathoracic organs

2C2Z Malignant neoplasms of middle ear, respiratory or intrathoracic organs, unspecified

Malignant neoplasms of skin (2C30-2C3Z)

A primary or metastatic tumour involving the skin. Primary malignant skin tumours most often are carcinomas (either basal cell or squamous cell carcinomas that arise from cells in the epidermis) or melanomas that arise from pigment-containing skin melanocytes. Metastatic tumours to the skin include carcinomas and lymphomas.

Exclusions: Carcinoma in situ of skin (2E64)

Metastatic malignant neoplasm involving skin (2E08)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C30 Melanoma of skin

A primary melanoma arising from atypical melanocytes in the skin. Precursor lesions include acquired and congenital melanocytic nevi, and dysplastic nevi. Several histologic variants have been recognised, including superficial spreading melanoma, acral lentiginous melanoma, nodular melanoma, and lentigo maligna melanoma.

Exclusions: Melanoma of penis (2C81.1)

Melanoma of vulva (2C70.1)

2C30.0 Superficial spreading melanoma, primary

The commonest form of melanoma, superficial spreading malignant melanoma accounts for about 70 per cent of all melanomas. It characteristically presents as an asymptomatic pigmented cutaneous macule which is asymmetrical in shape and displays variability in both hue and pigment intensity. It has a relatively long phase of progressive superficial extension (radial growth) before penetrating deeper into the dermis and entering an invasive vertical growth phase.

2C30.1 Nodular melanoma, primary

Variant of melanoma carrying a poor prognosis due to the fact that there is little or no prodromal radial (superficial) growth phase before deep invasion (vertical growth). The lesion presents as an elevated, reddish, bluish or dark brown coloured, dome- shaped tumour. Ulceration or bleeding from the lesion occurs frequently. It occurs most frequently in the fifth or sixth decade.

2C30.2 Lentigo maligna melanoma, primary

Lentigo maligna malignant melanoma is a form of melanoma which occurs within a lentigo maligna when neoplastic cells no longer remain confined to the epidermis (in situ radial growth) but invade the dermis (vertical growth). The lentigo maligna from which it arises may have been present as an irregularly pigmented macule on sun-exposed skin for many years before dermal invasion supervenes. Clinical differentiation from lentigo maligna may not be possible in the early stages of invasion but as the tumour progresses a focal thickening or nodule within the lentigo maligna will become apparent.

Exclusions: Lentigo maligna (2E63.00)

2C30.3 **Acral lentiginous melanoma, primary**

Acral lentiginous malignant melanoma is a distinct and uncommon form of melanoma affecting either palmar and plantar skin or the nail apparatus. It is usually preceded by a slowly progressive in situ phase which may be overlooked. It typically presents either as an enlarging area of macular pigmentation on the palms and soles or as a longitudinal pigmented band within the nail plate. More aggressive tumours present as ulcerated nodules which, when involving the nail apparatus, can destroy the nail plate. Acral lentiginous malignant melanoma accounts for a high proportion of melanomas seen in dark-skinned people.

2C30.Y **Other specified melanoma of skin**

2C30.Z **Melanoma of skin, unspecified**

2C31 Squamous cell carcinoma of skin

A carcinoma arising from the squamous cells of the epidermis. Skin squamous cell carcinoma is most commonly found on sun-exposed areas. The majority of the tumours are well-differentiated.

Coded Elsewhere: Squamous cell carcinoma of penis (2C81.0)

2C31.0 **Verrucous squamous cell carcinoma of skin**

Verrucous squamous cell carcinoma is a rare variant of well-differentiated squamous cell carcinoma with low malignant potential. It occurs principally on the glans and prepuce of the penis and on the sole of the foot.

Exclusions: Verrucous squamous cell carcinoma of vulva (2C70.2)

2C31.1 **Keratoacanthoma**

Keratoacanthoma is a relatively common keratinocytic epidermal tumour which shows resemblances to squamous cell carcinoma of the skin, from which it may be difficult to distinguish either clinically or histopathologically. It is characterised by rapid growth over a few weeks to months, followed by spontaneous resolution over 4-6 months. Because it is not possible to predict its benign behaviour with complete certainty during its initial growth phase, the designation "Well-differentiated squamous cell carcinoma (keratoacanthoma type)" is also used.

2C31.Z **Cutaneous squamous cell carcinoma**

2C32 Basal cell carcinoma of skin

Basal cell carcinoma or BCC is the most common malignancy in humans. It is believed that BCCs arise from pluripotential cells in the basal layer of the epidermis or, less commonly, hair follicle. BCCs typically occur in areas of chronic sun exposure and presents as slowly enlarging reddish papules, plaques or nodules on the head and neck, although the superficial variant is often located on the trunk. BCCs frequently ulcerate and become crusted. Although they rarely metastasize, they can cause significant local destruction and disfigurement if neglected or inadequately treated, particularly if of the sclerosing or infiltrative subtype.

2C32.0 Nodular basal cell carcinoma of skin

This is the most common form of basal cell carcinoma and is typically located on the head or neck. It starts as a small translucent nodule which will frequently necrose and ulcerate as it enlarges. Telangiectatic blood vessels can often be detected just under the tumour surface. A minority may be pigmented and give rise to difficulty in distinguishing them from melanoma.

2C32.1 Sclerosing basal cell carcinoma of skin

This form of basal cell carcinoma is composed of thin strands, cords and columns of malignant cells which infiltrate between collagen bundles of the dermis. It may infiltrate widely and deeply before it becomes clinically obvious. It typically starts as a pale, poorly-defined indurated plaque which may not come to medical attention until it starts to bleed and crust.

2C32.2 Superficial basal cell carcinoma of skin

Superficial basal cell carcinomas are often multiple and appear as pink or red barely elevated patches varying in size from a few mm to over 10 cm in diameter. A fine pearly border can usually be seen on careful inspection. They occur most frequently on the trunk.

2C32.Y Other specified basal cell carcinoma of skin

2C32.Z Basal cell carcinoma of skin, unspecified

2C33 Adnexal carcinoma of skin

A carcinoma arising from the sebaceous glands, sweat glands, or the hair follicles. Representative examples include sebaceous carcinoma, apocrine carcinoma, eccrine carcinoma, and pilomatrical carcinoma.

Inclusions: Primary cutaneous mucinous carcinoma
Primary cutaneous adenoid cystic carcinoma
Appendageal carcinoma of skin

2C34 Cutaneous neuroendocrine carcinoma

Cutaneous neuroendocrine carcinoma is a primary cutaneous cancer arising from a subset of skin neuroendocrine cells (Merkel cells, giving the name Merkel cell carcinoma (MCC)).

2C35 Cutaneous sarcoma

A group of generally rare malignant neoplasms arising from mesenchymal elements in the dermis including fibroblasts, pilar smooth muscle and vascular endothelium.

Coded Elsewhere: Angiosarcoma of skin (2B56.1)
Kaposi sarcoma of skin (2B57.1)
Cutaneous leiomyosarcoma (2B58.Y)
Dermatofibrosarcoma protuberans (2B53.Y)

2C3Y Other specified malignant neoplasms of skin

2C3Z Malignant neoplasm of skin of unknown or unspecified type

Malignant neoplasms of peripheral nerves or autonomic nervous system (2C40-2C4Z)

Exclusions: Malignant nerve sheath tumour of peripheral nerves or autonomic nervous system, primary site (2B5E)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C40 **Malignant neuroepitheliomatous neoplasms of peripheral nerves or autonomic nervous system**

2C41 **Malignant perineurioma**

2C4Y **Other specified malignant neoplasms of peripheral nerves and autonomic nervous system**

2C4Z **Malignant neoplasms of peripheral nerves or autonomic nervous system, unspecified**

Malignant neoplasms of retroperitoneum, peritoneum or omentum (2C50-2C5Z)

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C50 **Malignant neoplasms of retroperitoneum**

A primary or metastatic malignant neoplasm involving the retroperitoneum. The vast majority of cases are carcinomas, lymphomas, or sarcomas.

Exclusions: Malignant neoplasms of omentum (2C52)

Malignant neoplasms of peritoneum (2C51)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C50.0 Cystic, mucinous or serous carcinoma of retroperitoneum

2C50.Y Other specified malignant neoplasms of retroperitoneum

2C50.Z Malignant neoplasms of retroperitoneum, unspecified

2C51 **Malignant neoplasms of peritoneum**

Exclusions: Malignant neoplasms of retroperitoneum (2C50)

Malignant neoplasms of omentum (2C52)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C51.0 Adenocarcinomas of peritoneum

2C51.1 Cystic, mucinous or serous carcinoma of peritoneum

2C51.2 Mesotheliomas of peritoneum

A benign or malignant mesothelial neoplasm that arises from the peritoneum.

2C51.20 Mesothelioma of mesocolon

2C51.21 Mesothelioma of mesentery

2C51.2Y Mesotheliomas of other specified sites of peritoneum

2C51.2Z Mesotheliomas of peritoneum, site unspecified

2C51.Y **Other specified malignant neoplasms of peritoneum**

2C51.Z **Malignant neoplasms of peritoneum, unspecified**

2C52 **Malignant neoplasms of omentum**

Exclusions: Malignant neoplasms of retroperitoneum (2C50)
Malignant neoplasms of peritoneum (2C51)
Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Myosarcomas of omentum (2B5F.10)

2C52.0 **Cystic, mucinous or serous carcinoma of omentum**

2C52.Y **Other specified malignant neoplasms of omentum**

2C52.Z **Malignant neoplasms of omentum, unspecified**

2C53 **Malignant neoplasm involving overlapping sites of retroperitoneum, peritoneum or omentum**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C53.0 **Adenocarcinoma involving overlapping sites of retroperitoneum, peritoneum or omentum**

2C53.1 **Mesothelioma involving overlapping sites of retroperitoneum, peritoneum or omentum**

2C53.Y **Other specified malignant neoplasm involving overlapping sites of retroperitoneum, peritoneum or omentum**

2C53.Z **Malignant neoplasm involving overlapping sites of retroperitoneum, peritoneum or omentum, unspecified**

2C5Y **Other specified malignant neoplasms of retroperitoneum, peritoneum or omentum**

2C5Z **Malignant neoplasms of retroperitoneum, peritoneum or omentum, unspecified**

Malignant neoplasms of breast (2C60-2C6Z)

The category refers to primary malignant neoplasms of parenchyma, connective, and soft tissue of the breast, including nipple and areola.

Inclusions: malignant neoplasm of connective tissue of breast

CA - [carcinoma] of breast

breast carcinoma NOS

Exclusions: Malignant neoplasm of skin of breast (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C60 **Carcinoma of breast, specialised type**

2C61 **Invasive carcinoma of breast**

2C61.0 Invasive ductal carcinoma of breast

2C61.1 Invasive lobular carcinoma of breast

An infiltrating lobular adenocarcinoma. The malignant cells lack cohesion and are arranged individually or in a linear manner (Indian files), or as narrow trabeculae within the stroma. The malignant cells are usually smaller than those of ductal carcinoma, are less pleomorphic, and have fewer mitotic figures.

2C61.2 Invasive pleomorphic lobular carcinoma of breast

A grade II invasive lobular carcinoma of the breast, characterised by the presence of neoplastic cells with large and atypical nuclei.

2C61.3 Invasive carcinoma of breast with mixed ductal and lobular features

An invasive ductal breast carcinoma associated with a lobular carcinomatous component. The lobular carcinomatous component may be in situ or invasive.

2C61.4 Invasive carcinoma of breast, unidentifiable type

A carcinoma that infiltrates the breast parenchyma and where the histopathological type could not be identified.

2C62 **Inflammatory carcinoma of breast**

An advanced, invasive breast adenocarcinoma characterised by the presence of distinct changes in the overlying skin. These changes include diffuse erythema, edema, peau d'orange (skin of an orange) appearance, tenderness, induration, warmth, enlargement, and in some cases a palpable mass. The skin changes are the consequence of lymphatic obstruction from the underlying invasive breast adenocarcinoma. Microscopically, the dermal lymphatics show prominent infiltration by malignant cells. The invasive breast adenocarcinoma is usually of ductal, NOS type. There is not significant inflammatory cell infiltrate present, despite the name of this carcinoma.

2C63 **Malignant phyllodes tumour of breast**

A phyllodes tumour of the breast characterised by infiltrative margins and a sarcomatous stromal component. The sarcomatous stroma usually displays features of fibrosarcoma. Liposarcomatous, osteosarcomatous, or rhabdomyosarcomatous elements may also be present.

2C64 **Solid papillary carcinoma of breast with evidence of invasion**

2C65 **Hereditary breast and ovarian cancer syndrome**

2C6Y **Other specified malignant neoplasms of breast**

2C6Z **Malignant neoplasms of breast, unspecified**

Malignant neoplasms of female genital organs (2C70-2C7Z)

A primary or metastatic malignant neoplasm involving the female reproductive system. Representative examples include endometrial carcinoma, cervical carcinoma, ovarian carcinoma, uterine corpus leiomyosarcoma, adenosarcoma, malignant mixed mesodermal (mullerian) tumour, and gestational choriocarcinoma.

Coding Note: Includes Malignant neoplasm of skin of female genital organs

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C70 **Malignant neoplasms of vulva**

Squamous cell carcinoma of the vulva occurs predominantly in the older age group. Although the incidence rate of vulvar intraepithelial neoplasia is increasing, that of squamous cell carcinoma of the vulva is declining, reflecting earlier detection and more successful treatment. In addition to human papillomavirus infection, cigarette smoking is a putative risk factor for vulvar squamous cell carcinoma. There are three known precursor lesions: vulvar intraepithelial neoplasia, lichen sclerosis and chronic granulomatous disease. Other important epithelial malignancies of the vulva are Paget disease and Bartholin gland carcinoma. They are much less

common than squamous lesions, and the risk factors are largely unknown. Prominent non-epithelial tumours are malignant melanoma and sarcoma botyoides.

Coding Note: Includes skin of vulva.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C70.0 Basal cell carcinoma of vulva

A slow growing, locally infiltrating carcinoma that arises from the vulva. It is characterised by the presence of malignant cells that resemble the basal cells that are present in the epidermis.

2C70.1 Melanoma of vulva

2C70.2 Squamous cell carcinoma of vulva

An invasive squamous cell carcinoma arising from the vulva. Risk factors include the human papilloma virus and cigarette smoking. Precursor lesions include the vulvar intraepithelial neoplasia, lichen sclerosus with associated squamous cell hyperplasia, and chronic granulomatous vulvar disease such as granuloma inguinale. Symptoms include vulvar pruritus or irritation, discharge, bleeding, and pain. The following morphologic variants have been identified: keratinizing, non-keratinizing, basaloid, warty, verrucous, keratoacanthoma-like, and squamous cell carcinoma with tumour giant cells. Risk factors for recurrence include advanced stage, tumour diameter greater than 2.5 cm, multifocality, capillary-like space involvement, associated vulvar intraepithelial neoplasia grades 2 or 3, and margins of resection involved by tumour.

Coded Elsewhere: Verrucous squamous cell carcinoma of vulva (2C31.0)

2C70.Y Other specified malignant neoplasms of vulva

Coding Note: Includes skin of vulva.

2C70.Z Malignant neoplasms of vulva, unspecified

Coding Note: Includes skin of vulva.

2C71 Malignant neoplasms of vagina

A primary or metastatic malignant tumour involving the vagina. Representative examples include carcinomas and sarcomas.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C71.0 Adenocarcinoma of vagina

An adenocarcinoma arising from the vagina. Morphologic variants include the clear cell, endometrioid, mesonephric, and mucinous adenocarcinoma.

2C71.1 Melanoma of vagina

A primary malignant neoplasm of the vagina composed of malignant melanocytes.

2C71.2 Squamous cell carcinoma of vagina

A squamous cell carcinoma arising from the vagina. Human papillomavirus infection is associated with the development of vaginal intraepithelial neoplasia and invasive squamous cell carcinoma. Signs and symptoms include painless bleeding, postcoital bleeding, and urinary tract symptoms. Morphologically it resembles squamous cell carcinomas in other anatomic sites.

2C71.Y Other specified malignant neoplasms of vagina

2C71.Z Malignant neoplasms of vagina, unspecified

2C72 Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C72.0 Adenocarcinoma of uterine ligament, parametrium, or uterine adnexa

2C72.1 **Mucinous or serous carcinoma of uterine ligament, parametrium, or uterine adnexa**

2C72.3 **Carcinosarcomas of uterine ligament, parametrium, or uterine adnexa**

2C72.Y **Other specified malignant neoplasms of uterine ligament, parametrium, and uterine adnexa**

2C72.Z **Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa, unspecified**

2C73 Malignant neoplasms of ovary

A primary or metastatic malignant neoplasm involving the ovary. Most primary malignant ovarian neoplasms are either carcinomas (serous, mucinous, or endometrioid adenocarcinomas) or malignant germ cell tumours. Metastatic malignant neoplasms to the ovary include carcinomas, lymphomas, and melanomas.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Hereditary breast and ovarian cancer syndrome (2C65)

2C73.0 **Carcinomas of ovary**

2C73.00 Clear cell adenocarcinoma of ovary

A malignant glandular epithelial tumour characterised by the presence of clear and hobnail cells. The tumour is highly associated with ovarian endometriosis, pelvic endometriosis and paraendocrine hypercalcemia.

2C73.01 Endometrioid adenocarcinoma of ovary

An endometrioid adenocarcinoma arising from the ovary. It comprises 10% to 25% of all primary ovarian carcinomas. Grossly, endometrioid carcinoma may present as a cystic or solid mass. Microscopically, the tumour greatly resembles the appearance of the ordinary type of endometrial adenocarcinoma. As a group, endometrioid carcinoma has a prognosis twice as good as that of serous or mucinous carcinoma.

2C73.02 Low grade serous adenocarcinoma of ovary

A slow-growing serous adenocarcinoma that arises from the ovary. It usually originates from borderline neoplastic processes or adenofibromas. It is characterised by the presence of low grade cytologic features and infrequent mitotic figures.

2C73.03 High grade serous adenocarcinoma of ovary

2C73.04 Mucinous adenocarcinoma of ovary

An invasive adenocarcinoma that arises from the ovary and is characterised by the presence of malignant epithelial cells that contain intracytoplasmic mucin. There is cellular atypia, increased layering of cells, complexity of glands, and papillary formations.

2C73.0Y Other specified carcinomas of ovary

2C73.0Z Carcinomas of ovary, unspecified

2C73.1 Dysgerminoma of ovary

A malignant germ cell tumour arising from the ovary. Morphologically, it is identical to seminoma and consists of a monotonous population of germ cells with abundant pale cytoplasm and uniform nuclei. The stroma invariably contains chronic inflammatory cells, mostly T-lymphocytes. It responds to chemotherapy or radiotherapy and the prognosis relates to the tumour stage.

Inclusions: Malignant dysgerminomatous germ cell tumour of ovary

2C73.2 Granulosa cell malignant tumour of ovary

An aggressive granulosa cell tumour that arises from the ovary and metastasizes to other anatomic sites.

2C73.3 Malignant teratoma of ovary

A malignant germ cell tumour arising from the ovary. It usually affects females in their first two decades of life. It contains variable amounts of immature embryonal tissues. Based on the amount of immature neuroepithelial component, immature teratomas are graded from 1 to 3. The stage and grade of the tumour and the grade of the metastatic tumour are the important factors that predict prognosis. The use of cisplatin-based combination chemotherapy has significantly improved the survival rates of the patients.

Coded Elsewhere: Struma ovarii (5A02.Y)

2C73.4 Serous cystadenoma, borderline malignancy of ovary

2C73.5 Endodermal sinus tumour, unspecified site, female

2C73.Y Other specified malignant neoplasms of the ovary

2C73.Z Malignant neoplasms of ovary, unspecified

2C74 Malignant neoplasms of fallopian tube

Tumours of the fallopian tube are much less common than the corresponding ovarian neoplasms; however, histologically the same surface epithelial-stromal tumour subtypes are recognised. Sex cord-stromal and germ cell tumours are rare. Hydatidiform moles and gestational choriocarcinoma are uncommon complications of tubal ectopic pregnancy. The wolffian adnexal tumour is also infrequent and typically occurs in the leaves of the broad ligament. The risk factors appear similar to those of the ovary. Fallopian tube carcinomas are a component of the hereditary breast-ovarian cancer syndrome caused by BRCA1 and BRCA2 germline mutations.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C74.0 Adenocarcinoma of fallopian tube

An adenocarcinoma that arises from the fallopian tube. Histologic subtypes include clear cell, endometrioid, serous, and mucinous adenocarcinoma. It spreads to adjacent organs, regional lymph nodes, and peritoneum.

2C74.Y Other specified malignant neoplasms of fallopian tube

2C74.Z Malignant neoplasms of fallopian tube, unspecified

2C75 Malignant neoplasms of placenta

Exclusions: hydatidiform mole, NOS (JA02)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C75.0 Malignant trophoblastic neoplasms of placenta

A diverse group of pregnancy-related tumours characterised by excessive proliferation of trophoblasts. Representative examples include hydatidiform mole, gestational choriocarcinoma, and placental site trophoblastic tumour.

2C75.Y Other specified malignant neoplasms of placenta

2C75.Z Malignant neoplasms of placenta, unspecified

2C76 Malignant neoplasms of corpus uteri

A malignant neoplasm that affects the uterine corpus. Representative examples include endometrial carcinoma, carcinosarcoma, leiomyosarcoma, and adenosarcoma.

Exclusions: Endometrial stromal sarcoma, primary site (2B5C)

2C76.0 Endometrial endometrioid adenocarcinoma

2C76.1 Endometrial mucinous adenocarcinoma

2C76.2 Endometrial clear cell adenocarcinoma

2C76.3 Endometrial serous adenocarcinoma

2C76.4 Endometrial mixed adenocarcinoma

2C76.40 Endometrial squamous cell carcinoma

2C76.41 Endometrial small cell carcinoma

2C76.42 Endometrial undifferentiated carcinoma

2C76.43 Carcinosarcoma of uterus

2C76.Y Other specified malignant neoplasms of corpus uteri

2C76.Z Malignant neoplasms of corpus uteri, unspecified

2C77 Malignant neoplasms of cervix uteri

Primary or metastatic malignant neoplasm involving the cervix.

2C77.0 Squamous cell carcinoma of cervix uteri

A squamous cell carcinoma arising from the cervical epithelium. It usually evolves from a precancerous cervical lesion. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors for cervical squamous cell carcinoma. The following histologic patterns have been described: Conventional squamous cell carcinoma, papillary squamous cell carcinoma, transitional cell carcinoma, lymphoepithelioma-like carcinoma, verrucous carcinoma, condylomatous carcinoma and spindle cell carcinoma. Survival is most closely related to the stage of disease at the time of diagnosis.

2C77.1 Adenocarcinoma of cervix uteri

An adenocarcinoma arising from the cervical epithelium. It accounts for approximately 15% of invasive cervical carcinomas. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors. Grossly, advanced cervical adenocarcinoma may present as an exophytic mass, an ulcerated lesion, or diffuse cervical enlargement. Microscopically, the majority of cervical adenocarcinomas are of the endocervical (mucinous) type.

2C77.2 Adenosquamous carcinoma of cervix uteri

2C77.3 Neuroendocrine carcinoma of cervix uteri

2C77.Y Other specified malignant neoplasms of cervix uteri

2C77.Z Malignant neoplasms of cervix uteri, unspecified

2C78 Malignant neoplasms of uterus, part not specified

2C79 Malignant neoplasm involving overlapping sites of female genital organs

Inclusions: Malignant neoplasm of female genital organs whose point of origin cannot be classified to any other existing entity

2C7Y Other specified malignant neoplasms of female genital organs

Coding Note: Includes Malignant neoplasm of skin of female genital organs

2C7Z Malignant neoplasms of female genital organs, unspecified

Coding Note: Includes Malignant neoplasm of skin of female genital organs

Malignant neoplasms of male genital organs (2C80-2C8Z)

A primary or metastatic malignant neoplasm involving the male reproductive system. Representative examples include prostate carcinoma, penile carcinoma, testicular seminoma, and testicular embryonal carcinoma.

Coding Note: Includes malignant neoplasm of skin of male genital organs

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C80 Malignant neoplasms of testis

A primary or metastatic malignant neoplasm that affects the testis. Representative examples include seminoma, embryonal carcinoma, sarcoma, leukaemia, and lymphoma.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C80.2 Germ cell tumour of testis

A germ cell tumour arising from the testis. Representative examples include teratoma, seminoma, embryonal carcinoma, and yolk sac tumour.

2C80.Y Other specified malignant neoplasms of testis

2C80.Z Malignant neoplasms of testis, unspecified

2C81 Malignant neoplasms of penis

A primary or metastatic malignant neoplasm that affects the penis. Representative examples include penile carcinoma and penile sarcoma.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Verrucous squamous cell carcinoma of penis (2C31.0)

2C81.0 Squamous cell carcinoma of penis

A squamous cell carcinoma arising from the penis. It occurs chiefly in the squamous epithelium of the glans, coronal sulcus, and foreskin. Etiologic factors include phimosis, lichen sclerosus, smoking, ultraviolet irradiation, history of warts or condylomas, and lack of circumcision. Human papilloma virus is present in a subset of penile squamous cell carcinomas. Patients may present with an exophytic or flat ulcerative mass in the glans or a large primary tumour with inguinal nodal and skin metastases. Morphologic variants include the basaloid carcinoma, warty (condylomatous) carcinoma, verrucous carcinoma, and sarcomatoid (spindle cell) carcinoma.

Coded Elsewhere: Verrucous squamous cell carcinoma of penis (2C31.0)

2C81.1 Melanoma of penis

Inclusions: Melanoma of skin of penis

Melanoma of mucocutaneous epithelium of penis

2C81.Y Other specified malignant neoplasm of penis

2C81.Z Malignant neoplasms of penis, unspecified

2C82 Malignant neoplasms of prostate

Prostate cancer contributes significantly to the overall cancer burden, being the most frequent malignant neoplasia in men. The number of cases has continuously increased over the past decades, partly due to the higher life expectancy. An additional factor is the Western lifestyle, characterised by a highly caloric diet and lack of physical exercise. Epidemiological data indicates that black people are most susceptible, followed by white people, while Asian people have the lowest risk. The extent to which prostate cancer mortality can be reduced by PSA screening, is currently being evaluated. Histopathological diagnosis and grading play a major role in the management of prostate cancer

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C82.0 Adenocarcinoma of prostate

An adenocarcinoma arising from the prostate gland. It is one of the most common malignant tumours afflicting men. The majority of adenocarcinomas arise in the peripheral zone and a minority occurs in the central or the transitional zone of the prostate gland. Grading of prostatic adenocarcinoma predicts disease progression and correlates with survival. Several grading systems have been proposed, of which the Gleason system is the most commonly used. Gleason sums of 2 to 4 represent well-differentiated disease, 5 to 7 moderately differentiated disease and 8 to 10 poorly differentiated disease. Prostatic-specific antigen (PSA) serum test is widely used as a screening test for the early detection of prostatic adenocarcinoma.

2C82.Y **Other specified malignant neoplasms of prostate**

2C82.Z **Malignant neoplasms of prostate, unspecified**

2C83 **Malignant neoplasms of scrotum**

Inclusions: malignant neoplasm of skin of scrotum

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C83.0 **Squamous cell carcinoma of scrotum**

2C83.Y **Other specified malignant neoplasms of scrotum**

2C83.Z **Malignant neoplasms of scrotum, unspecified**

2C84 **Malignant neoplasms of other specified male genital organs**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C8Z **Malignant neoplasms of male genital organs, unspecified**

Coding Note: Includes malignant neoplasm of skin of male genital organs

Malignant neoplasms of urinary tract (2C90-2C9Z)

A primary or metastatic malignant tumour involving the urinary system. Common tumour types include carcinomas, lymphomas, and sarcomas.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C90 **Malignant neoplasms of kidney, except renal pelvis**

Cancer of the kidney amounts to 2% of the total human cancer burden, with approximately 190,000 new cases diagnosed each year. They occur in all world regions, with a preference for developed countries. Etiological factors include environmental carcinogens (tobacco smoking) and lifestyle factors, in particular obesity. Although renal tumours can be completely removed surgically, haematogeneous metastasis is frequent and may occur already at an early stage of the disease. The pattern of somatic mutations in kidney tumours has been extensively investigated and has become, in addition to histopathology, a major criterion for classification. Kidney tumours also occur in the setting of several inherited cancer syndromes, including von Hippel-Lindau disease.

Exclusions: Malignant neoplasm of renal calyces (2C91)

Malignant neoplasms of renal pelvis (2C91)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C90.0 **Renal cell carcinoma of kidney, except renal pelvis**

A carcinoma arising from the renal parenchyma. The incidence of renal cell carcinoma has increased by 35% from 1973 to 1991. There is a strong correlation between cigarette smoking and the development of renal cell carcinoma. The clinical presentation includes : haematuria, flank pain and a palpable lumbar mass. A high percentage of renal cell carcinomas are diagnosed when an ultrasound is performed for other purposes. Diagnostic procedures include: ultra sound, intravenous pyelography and computed tomography (CT).

2C90.Y **Other specified malignant neoplasms of kidney, except renal pelvis**

2C90.Z **Malignant neoplasms of kidney, except renal pelvis, unspecified**

2C91 **Malignant neoplasms of renal pelvis**

Abnormal malignant growth of the cells within the renal pelvis.

Inclusions: malignant neoplasm of pelviureteric junction

malignant neoplasm of renal calyces

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C91.0 **Urothelial carcinoma of renal pelvis**

2C91.Y **Other specified malignant neoplasms of renal pelvis**

2C91.Z **Malignant neoplasms of renal pelvis, unspecified**

2C92 **Malignant neoplasms of ureter**

A primary or metastatic malignant tumour involving the ureter. The majority are carcinomas.

Exclusions: malignant neoplasm of ureteric orifice of bladder (2C94)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2C92.0 **Urothelial carcinoma of ureter**

2C92.Y **Other specified malignant neoplasms of ureter**

2C92.Z **Malignant neoplasms of ureter, unspecified**

2C93 **Malignant neoplasms of urethra or paraurethral gland**

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C93.0 **Adenocarcinoma of urethra or paraurethral gland**

2C93.1 **Squamous cell carcinoma of urethra or paraurethral gland**

2C93.2 **Urothelial carcinoma of urethra or paraurethral gland**

2C93.Y **Other specified malignant neoplasms of urethra and paraurethral gland**

2C93.Z **Malignant neoplasms of urethra or paraurethral gland, unspecified**

2C94 Malignant neoplasms of bladder

A primary or metastatic malignant neoplasm involving the bladder.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C94.0 Adenocarcinoma of bladder

A rare adenocarcinoma arising from metaplastic bladder epithelium. It is frequently associated with long-standing local irritation. The majority of cases originate from the trigone and the posterior wall of the bladder.

2C94.1 Squamous cell carcinoma of bladder

A squamous cell carcinoma of the bladder arising from metaplastic epithelium. It represents less than 10% of bladder carcinomas. The exception is the Middle East along the Nile Valley, where it represents the most common form of carcinoma because of the endemic nature of schistosomiasis. Bladder squamous cell carcinoma is often associated with long-standing chronic inflammation of the bladder and usually has a poor prognosis. The diagnosis of squamous cell carcinoma of the bladder should be reserved for those tumours that are predominantly keratin forming.

2C94.2 Urothelial carcinoma of bladder

2C94.Y Other specified malignant neoplasms of bladder

2C94.Z Malignant neoplasms of bladder, unspecified

2C95 Malignant neoplasm involving overlapping sites of urinary organs

Malignant neoplasm of urinary organs whose point of origin cannot be classified to any other existing category

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2C95.0 Adenocarcinoma involving overlapping sites of urinary organs

2C95.1 Squamous cell carcinomas involving overlapping sites of urinary organs

2C95.2 Urothelial carcinoma involving overlapping sites of urinary organs

2C95.Y Other specified malignant neoplasms of overlapping lesion of urinary organs

2C95.Z Malignant neoplasm involving overlapping sites of urinary organs, unspecified

2C9Y Other specified malignant neoplasms of urinary tract

2C9Z Malignant neoplasms of urinary tract, unspecified

Malignant neoplasms of eye or ocular adnexa (2D00-2D0Z)

A malignant neoplasm affecting the structures of the eye.

Exclusions: Malignant neoplasm of optic nerve (2A02)

Malignant neoplasm of skin of eyelid (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Melanoma of uvea (2D0Y)

2D00 **Malignant neoplasm of conjunctiva**

A malignant growth of cells within the conjunctiva of the eye.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D00.0 Melanoma of conjunctiva

A malignant melanoma within the conjunctiva of the eye.

2D00.1 Malignant neoplasm of caruncle

This is a broad group of diseases involving unregulated cell growth of a small, red portion of the corner of the eye that contains modified sebaceous and sweat glands.

2D00.2 Squamous cell carcinoma of conjunctiva

2D00.Y Other specified malignant neoplasm of conjunctiva

2D00.Z Malignant neoplasm of conjunctiva, unspecified

2D01 **Malignant neoplasm of cornea**

A malignant growth of cells within the cornea of the eye.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D01.0 Melanoma of cornea

A melanoma within the cornea of the eye.

2D01.1 Squamous cell carcinoma of cornea

2D01.Y Other specified malignant neoplasms of cornea

2D01.Z Malignant neoplasm of cornea, unspecified

2D02 **Malignant neoplasm of retina**

Abnormal growth of cells comprising the retina with malignant characteristics.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D02.0 Adenocarcinoma of retinal pigment epithelium

This is a cancer of an epithelium that originates in glandular tissue. Epithelial tissue includes, but is not limited to, the surface layer of skin, glands, and a variety of other tissue that lines the cavities and organs of the body. This diagnosis is with the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.

2D02.1 Malignant neuroepithelial tumours of retina

2D02.2 Retinoblastoma

Retinoblastoma is the most common intraocular malignancy in children. It is a life threatening condition but is potentially curable. It can be hereditary or non-hereditary, unilateral or bilateral (unilateral retinoblastoma, bilateral retinoblastoma, see these terms).

2D02.Y Other specified malignant neoplasm of retina

2D02.Z Malignant neoplasm of retina, unspecified

2D03 Malignant neoplasm of lacrimal apparatus

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D03.0 Adenocarcinoma of the lacrimal apparatus

2D03.1 Mucoepidermoid carcinoma of lacrimal apparatus

2D03.2 Squamous cell carcinoma of the lacrimal apparatus

2D03.Y Other specified malignant neoplasm of lacrimal apparatus

2D03.Z Malignant neoplasm of lacrimal apparatus, unspecified

2D04 Malignant neoplasm of orbit

A primary or metastatic malignant neoplasm involving the orbit.

Exclusions: Benign neoplasm of orbital bone (2E83.0)

malignant neoplasm of orbital bone (2B50-2B5Z)

2D05 Malignant neoplasm of choroid

2D05.0 Melanoma of choroid

2D05.Y Other specified malignant neoplasm of choroid

2D05.Z Malignant neoplasm of choroid, unspecified

2D06 Malignant neoplasm of ciliary body

Inclusions: Malignant neoplasm of eyeball

2D06.0 Adenocarcinoma of ciliary epithelium

2D06.1 Malignant medulloepithelioma of ciliary body

2D06.3 **Malignant neuroepithelial tumours of ciliary body**

2D06.4 **Melanoma of ciliary body**

2D06.Y **Other specified malignant neoplasm of ciliary body**

2D06.Z **Malignant neoplasm of ciliary body, unspecified**

2D07 **Malignant neoplasm of iris**

2D07.0 **Adenocarcinoma of iris epithelium**

2D07.1 **Malignant neuroepithelial tumours of iris**

2D07.2 **Melanoma of iris**

2D07.Y **Other specified malignant neoplasm of iris**

2D07.Z **Malignant neoplasm of iris, unspecified**

2D0Y **Other specified malignant neoplasms of eye and ocular adnexa**

2D0Z **Malignant neoplasms of eye or ocular adnexa, unspecified**

Malignant neoplasms of endocrine glands (2D10-2D1Z)

A malignant neoplasm affecting the endocrine glands. Representative examples include thyroid gland carcinoma, parathyroid gland carcinoma, pituitary gland carcinoma, and adrenal cortex carcinoma.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D10 **Malignant neoplasms of thyroid gland**

A primary or metastatic malignant neoplasm affecting the thyroid gland.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

Coded Elsewhere: Thyroid lymphoma (2B33.5)

2D10.0 **Follicular carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. The nuclear features which characterise the thyroid gland papillary carcinoma are absent. Radiation exposure is a risk factor and it comprises approximately 10% to 15% of thyroid cancers. Clinically, it usually presents as a solitary mass in the thyroid gland. It is generally unifocal and thickly encapsulated and shows invasion of the capsule or the vessels. Diagnostic procedures include: thyroid ultrasound and fine needle biopsy.

2D10.1 **Papillary carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. Radiation exposure is a risk factor and it is the most common malignant thyroid lesion, comprising 75% to 80% of all thyroid cancers in iodine sufficient countries. Diagnostic procedures include: thyroid ultrasound, and fine needle biopsy. Microscopically, the diagnosis is based on the distinct characteristics of the malignant cells, which include enlargement, oval shape, elongation, and overlapping of the nuclei. The nuclei also display clearing or have a ground glass appearance.

2D10.2 **Poorly differentiated carcinoma of thyroid gland**

2D10.3 **Undifferentiated carcinoma of thyroid gland**

A primary carcinoma of the thyroid gland composed of undifferentiated cells. The malignant cells demonstrate evidence of epithelial differentiation, either by immunohistochemistry or electron microscopic studies. Microscopically, in the majority of cases there is a mixture of spindle, epithelioid, and giant cells. The vast majority of the patients present with a rapidly enlarging neck mass. The clinical course is invariably aggressive.

Inclusions: anaplastic carcinoma of thyroid gland

2D10.4 **Medullary carcinoma of thyroid gland**

A neuroendocrine carcinoma arising from the C-cells of the thyroid gland. It is closely associated with multiple endocrine neoplasia syndromes. Approximately 10% to 20% of medullary thyroid carcinomas are familial. Patients usually present with a thyroid nodule that is painless and firm. In the majority of cases nodal involvement is present at diagnosis.

2D10.Y **Other specified malignant neoplasms of thyroid gland**

2D10.Z **Malignant neoplasms of thyroid gland, unspecified**

2D11 Malignant neoplasms of adrenal gland

Tumours arising from the adrenal cortex include adenomas and carcinomas. These are rare neoplasms but may cause a variety of hormonal symptoms, including hyperaldosteronism, Cushing syndrome, and virilisation. A small fraction of adrenocortical tumours are associated with an inherited tumour syndrome, including Li-Fraumeni syndrome and Carney complex.

Benign and malignant phaeochromocytomas arise in the adrenal medulla and are derived from chromaffin cells of neural crest origin. Phaeochromocytomas may occur in the setting of several hereditary conditions, including multiple endocrine neoplasia types 2a and 2b, von Hippel Lindau disease and neurofibromatosis.

Extra adrenal paragangliomas arise from chromaffin cells in sympathoadrenal and parasympathetic paraganglia. They occur in many parts of the body and can pose a significant challenge to surgeons and oncologists. Some function as chemoreceptors, others are endocrinologically active. Familial paragangliomas are associated with mutations of the mitochondrial complex II genes.

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D11.0 **Adenocarcinoma of adrenal gland**

2D11.1 **Malignant phaeochromocytoma of adrenal gland**

2D11.2 **Neuroblastoma of adrenal gland**

Neuroblastomas are malignant tumours that form in certain types of the nerve tissue. It most often begins in the adrenal gland. About 1 out of 3 neuroblastomas start in the adrenal glands and about 1 out of 4 begin in sympathetic nerve ganglia in the abdomen. Most of the rest start in sympathetic ganglia near the spine in the chest or neck, or in the pelvis.

2D11.Y **Other specified malignant neoplasms of adrenal gland**

2D11.Z **Malignant neoplasms of adrenal gland, unspecified**

2D12 **Malignant neoplasms of other endocrine glands or related structures**

Exclusions: Malignant neoplasms of adrenal gland (2D11)

Malignant neoplasms of testis (2C80)

Malignant neoplasms of ovary (2C73)

Malignant neoplasm of pancreas (2C10)

Malignant neoplasms of thyroid gland (2D10)

Malignant neoplasms of thymus (2C27)

Malignant mesenchymal neoplasms (2B50-2B5Z)

2D12.0 **Malignant epithelial neoplasms of other endocrine glands or related structures, unspecified type**

2D12.1 **Adenocarcinoma of other endocrine glands or related structures**

2D12.Y **Other specified malignant neoplasms of other endocrine glands or related structures**

2D12.Z **Malignant neoplasms of other endocrine glands or related structures, unspecified**

2D1Z **Malignant neoplasms of endocrine glands, unspecified**

2D3Y **Other specified malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues**

2D3Z **Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues, unspecified**

Malignant neoplasms of ill-defined or unspecified primary sites (2D40-2D4Z)

Inclusions: metastatic cancer, unknown primary
metastatic cancer, unknown origin
metastatic cancer
metastatic disease

Exclusions: Malignant mesenchymal neoplasms (2B50-2B5Z)

2D40 **Adenocarcinoma of unspecified site**

A common cancer characterised by the presence of malignant glandular cells. Morphologically, adenocarcinomas are classified according to the growth pattern (e.g., papillary, alveolar) or according to the secreting product (e.g., mucinous, serous). Representative examples of adenocarcinoma are ductal and lobular breast carcinoma, lung adenocarcinoma, renal cell carcinoma, hepatocellular carcinoma (hepatoma), colon adenocarcinoma, and prostate adenocarcinoma.

2D41 **Unspecified carcinoma of unspecified site**

2D42 **Malignant neoplasms of ill-defined sites**

Malignant neoplasms of ill defined sites is used for cases where the documentation refers to a site that includes multiple organ systems and tissue types that should be coded separately.

2D43 **Malignant neoplasms of independent, multiple primary sites**

Coding Note: Use additional codes to identify individual neoplasms.

2D4Y **Other specified malignant neoplasms of unspecified primary sites**

2D4Z **Unspecified malignant neoplasms of unspecified sites**

Malignant neoplasm metastases (2D50-2E2Z)

Spread of a malignant neoplasm into secondary sites.

2D50 **Malignant neoplasm metastasis in brain**

A malignant neoplasm that has spread to the brain from another anatomic site or system. The majority are carcinomas (usually lung or breast carcinomas).

2D51 **Malignant neoplasm metastasis in meninges**

2D52 **Malignant neoplasm metastasis in spinal cord, cranial nerves or remaining parts of central nervous system**

Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z)

Exclusions: Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

2D60 **Malignant neoplasm metastasis in lymph node of a single region**

2D60.0 Malignant neoplasm metastasis in lymph nodes of head, face or neck

2D60.1 **Malignant neoplasm metastasis in intrathoracic lymph nodes**

2D60.2 **Malignant neoplasm metastasis in intra-abdominal lymph nodes**

2D60.3 **Malignant neoplasm metastasis in axillary lymph nodes**

2D60.4 **Malignant neoplasm metastasis in inguinal lymph nodes**

2D60.5 **Malignant neoplasm metastasis in intrapelvic lymph nodes**

2D60.Y **Other specified malignant neoplasm metastasis in lymph node of a single region**

2D60.Z **Malignant neoplasm metastasis in lymph node of a single region, unspecified**

2D61 **Malignant neoplasm metastases in lymph nodes of multiple regions**

2D6Z **Metastatic malignant neoplasm to unspecified lymph node**

Malignant neoplasm metastasis in thoracic or respiratory organs (2D70-2D7Z)

2D70 **Malignant neoplasm metastasis in lung**

Exclusions: Malignant neoplasms of bronchus or lung (2C25)

2D71 **Malignant neoplasm metastasis in mediastinum**

The spread of cancer to the mediastinum from an adjacent or distant anatomic site.

2D72 **Malignant neoplasm metastasis in pleura**

The spread of cancer to the pleura from an adjacent or distant anatomic site.

2D73 **Malignant neoplasm metastasis in upper respiratory tract organs**

2D7Y **Malignant neoplasm metastasis in other specified thoracic organs**

2D7Z **Malignant neoplasm metastasis in thoracic or respiratory organs, unspecified**

Malignant neoplasm metastasis in digestive system (2D80-2D8Z)

2D80 **Malignant neoplasm metastasis in liver or intrahepatic bile duct**

Malignant neoplasms that have metastasized to the liver from extrahepatic primary tumours.

2D80.0 **Malignant neoplasm metastasis in liver**

2D80.1 **Malignant neoplasm metastasis in intrahepatic bile duct**

2D81 **Malignant neoplasm metastasis in pancreas**

A malignant neoplasm that has spread to the pancreas from another anatomic site. Representative examples include metastatic carcinomas from the gastrointestinal tract, metastatic melanomas, and renal cell carcinomas.

2D82 **Malignant neoplasm metastasis in extrahepatic bile ducts**

2D83 **Malignant neoplasm metastasis in ampulla of Vater**

2D84 **Malignant neoplasm metastasis in the small intestine**

The spread of cancer to the small intestine. This may be from a primary intestinal cancer, or from a cancer at a distant site.

2D85 **Malignant neoplasm metastasis in large intestine**

The spread of cancer to the large intestine. This may be from a primary colon or rectal cancer, or from a cancer at a distant site.

2D86 **Malignant neoplasm metastasis in anus**

Malignant tumour that metastasized in the anus and anal canal.

2D8Y **Malignant neoplasm metastasis in other specified digestive system organ**

2D8Z **Malignant neoplasm metastasis in unspecified digestive system organ**

Malignant neoplasm metastasis in retroperitoneum or peritoneum (2D90-2D91)

2D90 **Malignant neoplasm metastasis in retroperitoneum**

2D91 **Malignant neoplasm metastasis in peritoneum**

Malignant neoplasm metastasis in other sites (2E00-2E0Y)

2E00 **Malignant neoplasm metastasis in kidney or renal pelvis**

The spread of the cancer to the kidney. This may be from a primary kidney cancer involving the opposite kidney, or from a cancer at a distant site.

2E01 **Malignant neoplasm metastasis in bladder**

Tumours of the urinary bladder that originate from an extravesical, non-urothelial tract neoplasm

2E02 **Malignant neoplasm metastasis in other or unspecified urinary system organs**

2E03 **Malignant neoplasm metastasis in bone or bone marrow**

The spread of a malignant neoplasm from a primary site to the skeletal system. The majority of metastatic neoplasms to the bone are carcinomas.

2E04 **Malignant neoplasm metastasis in soft tissue**

2E05 **Malignant neoplasm metastasis in female reproductive system**

2E05.0 **Malignant neoplasm metastasis in ovary**

The spread of the cancer to the ovary. This may be from a primary ovarian cancer involving the opposite ovary, or from a cancer at a distant site.

2E05.Y **Malignant neoplasm metastasis in other female reproductive system organs**

2E05.Z **Malignant neoplasm metastasis in female reproductive system, unspecified**

2E06 **Malignant neoplasm metastasis in male genital organs**

2E07 **Malignant neoplasm metastasis in adrenal gland**

A malignant tumour that has spread to the adrenal gland from an adjacent or distant anatomic site. The majority of cases are metastatic carcinomas, and less frequently lymphomas. (NCI05)

2E08 **Metastatic malignant neoplasm involving skin**

Involvement of the skin by metastatic spread from a known or unknown primary malignant neoplasm. The secondary deposit may result from local migration of malignant cells, or from regional lymphatic or haematogenous spread from more distant sites.

2E09 **Malignant neoplasm metastasis in peripheral nervous system**

2E0Y **Malignant neoplasm metastasis in other specified sites**

2E2Z **Malignant neoplasm metastasis, unspecified**

In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E60-2E6Z)

2E60 **Carcinoma in situ of oral cavity, oesophagus or stomach**

Exclusions: Melanoma in situ neoplasms (2E63)

2E60.0 **Carcinoma in situ of lip, oral cavity or pharynx**

Exclusions: Carcinoma in situ of aryepiglottic fold, laryngeal aspect (2E62.0)

Carcinoma in situ of epiglottis nos (2E62.0)

Carcinoma in situ of epiglottis, suprahyoid portion (2E62.0)

Carcinoma in situ of skin of lip (2E64)

2E60.1 **Carcinoma in situ of oesophagus**

Stage 0 includes: For squamous cell carcinoma: Tis (HGD), N0, M0, G1, GX, tumour location: Any. For adenocarcinoma: Tis (HGD), N0, M0, G1, GX. Tis: High-grade dysplasia. N0: No regional lymph node metastasis. M0: No distant metastasis. G1: Well differentiated. GX: Grade cannot be assessed-stage grouping as G1. tumour location: Location of the primary cancer site is defined by the position of the upper (proximal) edge of the tumour in the esophagus.

Coded Elsewhere: Oesophageal adenocarcinoma in situ (2E60.1)

2E60.2 **Carcinoma in situ of stomach**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial tumour without invasion of the lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

2E61 Carcinoma in situ of other or unspecified digestive organs

Exclusions: Melanoma in situ neoplasms (2E63)

2E61.0 Carcinoma in situ of colon

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial or invasion of lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

2E61.1 Carcinoma in situ of rectum

Malignant epithelial tumour of rectum that has not invaded adjacent tissue of the large intestine.

2E61.2 Carcinoma in situ of anal canal

Malignant epithelial tumour that has not invaded beyond the epithelium of the anal canal.

Exclusions: Carcinoma in situ of anal margin (2E64.2)

Carcinoma in situ of anal skin (2E64)

Carcinoma in situ of perianal skin (2E64.2)

2E61.3 Carcinoma in situ of gallbladder, biliary tract or ampulla of Vater

an early form of cancer without invasion of tumour cells into the surrounding tissue, usually before penetration through the basement membrane.

2E61.Y Carcinoma in situ of other specified digestive organs

2E61.Z Carcinoma in situ of unspecified digestive organs

2E62 Carcinoma in situ of middle ear or respiratory system

Exclusions: Melanoma in situ neoplasms (2E63)

2E62.0 Carcinoma in situ of larynx

Exclusions: Carcinoma in situ of aryepiglottic fold, hypopharyngeal aspect (2E60.0)

Carcinoma in situ of aryepiglottic fold, marginal zone (2E60.0)

Carcinoma in situ of aryepiglottic fold, NOS (2E60.0)

2E62.1 Carcinoma in situ of trachea

2E62.2 Carcinoma in situ of bronchus or lung

2E62.Y Carcinoma in situ of other specified sites of middle ear and respiratory system

2E62.Z Carcinoma in situ of unspecified sites of middle ear and respiratory system

2E63 Melanoma in situ neoplasms

Stage 0 includes: Tis, N0, M0. Tis: Melanoma in situ. N0: No regional lymph node metastases. M0: No detectable evidence of distant metastases.

2E63.0 **Melanoma in situ of skin**

Malignant melanoma confined to the epidermis and described as being in radial growth phase.

2E63.00 Lentigo maligna

An atypical proliferation of atypical melanocytes in the dermal-epidermal junction, without infiltration of the papillary or reticular dermis. The melanocytic proliferation is associated with actinic damage and epidermal atrophy. It usually occurs in the sun-exposed skin of elderly people. It is a form of melanoma in situ and in approximately 5% of cases it progresses to lentigo maligna melanoma.

2E63.0Z Melanoma in situ of skin, unspecified

2E63.1 **Melanoma in situ of conjunctiva**

2E63.Y **Melanoma in situ neoplasms, other specified site**

2E63.Z **Melanoma in situ neoplasms, unspecified site**

2E64 **Carcinoma in situ of skin**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ. N0: No regional lymph node metastasis. M0: No clinical or radiographic evidence of distant metastasis.

Exclusions: Melanoma in situ neoplasms (2E63)

Coded Elsewhere: Carcinoma in situ of vulva (2E67.1)

Carcinoma in situ of penis (2E67.4)

2E64.0 **Intraepidermal squamous cell carcinoma**

Malignant squamous neoplasia confined to the epidermis of extragenital skin and known commonly as Bowen disease. It arises most frequently on chronically sun-exposed glabrous skin of the head and neck or lower legs. It typically presents as single or multiple well-demarcated scaly erythematous patches, nodules or plaques which histologically show extensive keratinocytic atypia. It may develop from preexisting actinic keratosis (Actinic intraepidermal squamous cell carcinoma). Although it is most commonly associated with exposure to ultraviolet radiation, other carcinogens such as arsenic and tar may be implicated. Human papilloma virus may represent an additional risk factor in immunosuppressed patients.

2E64.00 Bowen disease of skin

Intraepidermal squamous cell carcinoma due to predisposing factors including chronic human papilloma virus infection, arsenic ingestion, ionising radtiation and chronic immunosuppression.

2E64.01 Actinic intraepidermal squamous cell carcinoma

Intraepidermal squamous cell carcinoma attributable to chronic exposure to ultraviolet radiation and typically developing from a pre-existing actinic keratosis

2E64.0Y Other specified intraepidermal squamous cell carcinoma

2E64.0Z Intraepidermal squamous cell carcinoma, unspecified

2E64.1 **Extramammary Paget disease of skin**

An intraepithelial adenocarcinoma of apocrine gland-bearing skin and mucous membrane. Clinically it presents as sharply demarcated erythematous plaques most commonly affecting the vulva in women and perianal skin in men.

Coded Elsewhere: Vulvar Paget disease (2E67.11)

2E64.2 **Carcinoma in situ of anal margin or perianal skin**

Carcinoma in situ of anal margin or perianal skin is most commonly squamous and related to oncogenic HPV strains, HIV infection or both. It may present as warty pigmented patches (Bowenoid papulosis).

2E64.Y **Other specified carcinoma in situ of skin**

2E64.Z **Carcinoma in situ of skin, unspecified**

2E65 Carcinoma in situ of breast

Exclusions: carcinoma in situ of skin of breast (2E64)

melanoma in situ of breast (skin) (2E63)

2E65.0 **Lobular carcinoma in situ of breast**

2E65.1 **Lobular carcinoma in situ of breast, pleomorphic subtype**

2E65.2 **Ductal carcinoma in situ of breast**

Exclusions: Atypical ductal hyperplasia of breast (2F75)

2E65.3 **Ductal carcinoma in situ of breast, comedo subtype**

2E65.4 **Mixed ductal and lobular carcinoma in situ of breast**

The co-existence of ductal and lobular carcinoma in situ in the breast, without evidence of stromal invasion.

2E65.5 **Paget disease of nipple**

Paget disease of the nipple describes a rare presentation of breast cancer, seen most frequently in women aged 50-60, manifesting with nipple drainage and itching, erythema, crusty, excoriated nipple, thickened plaques and hyperpigmentation (less frequently). It is due to tumour cells invading the nipple-areola complex and represents 1%-3% of all new breast cancer diagnoses.

2E65.Y **Other specified carcinoma in situ of breast**

2E65.Z **Carcinoma in situ of breast, unspecified**

2E66 Carcinoma in situ of cervix uteri

Exclusions: melanoma in situ of cervix (2E63)

Low grade squamous intraepithelial lesion of cervix uteri (GA15.7)

2E66.2 **High grade squamous intraepithelial lesion of cervix uteri**

2E66.Y **Other specified carcinoma in situ of cervix uteri**

2E66.Z **Carcinoma in situ of cervix uteri, unspecified**

2E67 Carcinoma in situ of other or unspecified genital organs

Exclusions: Melanoma in situ neoplasms (2E63)

2E67.0 **Carcinoma in situ of endometrium**

2E67.1 **Carcinoma in situ of vulva**

Exclusions: Low grade squamous intraepithelial lesion of vulva (GA13.1)

2E67.11 Vulvar Paget disease

An uncommon intraepithelial malignant neoplasm of eccrine or apocrine origin, arising from the vulva. It usually affects post-menopausal women. In approximately 10-20% of the cases there is an associated anorectal, or urothelial carcinoma or a skin appendage adenocarcinoma identified. It presents as a red, eczematous lesion. Microscopically, it is characterised by the presence of the typical Paget cells which are large, round cells with abundant cytoplasm and prominent nuclei.

2E67.12 Vulvar intraepithelial neoplasia, HPV-independent

Vulvar intraepithelial neoplasia (VIN), HPV-independent, is a non-invasive precursor of HPV-independent squamous cell carcinoma of the vulva, characterized by atypia of the basal and parabasal keratinocytes in an otherwise well-differentiated epithelium.

Exclusions: Low grade squamous intraepithelial lesion of vulva (GA13.1)

2E67.13 High grade squamous intraepithelial lesion of vulva , HPV-associated

Squamous intraepithelial lesions (SILs) of the vulva (also known as vulvar intraepithelial neoplasia [VIN]), HPV-associated, are proliferations of squamous cells driven by HPV infection, showing maturation abnormalities and nuclear hyperchromasia that do not extend beyond the basement membrane.

Coded Elsewhere: Bowenoid papulosis of the vulva (1A95.1)

2E67.2 **Carcinoma in situ of vagina**

2E67.22 High grade squamous intraepithelial lesion of vagina

2E67.2Y Other specified carcinoma in situ of vagina

2E67.2Z Carcinoma in situ of vagina, unspecified

2E67.3 **Carcinoma in situ of other or unspecified female genital organs**

2E67.4 **Carcinoma in situ of penis**

This comprises both squamous carcinoma in situ and extramammary Paget disease of the penis. The former is an uncommon precancerous disease of penile skin. Lesions usually appear on the glans or inner aspect of the foreskin and are almost always found in uncircumcised men. If left untreated, 10-30% of cases develop into invasive squamous cell carcinoma of the penis. When it affects the skin of the shaft or prepuce it is commonly called Bowen disease. If it affects the glans or inner surface of the prepuce it may also be referred to as penile intraepithelial neoplasia (or in the past as erythroplasia of Queyrat). Extramammary Paget disease of penis is a rare form of carcinoma in situ involving penile skin or glans penis.

Coded Elsewhere: Extramammary Paget disease of penis (2E64.1)

2E67.40 Squamous cell carcinoma in situ of skin of penis

Squamous cell carcinoma affecting the skin of the prepuce or of the shaft of the penis and commonly called Bowen disease. HPV infection and chronic exposure to psoralen photochemotherapy are predisposing factors.

Inclusions: Bowen disease of skin of penis

2E67.41 Squamous cell carcinoma in situ of mucocutaneous epithelium of penis

Inclusions: Penile intraepithelial neoplasia of inner preputial epithelium

Penile intraepithelial neoplasia of glans penis

2E67.5 **High grade intraepithelial lesion of prostate**

High grade prostatic intraepithelial neoplasia characterised by the presence of severe architectural and cytologic abnormalities.

Inclusions: high grade prostatic intraepithelial neoplasia

Exclusions: low grade dysplasia of prostate (GA91.6)

2E67.6 **Carcinoma in situ of other or unspecified male genital organs**

2E68 Carcinoma in situ of bladder

Stage 0is includes: Tis, N0, M0. Tis: Carcinoma in situ: flat tumour. N0: No regional lymph node metastasis. M0: No distant metastasis.

2E69 Carcinoma in situ of other or unspecified urinary organs

2E6A Carcinoma in situ of the eye or ocular adnexa

2E6A.0 **Carcinoma in situ of the conjunctiva**

Exclusions: Melanoma in situ of conjunctiva (2E63.1)

2E6A.1 **Carcinoma in situ of the cornea**

2E6A.Y **Carcinoma in situ of other and unspecified part of the eye and adnexa**

2E6B Carcinoma in situ of thyroid and other endocrine glands

Exclusions: Carcinoma in situ of ovary (2E67.3)

Carcinoma in situ of testis (2E67.6)

2E6Y Carcinoma in situ of other specified site

2E6Z **Carcinoma in situ of unspecified site**

Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E80-2F5Z)

A neoplasm which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

Benign mesenchymal neoplasms (2E80-2E8Z)

Bening neoplasms of muscle, fat, fibrous tissue, bone, cartilage, and blood vessels.

2E80 **Benign lipomatous neoplasm**

A benign tumour composed of adipose (fatty) tissue. The most common representative of this category is the lipoma.

2E80.0 Lipoma

2E80.00 Superficial subcutaneous lipoma

A benign well-circumscribed mesenchymal neoplasm composed of mature adipocytes and commonly known as a lipoma.

2E80.01 Deep subfascial lipoma

Deep subfascial lipomata are benign neoplasms of adipose tissue which arise deep to the deep fascia and have a tendency to infiltrate between and into muscle. They may occur at any body site and may cause diagnostic difficulty. They are well recognised to occur on the forehead beneath the frontalis muscle (frontalis-associated lipoma).

Inclusions: Frontalis-associated lipoma
Infiltrating lipoma of soft tissue
Intramuscular lipoma of soft tissue

2E80.02 Deep internal or visceral lipoma

2E80.0Y Lipoma, other specified site

2E80.0Z Lipoma, unspecified site

2E80.1 Lipoblastoma

2E80.Y Other specified benign lipomatous neoplasm

2E80.Z Benign lipomatous neoplasm, unspecified

2E81 **Benign vascular neoplasms**

Exclusions: Blue naevus (2F20)
Pigmented naevus (2F20)

Coded Elsewhere: Lobular capillary haemangioma (2F26)

2E81.0 **Neoplastic haemangioma**

Exclusions: Benign vascular neoplasms of infancy and childhood (2E81.2)

Infantile haemangioma (2E81.2)

Coded Elsewhere: Pulmonary sclerosing haemangioma (2F00.Y)

2E81.00 Umbilical cord haemangioma

tumour composed of thin walled blood vessels lined by endothelium present within the cord

2E81.01 Conjunctival haemangioma or haemolymphangioma

2E81.0Y Neoplastic haemangioma of other specified site

2E81.0Z Neoplastic haemangioma, unspecified site

2E81.1 **Benign lymphatic neoplasms**

Benign circumscribed or diffuse neoplasms of lymphatic vessels. They are are much less common than lymphatic malformations and are distinguished from the latter by proliferative growth and the potential to become widely disseminated.

Exclusions: Lymphatic malformations (LA90.1)

2E81.10 Disseminated lymphangiomatosis

A rare disorder characterised by widespread proliferation of aberrant lymphatic vessels which typically infiltrate vital organs in the thorax and abdomen.

2E81.11 Acquired progressive lymphangioma

Acquired progressive lymphangioma is a benign localised but slowly progressive tumour of lymphatic vessels that typically presents as reddish or bruise-like plaques on the abdominal wall, thigh or calf of young adolescents.

Exclusions: Lymphatic malformations (LA90.1)

2E81.1Y Other specified benign lymphatic neoplasms

2E81.1Z Benign lymphatic neoplasms, unspecified

2E81.2 **Benign vascular neoplasms of infancy and childhood**

The commonest benign vascular neoplasm of infancy is infantile haemangioma. Less common neoplasms are congenital haemangioma, spindle cell haemangioma, tufted angioma and kaposiform haemangioendothelioma.

2E81.20 Focal infantile haemangioma

Infantile haemangioma is a common benign vascular neoplasm which develops in about 4% of infants. It appears within weeks of birth as a blanched, blushed, or telangiectatic area that then rapidly proliferates for several months before entering a prolonged process of involution lasting up to 12 years, leaving a residual variably prominent scar. A solitary focal tumour is seen in about 85% of cases. Over half of cases are located on the head and neck. Complications include bleeding, infection, ulceration and, in tumours situated close to the eye, amblyopia.

Inclusions: Strawberry naevus

2E81.21 Multifocal infantile haemangioma

Infantile haemangioma is multifocal in up to 25% of cases with numbers ranging from a few to many dozens. If more than 5 cutaneous tumours are present there is an increased risk of associated internal haemangiomatosis, especially of the liver.

2E81.2Y Other specified benign vascular neoplasms of infancy and childhood

2E81.2Z Benign vascular neoplasms of infancy and childhood, unspecified

2E81.Y Other specified benign vascular neoplasms

2E81.Z Benign vascular neoplasms, unspecified

2E82 Benign chondrogenic tumours

2E82.0 Benign chondrogenic tumours of bone or articular cartilage of limbs

2E82.1 Benign chondrogenic tumours of bone or articular cartilage of other specified sites

2E82.Z Benign chondrogenic tumours, site unspecified

2E83 Benign osteogenic tumours

A neoplasm arising from the bone or articular cartilage that does not invade adjacent tissues or metastasize to other anatomic sites. Representative examples include benign fibrous histiocytoma of bone, osteoma, osteoblastoma, chondroblastoma, and enchondroma.

2E83.0 Benign osteogenic tumours of bone or articular cartilage of skull or face

2E83.1 Benign osteogenic tumours of bone or articular cartilage of lower jaw

2E83.2 Benign osteogenic tumours of bone or articular cartilage of vertebral column

Exclusions: Benign osteogenic tumour of sacrum (2E83.4)

2E83.3 Benign osteogenic tumours of bone or articular cartilage of ribs, sternum or clavicle

2E83.4 Benign osteogenic tumours of bone or articular cartilage of pelvic bones, sacrum or coccyx

2E83.5 Benign osteogenic tumours of bone or articular cartilage of limbs

2E83.Y Benign osteogenic tumour of other specified site

2E83.Z Benign osteogenic tumour of unspecified site

2E84 Benign fibrogenic or myofibrogenic tumour

2E84.0 Benign fibrogenic or myofibrogenic tumour of skin

2E84.Y Benign fibrogenic or myofibrogenic tumour of other specified sites

2E84.Z Benign fibrogenic or myofibrogenic tumour, site unknown

2E85 Benign fibrohistiocytic tumour

Exclusions: Benign neoplasm of peripheral nerves or autonomic nervous system (2E90-2F3Z)

Benign lymphatic neoplasms (2E81.1)

Benign lipomatous neoplasm (2E80)

Haemangioma (2E81)

Benign neoplasm of uterine ligament, any (2F31)

Benign vascular neoplasms (2E81)

Leiomyoma of uterus (2E86.0)

Benign neoplasm of connective tissue of breast (2F30)

2E85.0 Benign fibrohistiocytic tumour of soft tissues of limbs

2E85.1 Benign fibrohistiocytic tumour of retroperitoneum or peritoneum

Exclusions: Benign lipomatous neoplasm (2E80)

Benign neoplasm of mesothelial tissue (2F10)

2E85.2 Benign fibrohistiocytic tumour of skin

2E85.Y Benign fibrohistiocytic tumour of other specified sites

2E85.Z Benign fibrohistiocytic tumour, site unspecified

2E86 Benign smooth muscle or skeletal muscle tumour

2E86.0 Leiomyoma of uterus

A well-circumscribed benign smooth muscle neoplasm characterised by the presence of spindle cells with cigar-shaped nuclei, interlacing fascicles, and a whorled pattern.

Exclusions: Leiomyoma of ovary (2E86.1)

Leiomyoma of fallopian tube (2E86.1)

Leiomyoma of broad ligament (2E86.1)

Leiomyoma of vagina (2E86.1)

Leiomyoma of vulva (2E86.1)

Benign non-mesenchymal neoplasms of uterus (2F31)

2E86.1 Leiomyoma of other or unspecified sites

2E86.2 Rhabdomyoma

2E86.Y Other specified benign smooth muscle or skeletal muscle tumour

2E86.Z Benign smooth muscle or skeletal muscle tumour, unspecified

2E87 Benign gastrointestinal stromal tumour

2E88 Benign endometrial stromal nodule

2E89 Benign mesenchymal tumours of uncertain differentiation

2E89.0 **Benign tumours of uncertain differentiation, bone or cartilage**

2E89.1 **Benign tumours of uncertain differentiation, soft tissue**

2E89.Y **Benign mesenchymal tumours of uncertain differentiation of other specified site**

2E89.Z **Benign mesenchymal tumours of uncertain differentiation of unspecified site**

2E8A **Other mixed or unspecified benign mesenchymal tumours**

2E8Y **Other specified benign mesenchymal neoplasm**

2E8Z **Benign mesenchymal neoplasms, unspecified**

Benign non-mesenchymal neoplasms (2E90-2F3Z)

2E90 **Benign neoplasm of lip, oral cavity or pharynx**

2E90.0 **Benign neoplasm of lip**

A neoplasm without malignant characteristics arising from the lip.

Exclusions: Benign neoplasm of skin of lip (2F20-2F2Z)

2E90.1 **Benign neoplasm of tongue**

Abnormal growth, without malignant characteristics, of the cells that comprise the tongue.

2E90.2 **Benign neoplasm of floor of mouth**

2E90.3 **Benign neoplasm of other or unspecified parts of mouth**

Exclusions: Benign neoplasm of nasopharyngeal surface of soft palate (2E90.6)

benign odontogenic neoplasms (2E83.0)

mucosa of lip (2E90.0)

2E90.4 **Benign neoplasm of tonsil**

Exclusions: benign neoplasm of pharyngeal tonsil (2E90.6)

benign neoplasm of lingual tonsil (2E90.1)

benign neoplasm of tonsillar pillars (2E90.5)

benign neoplasm of tonsillar fossa (2E90.5)

2E90.5 **Benign neoplasm of oropharynx**

A neoplasm of the oropharynx which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

Exclusions: Benign neoplasm of epiglottis, NOS (2F00)

Benign neoplasm of epiglottis, suprahyoid portion (2F00)

2E90.6 **Benign neoplasm of nasopharynx**

A neoplasm of the nasopharynx which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

2E90.7 **Benign neoplasm of hypopharynx**

2E90.8 **Benign neoplasm of pharynx, unspecified**

2E91 Benign neoplasm of major salivary glands

Exclusions: Benign neoplasms of minor salivary glands NOS (2E90.3)

2E91.0 **Benign neoplasm of parotid gland**

2E91.1 **Benign neoplasm of other specified major salivary glands**

2E91.Z **Benign neoplasm of unspecified major salivary glands**

2E92 Benign neoplasm of digestive organs

A neoplasm of other and/or ill-defined parts of the digestive system which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

2E92.0 **Benign neoplasm of oesophagus**

A non-metastasizing neoplasm arising from the esophageal wall.

Coded Elsewhere: Benign mesenchymal tumour of oesophagus (2E8Y)

2E92.1 **Benign neoplasm of stomach**

A non-metastasizing neoplasm arising from the gastric wall.

Coded Elsewhere: Benign mesenchymal tumour of stomach (2E8Y)

2E92.2 **Benign neoplasm of duodenum**

A non-metastasizing neoplasm arising from the wall of the duodenum.

Coded Elsewhere: Benign mesenchymal tumour of duodenum (2E8Y)

2E92.3 **Benign neoplasm of other or unspecified parts of small intestine**

Exclusions: Benign neoplasm of duodenum (2E92.2)

Coded Elsewhere: Benign mesenchymal tumour of small intestine (2E8Y)

2E92.4 **Benign neoplasm of the large intestine**

A non-metastasizing neoplasm arising from the wall of the colon and rectum.

Coded Elsewhere: Benign mesenchymal tumour of large intestine (2E8Y)

2E92.40 Polyposis syndrome

Intestinal polyposis syndromes can be divided, based on histology, into the broad categories of familial adenomatous polyposis (FAP), hamartomatous polyposis syndromes, and other rare polyposis syndromes, such as hereditary-mixed polyposis syndrome (HMPS).

Coded Elsewhere: Gardner syndrome (LD2D.3)

Peutz-Jeghers syndrome (LD2D.0)

Cronkhite-Canada syndrome (LD27.01)

Familial adenomatous polyposis (2B90.Y)

Juvenile gastrointestinal polyposis (2B90.Y)

2E92.4Y Other specified benign neoplasm of the large intestine

2E92.4Z Benign neoplasm of the large intestine, unspecified

2E92.5 Benign neoplasm of anus or anal canal

Primary benign tumour that forms in tissues lining the anus and anal canal.

Exclusions: Benign neoplasm of perianal skin (2F20-2F2Z)

Benign neoplasm of anal margin (2F20-2F2Z)

Benign neoplasm of anal skin (2F20-2F2Z)

2E92.6 Benign neoplasm of gallbladder, extrahepatic bile ducts or ampulla of Vater

Coded Elsewhere: Benign mesenchymal tumour of gallbladder, extrahepatic bile ducts or ampulla of Vater (2E8Y)

Adenoma of bile ducts (2E92.6)

2E92.7 Benign neoplasm of liver or intrahepatic bile ducts

Coded Elsewhere: Focal nodular hyperplasia of liver (DB99.Y)

Angiomyolipoma of liver (2E80.02)

Haemangioma of liver (2E81.0Y)

2E92.8 Benign neoplasm of pancreas

A non-metastasizing neoplasm arising from the pancreas.

Exclusions: Benign neoplasm of endocrine pancreas (2E92.9)

2E92.9 Benign neoplasm of endocrine pancreas

Inclusions: Islet cell tumour

benign neoplasm of islets of Langerhans

2E92.A Benign neoplasm of ill-defined site within the digestive system

2E92.Y Benign neoplasm of other specified digestive organs

2E92.Z Benign neoplasm of unspecified digestive organs

Benign neoplasm of respiratory or intrathoracic organs (2F00-2F0Z)

2F00 **Benign neoplasm of middle ear or respiratory system**

2F00.0 **Middle ear endocrine tumour**

2F00.1 **Recurrent respiratory papillomatosis**

Recurrent respiratory papillomatosis is a rare respiratory disease characterised by the development of exophytic papillomas, affecting the mucosa of the upper aero-digestive tract (with a strong predilection for the larynx), caused by an infection with human papilloma virus. Symptoms at presentation may include hoarseness, chronic cough, dyspnoea, recurrent upper respiratory tract infections, pneumonia, dysphagia, stridor, and/or failure to thrive.

2F00.2 **Laryngeal endocrine tumour**

2F00.Y **Other specified benign neoplasm of middle ear or respiratory system**

2F00.Z **Benign neoplasm of middle ear or respiratory system, unspecified**

2F01 **Benign neoplasm of intrathoracic organs**

2F0Y **Benign neoplasms of other specified respiratory and intrathoracic organs**

2F0Z **Benign neoplasms of unspecified respiratory and intrathoracic organs**

2F10 **Benign neoplasm of mesothelial tissue**

A benign neoplasm arising from mesothelial cells. It is characterised by the formation of glandular and tubular patterns. It can occur in several anatomic sites including the pleura, peritoneum, and epididymis.

Benign cutaneous neoplasms (2F20-2F2Z)

Abnormal growth of the cells that comprise the tissues of the skin, without any evidence of malignancy.

Coded Elsewhere: Benign vascular neoplasms of infancy and childhood (2E81.2)

2F20 **Benign cutaneous melanocytic neoplasms**

Inclusions: Mole

Pigmented naevus

Benign melanocytic naevus

2F20.0 **Common acquired melanocytic naevus**

2F20.00 Multiple benign melanocytic naevi

The presence of multiple benign melanocytic naevi (often taken as more than 20 naevi >2mm in diameter), an independent risk factor for the development of melanoma with highest risk associated with highest numbers of naevi (>100).

2F20.0Y Other specified common acquired melanocytic naevus

2F20.1 **Atypical melanocytic naevus**

Solitary or multiple, slightly raised, pigmented lesions with irregular borders, usually measuring more than 0.6cm in greatest dimension. Morphologically, there is melanocytic atypia and the differential diagnosis from melanoma may be difficult. Patients are at an increased risk for the development of melanoma.

Inclusions: Dysplastic naevus, unspecified

2F20.2 **Congenital melanocytic naevus**

Congenital melanocytic naevi are circumscribed areas of skin pigmentation present at birth as a result of abnormal intrauterine proliferation of melanocytes within the dermis, the epidermis or both. They may range in size from a few millimetres to many centimetres in diameter. If their projected or final adult maximal diameter is greater than 20 cm they are termed giant congenital melanocytic naevi.

2F20.20 Giant congenital melanocytic naevus

A congenital melanocytic naevus (CMN) with a predicted or final adult maximal diameter of 400 mm or more. Giant CMNs are commonly centred on the dorsal surface of the body between the vertex and the buttocks but may occur elsewhere; they may be associated with multiple smaller satellite naevi (congenital or tardive), hypertrichosis, lipomas or benign proliferative nodules. There is a risk of pre-pubertal melanoma within giant CMN or the central nervous system (CNS). Leptomeningeal melanocytosis or focal neuromelanosis, found in 10-15% of cases, is often associated with other CNS tumours, hydrocephalus, epilepsy, arachnoid cysts, or Dandy-Walker malformation.

2F20.2Y Other specified congenital melanocytic naevus

2F20.2Z Congenital melanocytic naevus, unspecified

2F20.3 **Generalised eruptive melanocytic naevi**

This phenomenon describes the rapid simultaneous appearance of multiple melanocytic naevi, often hundreds in number, on previously uninvolved sun-exposed skin. The phenomenon has been linked to immunosuppression, particularly in renal transplant recipients and in individuals receiving cancer chemotherapy, and may be considered a more advanced counterpart of generalised eruptive lentiginosis.

Exclusions: Multiple benign melanocytic naevi (2F20.00)

Generalized eruptive lentiginosis (ED61)

2F20.Y **Other specific types of melanocytic naevus**

2F20.Z **Melanocytic naevus, unspecified**

2F21 Benign keratinocytic acanthomas

A group of benign discrete epidermal proliferative disorders including seborrhoeic keratosis and clear cell acanthoma.

2F21.0 **Seborrhoeic keratosis**

Seborrhoeic keratoses are very common benign neoplasms of epidermal keratinocytes which increase in prevalence and number with age. They are commonly multiple and are very variable in shape and colour. Because of the sometimes intense pigmentation they are frequently mistaken for melanocytic tumours.

Inclusions: Basal cell papilloma

Seborrheic wart

2F21.Y **Other specified benign keratinocytic acanthomas**

2F22 **Benign neoplasms of epidermal appendages**

A range of benign neoplasms arising from the hair follicle, its associated glands or from sweat glands.

2F23 **Benign dermal fibrous or fibrohistiocytic neoplasms**

Benign dermal neoplasms due to abnormal proliferation of fibroblasts, myofibroblasts or primitive mesenchymal cells.

2F23.0 **Dermatofibroma**

A common benign skin tumour which presents as a firm dermal papule or nodule, most commonly on the lower limbs. Histologically it is characterised by coarse, haphazardly arranged collagen bundles and a variable cellular infiltrate including fibrocytes.

2F23.Y **Other specified benign dermal fibrous or fibrohistiocytic neoplasms**

2F24 **Benign cutaneous neoplasms of neural or nerve sheath origin**

2F25 **Cherry angioma**

Inclusions: Campbell de Morgan spot

Senile angioma

2F26 **Lobular capillary haemangioma**

Historically called pyogenic granuloma, this is a common benign proliferation of capillary blood vessels which may be induced by trauma or by certain drugs. It presents as one or more bright red papules or nodules often located around the mouth or on a terminal phalanx in relation to the nail. Bleeding, ulceration and crusting frequently occur. BRAF mutations within vascular endothelial cells may be present, indicating that this is, in at least a proportion of cases, a true neoplastic process.

Inclusions: Lobular capillary haemangioma of skin

2F2Y **Other specified benign cutaneous neoplasms**

2F2Z **Benign cutaneous neoplasm of unspecified type**

2F30 Benign neoplasm of breast

A non-metastasizing neoplasm arising from the breast parenchyma.

Exclusions: Benign neoplasm of skin of breast (2F20-2F2Z)

Lipoma (2E80.0)

2F30.0 Tubular adenoma of breast

A benign, well circumscribed neoplasm that arises from the breast. It is composed entirely of tubular structures that contain epithelial and myoepithelial cells.

2F30.1 Lactating adenoma of breast

A tubular type adenoma of the breast in which, during pregnancy and lactation, the epithelial cells show extensive secretory changes.

2F30.2 Intraductal papilloma of breast

A benign papillary neoplasm that arises anywhere in the ductal system of the breast. It is characterised by fibrovascular structures lined by benign epithelial and myoepithelial proliferations. Intraductal breast papillomas are classified as central, when they arise in large ducts, or peripheral, when they arise in the terminal ductal lobular units.

2F30.3 Benign phyllodes tumour of breast

A usually unilateral, benign and well circumscribed biphasic neoplasm that arises from the breast. It usually affects middle-aged women. It is characterised by the presence of a double layer of epithelial cells that are arranged in clefts, surrounded by a cellular, monomorphic spindle cell mesenchymal component. Mitoses are rare. Necrotic changes may be present in large tumours.

2F30.4 Fibromatosis of breast

2F30.5 Fibroadenoma of breast

A benign tumour of the breast characterised by the presence of stromal and epithelial elements. It presents as a painless, solitary, slow growing, firm, and mobile mass. It is the most common benign breast lesion. It usually occurs in women of childbearing age. The majority of fibroadenomas do not recur after complete excision. A slightly increased risk of developing cancer within fibroadenomas or in the breast tissue of patients previously treated for fibroadenomas has been reported.

2F30.6 Extensive adenomatosis of nipple

Rare benign nipple condition presenting as pruritus, burning or pain symptoms with clinical signs showing a nipple which appears ulcerated, crusting, scaling, indurated and erthymatous. Differential diagnosis: Paget, psoriasis, etc

2F30.Y Other specified benign neoplasm of breast

2F30.Z Benign neoplasm of breast, unspecified

2F31 Benign non-mesenchymal neoplasms of uterus

Other non-malignant tumours of the uterus not detailed elsewhere.

Exclusions: Leiomyoma of uterus (2E86.0)

2F31.0 **Benign non-mesenchymal neoplasm of uterus, cervix uteri**

Exclusions: Low grade squamous intraepithelial lesion of cervix uteri (GA15.7)

2F31.1 **Benign non-mesenchymal neoplasm of uterus, corpus uteri**

2F31.2 **Benign non-mesenchymal neoplasms of uterus, other parts**

2F32 **Benign neoplasm of ovary**

A non-metastasizing neoplasm that arises from the ovary. Representative examples include serous cystadenoma, mucinous cystadenoma, clear cell adenofibroma, benign Brenner tumour, thecoma, and fibroma.

Coded Elsewhere: Struma ovarii (5A02.Y)

2F32.0 **Cystic teratoma**

A condition of the ovary, caused by abnormal proliferation due to genetic mutations, abnormal growth or division of germ cells. This condition is characterised by a benign ovarian neoplasm, and abdominal pain, mass or swelling, or abnormal uterine bleeding, and may lead to ovarian torsion or cystic rupture. Confirmation is by imaging.

2F32.1 **Ovarian fibroma**

A condition of the ovary, caused by abnormal proliferation due to genetic mutations, abnormal growth or division of cells. This condition is characterised by a benign sex chord ovarian tumour. Confirmation is by imaging.

2F32.2 **Meigs' Syndrome**

Benign Syndrome including ovarian fibroma, ascites and pleural effusion

2F32.3 **Serous ovarian cystadenoma**

2F32.Y **Other specified benign neoplasm of ovary**

2F32.Z **Benign neoplasm of ovary, unspecified**

2F33 **Benign neoplasm of other or unspecified female genital organs**

A non-metastasizing neoplasm that arises from the female reproductive system. Representative examples include uterine corpus leiomyoma, endocervical polyp, and benign ovarian germ cell tumour.

2F34 **Benign neoplasm of male genital organs**

A non-metastasizing neoplasm that arises from the male reproductive system. Representative examples include benign prostate phyllodes tumour, benign Sertoli cell tumour, seminal vesicle cystadenoma, and epididymal adenomatoid tumour.

2F35 **Benign neoplasm of urinary organs**

A non-metastasizing neoplasm that arises from the organs that comprise the urinary system. Representative examples include renal oncocytoma, bladder inverted papilloma, and urothelial papilloma.

2F36 **Benign neoplasm of eye or ocular adnexa**

Exclusions: Benign neoplasm of optic nerve (2A02.3)

Benign neoplasm of skin of eyelid (2F20-2F2Z)

Coded Elsewhere: Epibulbar choristoma (LA14.06)

Seborrhoeic keratosis (2F21.0)

2F36.0 Benign neoplasm of choroid

Abnormal growth of the cells of the choroid without malignant characteristics.

Coded Elsewhere: Haemangioma of choroid (2E81.0Y)

2F36.1 Benign neoplasm of iris

2F36.2 Benign neoplasm of ciliary body

2F36.3 Teratoma of orbit

This is an encapsulated tumour with tissue or organ components resembling normal derivatives of all three germ layers. This diagnosis is of the cavity or socket of the skull in which the eye and its appendages are situated.

2F36.4 Cysts of eyelid

Coded Elsewhere: Epidermoid cyst (EK70.0)

2F36.Y Other specified benign neoplasm of eye or ocular adnexa

2F36.Z Benign neoplasm of eye or ocular adnexa, unspecified

2F37 **Benign neoplasm of endocrine glands**

Exclusions: Benign neoplasm of endocrine pancreas (2E92.9)

Benign neoplasm of thymus (2F01)

Benign neoplasm of ovary (2F32)

Benign neoplasm of testis (2F34)

Benign neoplasm of hypothalamus (2A00.5)

2F37.0 Non-secreting pituitary adenoma

2F37.Y Other specified benign neoplasm of endocrine glands

2F37.Z Benign neoplasm of endocrine glands, unspecified

2F3Y **Benign non-mesenchymal neoplasms of other specified site**

2F3Z **Benign non-mesenchymal neoplasms of unspecified site**

2F5Y **Other specified benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues**

2F5Z **Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues, unspecified**

Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F70-2F7Z)

A neoplasm displaying morphologic, phenotypic, or genotypic characteristics that are clearly not benign but do not permit the establishment of a definitive diagnosis of malignancy. Such neoplasms may or may not eventually have a more aggressive clinical course. Representative examples include lymphoproliferations of uncertain malignant potential (e.g., lymphomatoid granulomatosis and lymphomatoid papulosis), borderline ovarian epithelial neoplasms (e.g., borderline ovarian endometrioid tumour and borderline ovarian mucinous tumour), borderline exocrine pancreatic neoplasm (e.g., pancreatic borderline intraductal papillary-mucinous neoplasm), and primary borderline peritoneal epithelial neoplasm.

Coded Elsewhere: Pathological fracture in neoplastic disease of uncertain behaviour (FB80.B)

2F70 **Neoplasms of uncertain behaviour of oral cavity or digestive organs**

2F70.0 **Neoplasms of uncertain behaviour of lip, oral cavity or pharynx**

2F70.1 **Neoplasms of uncertain behaviour of stomach**

2F70.2 **Neoplasms of uncertain behaviour of small intestine**

2F70.3 **Neoplasms of uncertain behaviour of colon**

2F70.4 **Neoplasms of uncertain behaviour of rectum**

2F70.5 **Neoplasms of uncertain behaviour of liver, gallbladder or bile ducts**

2F70.Y **Neoplasms of uncertain behaviour of oral cavity and digestive organs, other specified site**

2F70.Z **Neoplasms of uncertain behaviour of oral cavity and digestive organs, unspecified site**

2F71 **Neoplasms of uncertain behaviour of middle ear, respiratory or intrathoracic organs**

2F71.0 **Neoplasms of uncertain behaviour of thymus**

2F71.1 **Neoplasms of uncertain behaviour of larynx**

2F71.2 **Neoplasms of uncertain behaviour of pleura**

2F71.3 **Neoplasms of uncertain behaviour of trachea, bronchus or lung**

2F71.4 **Neoplasms of uncertain behaviour of mediastinum**

2F71.Y **Neoplasms of uncertain behaviour of middle ear, respiratory and intrathoracic organs, other specified site**

2F71.Z **Neoplasms of uncertain behaviour of middle ear, respiratory and intrathoracic organs, unspecified site**

2F72 **Neoplasms of uncertain behaviour of skin**

2F72.1 **Spitzoid tumour of uncertain malignant potential**

A spindle cell and epithelioid cell melanocytic neoplasm in which there are sufficient features distinguishing it from a benign Spitz naevus to cast doubt on its benign nature. These atypical features include development in adult life, asymmetry, large diameter (>6 and especially >10 mm), significant thickness (particularly subcutaneous extension), lack of “maturation” and nodule formation, cytological atypia and a high mitotic rate.

2F72.2 **Melanocytic naevus with severe melanocytic dysplasia**

Melanocytic naevus with severe melanocytic dysplasia is a histopathological diagnosis based on the presence of severe cytological atypia, defined as enlarged, spindle- and epithelioid-shaped melanocytes with hyperchromatic nuclei (typically at least twice the size of those of basal keratinocytes) and distinct nucleoli. Such naevi tend to be irregular in size and pigmentation and to have been excised because of concern that they may represent early melanoma.

2F72.Y **Other specified neoplasms of uncertain behaviour of skin**

2F73 **Neoplasms of uncertain behaviour of retroperitoneum**

2F74 **Neoplasms of uncertain behaviour of peritoneum**

2F75 **Neoplasms of uncertain behaviour of breast**

2F76 **Neoplasms of uncertain behaviour of female genital organs**

2F77 **Neoplasms of uncertain behaviour of male genital organs**

2F78 **Neoplasms of uncertain behaviour of urinary organs**

2F79 **Neoplasms of uncertain behaviour of eye or ocular adnexa**

2F7A **Neoplasms of uncertain behaviour of endocrine glands**

2F7A.0 **Multiple polyglandular tumours**

Coded Elsewhere: Carney complex (5A70.Y)
Von Hippel-Lindau disease (5A75)

2F7A.Y **Other specified neoplasms of uncertain behaviour of endocrine glands**

2F7A.Z **Neoplasms of uncertain behaviour of endocrine glands, unspecified**

2F7B **Neoplasms of uncertain behaviour of bone or articular cartilage**

2F7C **Neoplasms of uncertain behaviour of connective or other soft tissue**

2F7Y **Neoplasms of uncertain behaviour of other specified site**

2F7Z **Neoplasms of uncertain behaviour of unspecified site**

Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F90-2F9Z)

Coded Elsewhere: Pathological fracture in neoplastic disease of unknown behaviour (FB80.B)

2F90 **Neoplasms of unknown behaviour of oral cavity or digestive organs**

2F90.0 **Neoplasms of unknown behaviour of colon**

2F90.1 **Neoplasms of unknown behaviour of rectum**

2F90.Y **Neoplasms of unknown behaviour of oral cavity and digestive organs, other specified site**

2F90.Z **Neoplasms of unknown behaviour of oral cavity and digestive organs, unspecified site**

2F91 **Neoplasms of unknown behaviour of middle ear, respiratory or intrathoracic organs**

2F91.0 **Neoplasms of unknown behaviour of larynx**

2F91.1 **Neoplasms of unknown behaviour of trachea, bronchus or lung**

2F91.Y **Neoplasms of unknown behaviour of other specified middle ear, respiratory or intrathoracic organ**

2F92 **Neoplasms of unknown behaviour of skin**

2F93 **Neoplasms of unknown behaviour of retroperitoneum**

2F94 **Neoplasms of unknown behaviour of peritoneum**

2F95 **Neoplasms of unknown behaviour of breast**

2F96 **Neoplasms of unknown behaviour of female genital organs**

2F97 **Neoplasms of unknown behaviour of male genital organs**

2F98 **Neoplasms of unknown behaviour of urinary organs**

2F99 **Neoplasms of unknown behaviour of eye or ocular adnexa**

2F9A **Neoplasms of unknown behaviour of endocrine glands**

2F9B **Neoplasms of unknown behaviour of bone or articular cartilage**

2F9C **Neoplasms of unknown behaviour of connective or other soft tissue**

2F9Y **Neoplasms of unknown behaviour of other specified site**

2F9Z **Neoplasms of unknown behaviour of unspecified site**

CHAPTER 03

Diseases of the blood or blood-forming organs

This chapter has 56 four-character categories.

Code range starts with 3A00

This chapter includes diseases of the blood as well as diseases of blood forming organs.

Exclusions: Complications of pregnancy, childbirth or the puerperium (Chapter 18)

Diseases of the immune system (Chapter 04)

Certain conditions originating in the perinatal period (Chapter 19)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Human immunodeficiency virus disease (1C60-1C62.Z)

Endocrine, nutritional or metabolic diseases (Chapter 05)

Congenital malformations, deformations or chromosomal abnormalities (Chapter 20)

Other diseases of the blood or blood-forming organs or certain disorders involving the immune mechanism complicating pregnancy, childbirth or the puerperium (JB64.1)

Coded Elsewhere: Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA00-MA3Y)

This chapter contains the following top level blocks:

- Anaemias or other erythrocyte disorders
- Coagulation defects, purpura or other haemorrhagic or related conditions
- Diseases of spleen

Anaemias or other erythrocyte disorders (3A00-3A9Z)

Inclusions: Anaemia, unspecified

Coded Elsewhere: Anaemia complicating pregnancy, childbirth or the puerperium (JB64.0)

Anaemia of prematurity (KA8B)

Nutritional or metabolic anaemias (3A00-3A03.Y)

3A00 **Iron deficiency anaemia**

A disease caused by chronic or acute bleeding, excessive menstrual bleeding, inadequate intake, substances (in diet or drugs) interfering with iron absorption, malabsorption syndromes, inflammation, infection or blood donation. This disease is characterised by decreased levels of iron present in the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of decreased levels of iron in a blood sample.

3A00.0 **Acquired iron deficiency anaemia due to blood loss**

Chronic blood loss is a possible cause in every case of iron-deficiency anaemia. Iron deficiency anaemia may be caused by acute bleeding in gastrointestinal tract, uterus or genitourinary system, copious menstrual blood losses (menorrhagia) and multiple blood donations. In many tropical countries, infestations with hookworms lead to intestinal blood losses that in some individuals can be considerable. Iron deficiency may also be caused by several circumstances related to “chronic posthaemorrhagic anaemia”. A diagnosis of iron deficiency should always lead to a search for pathologic causes of blood loss (e.g. tumours in the gastrointestinal tract or uterus, especially if uterine bleedings have increased or changed in regularity).

Exclusions: congenital anaemia from fetal blood loss (KA8C)

3A00.01 Chronic posthaemorrhagic anaemia

Chronic iron-deficiency anaemia from bleeding may be caused by colon cancer, gastric cancer, peptic ulcer, Meckel diverticulum, hiatal hernia with linear erosions, colonic vascular ectasia, colonic polyps, haemangioma, inflammatory bowel disease, tumours in the gastrointestinal tract or uterus, and chronic menorrhagia. Some infants with severe iron deficiency have chronic intestinal blood loss induced by exposure to cow's milk protein. Repeated phlebotomy for blood tests is a cause of anaemia of prematurity.

3A00.0Z Acquired iron deficiency anaemia due to blood loss, unspecified

3A00.1 **Acquired iron deficiency anaemia due to low intake**

Iron deficiency is probably the most common nutritional deficiency disorder in the world. Iron deficiency anaemia during pregnancy increases perinatal risks for mothers and neonates; and increases overall infant mortality. Severe anaemia is a major risk factor associated with greatly increased morbidity and mortality for young children and pregnant women. Prompt recognition of the condition, treatment and clinical follow-up of individuals, are crucial in avoiding complications such as high-output heart failure. Maternal iron deficiency during pregnancy increases the risk of iron deficiency in the infant. In less developed countries, the prevalence of iron deficiency during pregnancy is higher than in developed countries, and iron supplementation during pregnancy is beneficial.

3A00.2 **Acquired iron deficiency anaemia due to decreased absorption**

3A00.3 **Acquired iron deficiency anaemia due to increased requirement**

3A00.Y **Other specified iron deficiency anaemia**

3A00.Z **Iron deficiency anaemia, unspecified**

3A01 **Megaloblastic anaemia due to vitamin B12 deficiency**

A disease caused by inadequate dietary intake of vitamin B12, impaired absorption of vitamin B12, surgical removal of the small bowel, coeliac disease or inherited mutations affecting absorption of vitamin B12. This disease is characterised by decreased levels of vitamin B12 in the body presenting with or without anaemia. This disease may present with fatigue, pallor, dizziness, seizures, or symptoms of dementia. Confirmation is by identification of decreased levels of vitamin B12 in a blood sample.

3A01.0 **Hereditary Vitamin B12 deficiency anaemia**

This is a hereditary low blood level of vitamin B12. It can cause permanent damage to nervous tissue if left untreated long enough. Vitamin B12 itself was discovered through investigation of pernicious anaemia, which is an autoimmune disease that destroys parietal cells in the stomach that secrete intrinsic factor.

3A01.1 **Neonatal vitamin B12 deficiency anaemia**

A disease caused by a lack of vitamin B12 in the mother, which is passed onto the fetus in the antenatal period or to the neonate during breast feeding. This disease is characterised by decreased levels of vitamin B12. This disease may present with increased risk of birth defects or preterm delivery, anaemia, irritability, failure to thrive or apathy. Confirmation is by identification of low levels of vitamin B12 in a blood sample.

Exclusions: Hereditary Vitamin B12 deficiency anaemia (3A01.0)

3A01.2 **Vitamin B12 deficiency anaemia due to low intake**

A disease caused by insufficient intake of vitamin B12 into the body. This disease is characterised by low levels of vitamin B12 leading to low levels of red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of vitamin B12 and red blood cell count in a blood sample.

3A01.3 **Vitamin B12 deficiency anaemia due to intrinsic factor deficiency**

Exclusions: Vitamin B12 deficiency anaemia due to congenital intrinsic factor deficiency (3A01)

3A01.30 Pernicious anaemia

Biermer's disease, also called acquired pernicious anaemia, is a disorder in vitamin B12 (cobalamin) absorption characterised by megaloblastic anaemia and gastrointestinal symptoms, and that can lead to neurological abnormalities.

3A01.3Y Other specified vitamin B12 deficiency anaemia due to intrinsic factor deficiency

3A01.4 **Vitamin B12 deficiency anaemia due to intestinal disease**

A number of intestinal disorders can also cause vitamin B12 (cobalamin) deficiency. These include severe pancreatic diseases and small bowel diseases such as malabsorption, ileal disease (including tuberculous ileitis, lymphoma, amyloid, long-term survivors of pelvic irradiation), extensive small bowel resection or bypass, gastric surgery/reconstruction for obesity (bariatric surgery) and Crohn's disease. When jejunal blind loops are present, bacterial overgrowth within the loops competes for cobalamin, leading to cobalamin deficiency. Although not as common currently, infestation with the fish tapeworm, Diphyllobothrium latum, was once a classic cause of cobalamin deficiency.

Coding Note: Code also the causing condition

3A01.5 **Drug-induced vitamin B12 deficiency anaemia**

3A01.Y **Other specified megaloblastic anaemia due to vitamin B12 deficiency**

3A01.Z **Megaloblastic anaemia due to vitamin B12 deficiency, unspecified**

3A02 Folate deficiency anaemia

3A02.0 **Hereditary folate deficiency anaemia**

3A02.1 **Folate deficiency anaemia due to low intake**

3A02.2 **Folate deficiency anaemia due to increased requirements**

3A02.3 **Folate deficiency anaemia due to decreased intestinal absorption**

A disease caused by determinants affecting intestinal absorption of folate arising after birth. This disease is characterised by low levels of folate in the body leading to incomplete formation of red blood cells resulting in large numbers of immature and incompletely developed red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, tachycardia or extremity paraesthesia. Confirmation is by identification of low folate levels in a blood sample.

Coding Note: Code also the causing condition

3A02.4 **Drug-induced folate deficiency anaemia**

3A02.Y **Other specified folate deficiency anaemia**

3A02.Z **Folate deficiency anaemia, unspecified**

3A03 Other nutritional or metabolic anaemias

A disease caused by nutritional and metabolic determinants leading to anaemia. This disease is characterised by decreased levels of red blood cells within the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of a decreased red blood cell count in a blood sample.

Coded Elsewhere: Disorders of pyrimidine metabolism (5C55.1)

Lesch-Nyhan syndrome (5C55.01)

3A03.0 Hereditary orotic aciduria

Hereditary orotic aciduria is an extremely rare (less than 20 cases identified worldwide) autosomal recessive disorder characterised by retarded growth, anaemia and excessive urinary excretion of orotic acid. It is due to a severe deficiency in the activity of the pyrimidine pathway enzyme uridine 5'-monophosphate (UMP) synthase (bifunctional enzyme containing two activities: orotate phosphoribosyltransferase and orotidine 5'-monophosphate decarboxylase), coded by a single gene (UMPS) localised to chromosome 3q13.

3A03.1 Protein deficiency anaemia

A disease caused by low levels of protein within the body. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.

Exclusions: Lesch-Nyhan syndrome (5C55.01)

3A03.2 Scorbutic anaemia

Scorbutic anaemia, is a common finding in infants and young children with scurvy and is related to impaired iron absorption and coexistent haematopoietic nutrient deficiencies including iron, vitamin B12 and folate.

3A03.3 Copper deficiency anaemia

Anaemia due to copper deficiency arises from impaired utilization of iron and is therefore a conditioned form of iron deficiency anaemia.

3A03.4 Acquired other vitamin B deficiency anaemia

A disease caused by a lack of B vitamins in the body arising after birth. This disease is characterised by low levels of B vitamins leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count and low B vitamin counts in a blood sample.

3A03.40 Acquired pyridoxine deficiency anaemia

A disease caused by determinants arising after birth. This disease is characterised by low levels of pyridoxine (vitamin B6) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of pyridoxine and low red blood cell count in a blood sample.

3A03.41 Acquired riboflavin deficiency anaemia

A disease caused by determinants arising after birth. This disease is characterised low levels of riboflavin (vitamin B2) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of riboflavin and low red blood cell count in a blood sample.

3A03.42 Acquired thiamine deficiency anaemia

A disease caused by a lack of thiamine arising after birth. This disease is characterised low levels of thiamine in the body leading to low levels of red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of thiamine and low red blood cell count in a blood sample.

3A03.4Y Other specified acquired other vitamin B deficiency anaemia

3A03.5 Acquired vitamin A deficiency anaemia

3A03.6 Acquired vitamin E deficiency anaemia

Inclusions: Haemolytic anaemia due to vitamin E deficiency

3A03.Y Other and unspecified nutritional or metabolic anaemia

Haemolytic anaemias (3A10-3A4Z)

A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors leading to premature haemolysis of red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal breakdown of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

Congenital haemolytic anaemia (3A10-3A1Y)

A disease caused by determinants arising in the antenatal period . This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

Coded Elsewhere: Haemolytic disease of fetus or newborn (KA84)

3A10 Hereditary haemolytic anaemia

3A10.0 Haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies

This is a form of anaemia due to haemolysis, the abnormal breakdown of red blood cells (RBCs), either in the blood vessels (intravascular haemolysis) or elsewhere in the human body (extravascular). This diagnosis is due to is a process that generates NADPH and pentoses (5-carbon sugars) and glutathione metabolism anomalies.

3A10.00 Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency

Glucose-6-phosphate dehydrogenase (G6PD) deficiency is the most common hereditary erythrocyte enzyme deficiency that can manifest with severe neonatal jaundice which can lead to serious neurological consequences, or, most often, with acute haemolytic anaemia following ingestion of certain foods (fava beans), common drugs (some antimalaria drugs, sulphamides, analgesics), or in the course of an infection, in otherwise asymptomatic individuals.

3A10.0Y Other specified haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies

3A10.0Z Haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies, unspecified

3A10.1 Haemolytic anaemia due to adenosine deaminase excess

3A10.2 Hereditary elliptocytosis

Hereditary elliptocytosis is a group of rare conditions caused by abnormalities in the red cell cytoskeleton and marked by the presence on blood smears of numerous elliptical red blood cells, called elliptocytes. Clinical presentations are highly heterogeneous ranging from asymptomatic forms to more severe forms associated with variable anaemia, from moderate to severe and with pyropoikilocytosis including fragmented red cells, microelliptocytes and microspherocytes.

3A10.3 Familial pseudohyperkalaemia

A disease caused by a genetically inherited mutation. This disease is characterised by a temperature-dependent defect in red cell membrane permeability to potassium that leads to high in vitro potassium levels in samples stored below 37°C leading to elevated potassium levels in the blood that does not reflect the true potassium level. Confirmation is by identification of genetic mutation through genetic testing.

3A10.Y Other specified hereditary haemolytic anaemia

3A10.Z Hereditary haemolytic anaemia, unspecified

3A1Y **Other specified congenital haemolytic anaemia**

Acquired haemolytic anaemia (3A20-3A2Z)

A disease characterised by premature destruction of red blood cells arising after birth. This disease is further characterised by low levels of red blood cells in the body due to abnormal destruction of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

3A20 **Acquired haemolytic anaemia, immune**

A condition characterised by antibodies that are directed against red blood cells in an autoimmune reaction leading to low levels of red blood cells. This condition may present with pallor, fatigue, shortness of breath. Confirmation is by identification of antibodies in a blood sample and positive Coombs test result.

3A20.0 Autoimmune haemolytic anaemia, warm type

Autoimmune haemolytic anaemia (AIHA) is an autoimmune disorder in which various types of auto-antibodies are directed against red blood cells causing their survival to be shortened and resulting in haemolytic anaemia. AIHA can be primary (idiopathic), secondary to infection or associated with diseases such as B-cell lymphomas, other systemic or organ-specific autoimmune diseases, Hodgkin's disease, hepatitis or primary immunodeficiencies, or, in the case of drug-induced AIHA, caused by a reaction to drugs.

Exclusions: Evans syndrome (3A20.5)

Haemolytic disease of fetus or newborn (KA84)

Paroxysmal cold haemoglobinuria (3A20.3)

3A20.1 Autoimmune haemolytic anaemia, cold type

Cold autoimmune haemolytic anaemia comprises two types of autoimmune haemolytic anaemia (AIHA) defined by the presence of cold autoantibodies (autoantibodies which are active at temperatures below 30°C): cold agglutinin disease (CAD), which is the more common, and paroxysmal cold haemoglobinuria (PCH). CAD is more common in people over the age of 55 years, while PCH typically presents in young children. CAD is caused by IgM autoantibodies while PCH is caused by an IgG immunoglobulin.

Exclusions: Immune thrombocytopenic purpura (3B64.10)

Haemolytic disease of fetus or newborn (KA84)

3A20.2 Autoimmune haemolytic anaemia, mixed type, cold and warm

Mixed autoimmune haemolytic anaemia is a type of autoimmune haemolytic anaemia (AIHA) defined by the presence of both warm and cold autoantibodies, which have a deleterious effect on red blood cells at either body temperature or at lower temperatures.

3A20.3 Paroxysmal cold haemoglobinuria

Paroxysmal cold hemoglobinuria is a very rare subtype of autoimmune haemolytic anaemia (AIHA), caused by the presence of cold-reacting autoantibodies in the blood and characterised by the sudden presence of hemoglobinuria, typically after exposure to cold temperatures. PCH is thought to account for at most 2-10% of cases of AIHA.

3A20.4 Alloimmune haemolytic anaemia

A disease caused by determinants such as a blood transfusion that lead to an immune response directed against the person's own red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

Exclusions: Haemolytic disease of fetus or newborn (KA84)

3A20.5 Evans syndrome

Evans syndrome is characterised by the association of autoimmune haemolytic anaemia with another haematological anomaly. The thrombocytopaenia may precede, occur concurrently with, or secondary to the autoimmune haemolytic anaemia.

3A20.Y Other specified acquired haemolytic anaemia, immune

3A21 Acquired haemolytic anaemia, non-immune

A disease caused by determinants such as infection, toxic chemicals, drugs and trauma arising after birth. This disease is characterised by haemolysis of red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of decreased red blood cell count in a blood sample and negative Coombs test result.

3A21.0 Paroxysmal nocturnal haemoglobinuria

Paroxysmal nocturnal hemoglobinuria (PNH) is an acquired clonal hematopoietic stem cell disorder characterised by corpuscular haemolytic anaemia, bone marrow failure and frequent thrombotic events.

Exclusions: haemoglobinuria NOS (MF94)

Aplastic anaemia with paroxysmal nocturnal haemoglobulinuria (3A70.1)

3A21.1 Microangiopathic haemolytic anaemia

This is a microangiopathic subgroup of haemolytic anaemia (loss of red blood cells through destruction) caused by factors in the small blood vessels. It is identified by the finding of anaemia and schistocytes on microscopy of the blood film.

3A21.2 Haemolytic uraemic syndrome

Exclusions: Hereditary haemolytic uraemic syndrome (3A10)

3A21.Y Other specified acquired haemolytic anaemia, non-immune

3A2Z Acquired haemolytic anaemia, unspecified

3A4Z Haemolytic anaemias, unspecified

3A50 Thalassaemias

A disease caused by genetically inherited autosomal recessive mutations leading to abnormal production of haemoglobin. This disease is characterised by destruction of red blood cells leading to anaemia and abnormal production of haemoglobin. This disease may present with pallor, jaundice, iron overload, fatigue, or shortness of breath. Confirmation is by identification of mutations through genetic testing.

3A50.0 Alpha thalassaemia

Alpha-thalassemia is an inherited haemoglobinopathy characterised by impaired synthesis of alpha-globin chains leading to a variable clinical picture depending on the number of affected alleles, and encompassing the alpha thalassaemia trait, haemoglobin H disease (HbH) and Bart's hydrops fetalis.

Exclusions: Hydrops fetalis due to haemolytic disease (KA85)

3A50.00 Mild alpha thalassaemia diseases

A disease caused by genetically inherited factors affecting the alpha chain of the haemoglobin molecule. This disease is characterised by structural abnormalities of the haemoglobin molecule. This disease may present with mild anaemia: pallor, fatigue, shortness of breath. Confirmation is by identification of changes to the alpha chain by genetic testing.

3A50.01 Thalassaemic alpha-chain variants

3A50.02 Haemoglobin H disease (– α/– – included)

Haemoglobin H (HbH) disease is a moderate to severe form of alpha-thalassemia characterised by pronounced microcytic hypochromic haemolytic anaemia.

3A50.03 Homozygous or compound heterozygous alpha0 thalassaemia

Hb Bart's hydrops fetalis is the most severe form of alpha-thalassemia and is almost always lethal. It is characterised by fetal onset of generalised oedema, pleural and pericardial effusions, and severe hypochromic anaemia.

3A50.0Y Other specified alpha thalassaemia

3A50.0Z Alpha thalassaemia, unspecified

3A50.1 Alpha thalassaemia related syndromes

Alpha-thalassemia-related diseases refers to a group of diseases characterised by alpha-thalassemia and an associated disorder. Three conditions are included in this group: alpha-thalassemia-intellectual deficit syndrome, X-linked (or ATR-X syndrome), alpha-thalassemia-intellectual deficit syndrome and alpha-thalassemia-myelodysplastic disease or ATMDS.

3A50.2 Beta thalassaemia

Beta-thalassemia (BT) is a haemoglobinopathy characterised by deficiency (Beta+) or absence (Beta0) of synthesis of the beta globin chains of haemoglobin (Hb). Three main types of BT have been described: minor, intermedia and major with clinical presentation ranging from asymptomatic forms to microcytic anaemia and splenomegaly due to defective erythropoiesis and haemolysis.

3A50.3 Delta, delta-beta or gamma-delta-beta thalassaemia

Delta-beta-thalassemia is a form of beta-thalassemia characterised by decreased or absent synthesis of the delta- and beta-globin chains with a compensatory increase in expression of fetal gamma-chain synthesis.

3A50.4 Hereditary persistence of fetal haemoglobin

Hereditary persistence of fetal haemoglobin (HPFH) associated with beta-thalassaemia is a haemoglobinopathy characterised by high haemoglobin (Hb)F levels and an increased number of fetal-Hb-containing-cells. The association of HPFH with beta-thalassaemia mitigates the clinical manifestations which vary from a normal state to beta-thalassaemia intermedia.

3A50.Y Other specified thalassaemias

3A50.Z Thalassaemias, unspecified

3A51 Sickle cell disorders or other haemoglobinopathies

Any disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

Coded Elsewhere: Osteonecrosis due to haemoglobinopathy (FB81.4)

Other sickle-cell disorders with retinopathy (9B71.Y)

3A51.0 Sickle cell trait

A disease caused by genetic inheritance of one abnormal allele of the haemoglobin gene. This disease does not display the severe symptoms of sickle cell disease that occurs in homozygous individuals. Confirmation is by identification of mutation through genetic testing.

3A51.1 Sickle cell disease without crisis

A disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

3A51.2 Sickle cell disease with crisis

Sickle cell crisis occurs when the sickle cells block blood flow, thus decreasing oxygen delivery to the tissues. This results in intense to severe pain in the extremities, lower back, abdomen, and chest. A crisis can be brought on by illness, stress, dehydration, exposure to temperature changes or high altitudes.

Inclusions: Hb-SS disease with crisis

3A51.3 Compound heterozygous sickling disorders without crisis

A disease caused by genetic inheritance of two heterozygous recessive alleles of the haemoglobin gene leading to abnormal formation of haemoglobin molecule. This disease is characterised by rigid, sickle shaped red blood cells. Confirmation is by identification of mutations through genetic testing.

3A51.4 Compound heterozygous sickling disorders with crisis

Compound heterozygous sickling disorders with crisis may present with acute chest syndrome, splenic sequestration, haemolytic crisis, and pain.

3A51.5 Haemoglobin C disease

A disease caused by the bi-parental gene that encodes for haemoglobin C. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin C gene by genetic testing.

Exclusions: Hereditary persistence of fetal haemoglobin (3A50.4)

3A51.6 Haemoglobin D disease

Haemoglobin D (Hb D) disease is characterised by mild haemolytic anaemia and mild to moderate splenomegaly. Prevalence is unknown. Heterozygous forms of Hb D are clinically silent. Molecular testing can be useful to distinguish Hb D homozygosity from cases of heterozygous Hb D in association with beta-(0) thalassaemia.

3A51.7 High affinity haemoglobin

A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to high oxygen affinity haemoglobin. This disease is characterised by abnormalities the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues.

3A51.8 Low affinity haemoglobin

A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to low oxygen affinity haemoglobin. This disease is characterised by abnormalities the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities.

3A51.9 Haemoglobin O disease

A disease caused by the bi-parental inheritance of the gene that encodes for haemoglobin O. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin O gene by genetic testing.

3A51.A Haemoglobin E disease

Haemoglobin E disease is characterised by the synthesis of an abnormal haemoglobin called haemoglobin E (HbE), instead of the normal haemoglobin A (HbA). Subjects heterozygous for HbE (AE) have an asymptomatic condition with no clinical relevance, except for the risk of transmitting E/beta thalassemia if the other parent carries beta thalassemia. The severity of these E/beta thalassemia forms is very variable, the clinical picture ranging from that of beta thalassemia minor through to thalassemia intermedia to thalassemia major. Subjects homozygous for HbE (EE) are asymptomatic.

3A51.B Haemoglobin C/beta thalassaemia compound heterozygosity

Haemoglobin C/beta thalassaemia is a condition resulting from coinheritance of haemoglobin C and beta thalassaemia, both beta globin genes being mutated.

3A51.Y Other specified sickle cell disorders or other haemoglobinopathies

3A51.Z Sickle cell disorders or other haemoglobinopathies, unspecified

A condition caused by determinates arising during the antenatal period, after birth or genetically inherited factors, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurs in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of abnormally formed erythrocytes in a blood sample.

3A60 **Congenital pure red cell aplasia**

A condition caused by determinants arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurs in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

3A60.0 Congenital non-inherited pure red cell aplasia

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurs in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased levels of red blood cells in a blood sample.

3A60.1 Hereditary pure red cell aplasia

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurs in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

3A60.Z Congenital pure red cell aplasia, unspecified

3A61 **Acquired pure red cell aplasia**

A condition characterised by the near absence of red blood cell precursors in bone marrow, often associated with thymomas and autoimmune disorders

Exclusions: Aplastic anaemia with paroxysmal nocturnal haemoglobulinuria (3A70.1)

3A61.0 Acute acquired pure red cell aplasia

This refers to transient (acute) and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

3A61.1 Chronic acquired pure red cell aplasia

This refers to a chronic and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

3A61.Y Other specified acquired pure red cell aplasia

3A61.Z Acquired pure red cell aplasia, unspecified

3A6Z **Pure red cell aplasia, unspecified**

3A70 **Aplastic anaemia**

A disease caused by determinants arising after birth, in the antenatal period or genetically inherited factors leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, and platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

Inclusions: Medullary hypoplasia

Panmyelophthisis

3A70.0 Congenital aplastic anaemia

A disease caused by determinants in the antenatal period leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

Inclusions: familial hypoplastic anaemia

Constitutional medullar aplasia

Exclusions: Congenital amegakaryocytic thrombocytopenia (3B64.01)

Coded Elsewhere: Congenital hypoplastic anaemia (KA8C)

Noonan syndrome (LD2F.15)

3A70.1 Acquired aplastic anaemias

A condition occurring secondary to other disorders or via an auto-immune response directed to the bone marrow arising after birth. This disease is characterised by an almost complete absence of hematopoietic stem cells resulting in low levels of red and white blood cells and platelets. This condition may present with fatigue, chronic infections, dizziness, weakness, headaches, and episodes of bleeding, usually in the skin and mucous membranes.

Inclusions: Acquired medullar aplasia

Coded Elsewhere: Paroxysmal nocturnal haemoglobinuria (3A21.0)

Myelofibrosis with myeloid metaplasia (2A20.2)

3A70.10 Drug-induced aplastic anaemia

A disease caused by drug intake. This disease is characterised by inability of stem cells to generate new mature cells leading to low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising/bleeding.

3A70.11 Aplastic anaemia due to other external agents

3A70.12 Idiopathic aplastic anaemia

3A70.1Y Other specified acquired aplastic anaemias

3A70.1Z Acquired aplastic anaemias, unspecified

3A70.Z Aplastic anaemia, unspecified

3A71 Anaemia due to chronic disease

A disease caused by chronic diseases such as chronic infection. This disease is characterised by inflammatory responses targeted at red blood cells leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

Coding Note: Code also the causing condition

3A71.0 Anaemia in neoplastic disease

A disease caused by chronic neoplastic diseases. This disease is characterised by inflammatory responses targeted at red blood cell leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample

Coding Note: Code also the causing condition

3A71.1 Anaemia in chronic infectious diseases

A disease caused by chronic infectious diseases leading to decreased levels of red blood cells in the blood. This disease is characterised by a low red blood cell count in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

Coding Note: Code also the causing condition

3A71.2 Anaemia in chronic kidney disease

A disease caused by chronic kidney disease. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.

Coding Note: Code also the causing condition

3A71.Y Anaemia due to other specified chronic disease

Coding Note: Code also the causing condition

3A71.Z Anaemia due to chronic disease, unspecified

3A72 Sideroblastic anaemia

Sideroblastic anaemias are a group of disorders in which haemoglobin is insufficiently synthesized, because of defective use of iron (although plasmatic iron levels may be normal or elevated). They are said to be sideroblastic because of the presence of ringed sideroblasts in the blood due to accumulated ferritin in mitochondria. Anaemias may be microcytic hypochrome (in thalassemia and hereditary sideroblastic anaemias), or macrocytic (in idiopathic acquired sideroblastic anaemias).

3A72.0 **Congenital sideroblastic anaemias**

A disease caused by determinants arising in the antenatal period leading to the production of ringed sideroblasts; abnormal nucleated erythroblasts. This disease is characterised by the inability of to incorporate haemoglobin, which red blood cells need to transport oxygen efficiently. This disease may present with pallor, fatigue, dizziness, and enlarged spleen and liver, heart disease, liver damage, or kidney failure.

3A72.00 Hereditary sideroblastic anaemias

Inclusions: Sex-linked hypochromic sideroblastic anaemia

3A72.01 Hereditary syndromic sideroblastic anaemia

Coded Elsewhere: Thiamine-responsive megaloblastic anaemia syndrome (5C63.Y)

3A72.0Y Other specified congenital sideroblastic anaemias

3A72.0Z Congenital sideroblastic anaemias, unspecified

3A72.1 **Acquired sideroblastic anaemias**

A disease caused by determinants arising after birth such as myelodysplastic syndromes, antimicrobials, pyridoxine deficiency, lead poisoning, or copper deficiency. Zinc can indirectly cause sideroblastic anaemia by decreasing absorption and increasing excretion of copper. This disease is characterised by the inability of to incorporate haemoglobin, which red blood cells need to transport oxygen efficiently. This disease may present with pallor, fatigue, dizziness, and enlarged spleen and liver, heart disease, liver damage, or kidney failure.

Coded Elsewhere: Refractory anaemia with ring sideroblasts (2A33)

3A72.Z **Sideroblastic anaemia, unspecified**

3A73 Congenital dyserythropoietic anaemia

Congenital dyserythropoietic anaemias (CDA) result from diverse erythropoietic disorders; they lead to the defective production of red blood cells (RBC) and often mild haemolysis that attests to a qualitative defect of these RBC released into the circulation. Three forms of CDA have been characterised: types I, II and III. The shared symptoms include anaemia of variable severity, intermittent jaundice, splenomegaly and hepatomegaly.

Exclusions: Blackfan-Diamond syndrome (3A60.1)

Di Guglielmo disease (2A60.35)

Polycythaemia (3A80-3A8Z)

Coded Elsewhere: Polycythaemia vera (2A20.4)

Polycythaemia neonatorum (KA8A)

3A80 **Congenital polycythaemia**

A disease caused by determinants occurring in the antenatal period leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. This disease may present with headaches, blurred vision, red skin, tiredness, high blood pressure, dizziness, periods of confusion, bleeding problems gout or itchy skin. Confirmation is by identification of increased levels of red blood cells in a blood sample.

Coded Elsewhere: Polycythaemia neonatorum (KA8A)

3A80.0 Primary inherited erythrocytosis

A disease caused by genetically inherited factors leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. Confirmation is by identification of mutations by genetic testing.

3A80.Y Other specified congenital polycythaemia

3A80.Z Congenital polycythaemia, unspecified

3A81 **Acquired polycythaemia**

Secondary polycythaemia is acquired and caused by either natural or artificial increases in the production of erythropoietin, hence an increased production of erythrocytes.

3A81.0 Polycythaemia due to hypoxia, including high altitude

3A81.1 Polycythaemia due to over-transfusion or blood doping

3A81.2 Relative polycythaemia

A disease caused by loss of body fluids leading to apparent increased levels of red blood cells in the blood. This disease may present with headache, vertigo, abnormally enlarged spleen or liver, high blood pressure, or formation of blood clots. Confirmation is by identification of relative blood cell counts in a blood sample.

3A81.Y Other specified acquired polycythaemia

3A81.Z Acquired polycythaemia, unspecified

3A8Z **Polycythaemia, unspecified**

3A90 **Anaemia due to acute disease**

Exclusions: Acute posthaemorrhagic anaemia (3A94)

3A91 **Congenital methaemoglobinaemia**

A disease caused by determinants in the antenatal period leading to lack of the enzyme cytochrome b5 reductase. This disease is characterised by elevated levels of methemoglobin within the blood leading to haemoglobin ineffectively releasing oxygen to body tissues. This disease may present with shortness of breath, cyanosis, headache, fatigue, exercise intolerance, dizziness and loss of consciousness. Confirmation is by identification of mutation by genetic testing.

3A92 **Hereditary methaemoglobinaemia**

Hereditary methemoglobinemia (HM) is a rare red cell disorder classified principally into two clinical phenotypes: autosomal recessive congenital (or hereditary) methemoglobinemia types I and II (RCM/RHM type 1; RCM/RHM type 2). In RCM type 1, well-tolerated cyanosis from birth is the only symptom. RCM type 2, with global loss of Cb5R function, is much more severe; the cyanosis is accompanied by neurological dysfunction (with intellectual deficit, microcephaly, growth retardation, opisthotonus, strabismus and hypertonia), which usually becomes evident during the first four months of life.

3A93 **Acquired methaemoglobinaemia**

3A94 **Acute posthaemorrhagic anaemia**

A disease caused by blood loss such as subsequent to trauma. This disease is characterised by loss of blood from the body leading to low levels of red blood cells/blood in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

Exclusions: congenital anaemia from fetal blood loss (KA8C)

Anaemia due to acute disease (3A90)

3A9Y **Other specified anaemias or erythrocyte disorders**

3A9Z **Anaemias or other erythrocyte disorders, unspecified**

Coagulation defects, purpura or other haemorrhagic or related conditions (3B10-3B6Z)

A condition caused by determinants arising during the antenatal period, after birth or by genetically inherited factors, leading to coagulation defects. This condition is characterised by increased bruising and bleeding.

Exclusions: Postpartum coagulation defects (JA43.3)

Coagulation defects (3B10-3B4Z)

Congenital or constitutional haemorrhagic condition (3B10-3B1Z)

A condition caused by determinants arising during the antenatal period or genetically inherited factors, leading to defects in clotting mechanisms or abnormalities causing structural flaws in the blood vessels. This disease is characterised by spontaneous bleeding or bruising.

Coded Elsewhere: Congenital non-inherited haemorrhagic condition

3B10 **Hereditary factor VIII deficiency**

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

3B10.0 Haemophilia A

Haemophilia A is the most common form of haemophilia characterised by spontaneous or prolonged haemorrhages due to factor VIII deficiency. Depending on the extent of the factor VIII deficiency, it can be severe (biological activity of factor VIII below 1%), moderately severe (activity of factor VIII between 1% and 5%), or mild (activity of factor VIII between 5 and 40%).

Exclusions: factor VIII deficiency with vascular defect (3B12)

3B10.1 Hereditary factor VIII deficiency with anti-factor VIII inhibitor

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease also causes anti-factor VIII inhibitor antibodies to be produced when receiving transfusions. Anti-factor VIII inhibitor antibodies develop as the body recognises the factor VIII as foreign, therefore deeming factor VIII infusions ineffective. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

3B10.Y Other specified hereditary factor VIII deficiency

3B10.Z Hereditary factor VIII deficiency, unspecified

3B11 **Hereditary factor IX deficiency**

A disease caused by a genetically inherited X-linked recessive trait leading to a defective gene located on the X chromosome. This disease is characterised by low levels of the protein factor IX in the body leading to increased haemorrhaging and bruising due to clotting abnormalities. Confirmation is by identification of recessive trait by genetic testing.

3B11.0 **Haemophilia B**

Haemophilia B is a form of haemophilia characterised by spontaneous or prolonged haemorrhages due to factor IX deficiency. Depending on the extent of the factor IX deficiency, it can be severe (biological activity of factor IX below 1%), moderately severe (activity of factor IX between 1% and 5%), or mild (activity of factor IX between 5 and 40%).

Inclusions: PTC - [plasma thromboplastin component] deficiency

3B11.Y **Other specified hereditary factor IX deficiency**

3B11.Z **Hereditary factor IX deficiency, unspecified**

3B12 **Von Willebrand disease**

A disease caused by inherited genetic mutations. This disease is characterised by quantitative, structural or function abnormalities of Von Willebrand factor leading to abnormalities in coagulation of the blood. This disease may present with prolonged bleeding, easy bruising or, bleeding gums. Confirmation is by identification of mutation through genetic testing.

Inclusions: Factor VIII deficiency with vascular defect

Vascular haemophilia

Angiohaemophilia

Exclusions: factor VIII deficiency with functional defect (3B10)

factor VIII deficiency NOS (3B10)

Acquired von Willebrand disease or syndrome (3B20-3B2Y)

3B13 **Haemophilia C**

A disease caused by genetically inherited mutations. This disease is characterised by decreased levels of factor XI leading to abnormalities in coagulation of the blood. This disease may present with prolonged bleeding, easy bruising or, bleeding gums. Confirmation is by identification of mutation through genetic testing.

3B14 **Other inherited coagulation factor deficiency with bleeding tendency**

Any disease caused by genetically inherited mutations leading to lack of coagulation factors in the blood not elsewhere classified. These diseases are characterised by increased haemorrhaging and bruising as the blood cannot clot properly to control bleeding. Confirmation is identification of mutations by genetic testing.

3B14.0 **Hereditary deficiency of factor I**

Congenital deficiencies of fibrinogen are coagulation disorders characterised by bleeding symptoms ranging from mild to severe resulting from reduced quantity and/or quality of circulating fibrinogen. Afibrinogenaemia (complete absence of fibrinogen) and hypofibrinogenaemia (reduced plasma fibrinogen concentration) correspond to quantitative anomalies of fibrinogen while dysfibrinogenaemia corresponds to a functional anomaly of fibrinogen. Hypo- and dysfibrinogenaemia may be frequently combined (hypodysfibrinogenaemia).

3B14.1 **Hereditary factor X deficiency**

Congenital factor X deficiency is an inherited bleeding disorder with a decreased antigen and/or activity of factor X (FX) and characterised by mild to severe bleeding symptoms.

3B14.2 **Combined deficiency of vitamin K-dependent clotting factors**

Hereditary combined vitamin K-dependent clotting factors deficiency (VKCFD) is a congenital bleeding disorder resulting from variably decreased levels of coagulation factors II, VII, IX and X, as well as natural anticoagulants protein C, protein S and protein Z.

3B14.Z **Other inherited coagulation factor deficiency with bleeding tendency, unspecified**

3B15 **Inherited coagulation factor deficiency without bleeding tendency**

A disease caused by a genetically inherited mutation leading to decreased levels of coagulation factor. This disease is characterised by decreased levels of coagulation factor without leading to increased haemorrhaging. Confirmation is by identification of decreased levels of coagulation factor in a blood sample.

3B1Z **Congenital or constitutional haemorrhagic condition, unspecified**

Haemorrhagic diseases due to acquired coagulation factor defects (3B20-3B2Y)

Any disease caused by determinants arising after birth. These diseases are characterised by abnormal coagulation of the blood.

Exclusions: vitamin K deficiency of newborn (KA8F.0)

3B20 **Disseminated intravascular coagulation**

A disorder that is characterised by the systemic intravascular activation of the coagulation system, simultaneously leading to intravascular thrombi, compromising an adequate blood supply to the organs, and to bleeding as the consequence of consumption of platelets and coagulation factors. It may be provoked by a wide range of disorders including infections, inflammatory disorders and malignancy.

Coded Elsewhere: Disseminated intravascular coagulation of fetus or newborn (KA88)

3B21 **Haemorrhagic disorder due to circulating anticoagulants and coagulation factors**

A disease caused by anticoagulants present in the body that prevent the blood from clotting normally. This disease is characterised by abnormalities in blood clotting. This disease may present with prolonged bleeding, easy bruising or, bleeding gums. Confirmation is by identification of anticoagulants present in a blood sample.

Exclusions: long-term use of anticoagulants without haemorrhage (QC48.0)

3B21.0 Haemorrhage due to thrombin inhibitor other than heparin

A disease caused by any thrombin inhibitors other than heparin that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of thrombin inhibitors in a blood sample.

3B21.1 Haemorrhage due to factor Xa inhibitor

A disease caused by factor Xa inhibitor that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of factor Xa inhibitor in a blood sample.

3B21.Y Haemorrhagic disorder due to other specified circulating anticoagulants

3B21.Z Haemorrhagic disorder due to unspecified circulating anticoagulants

3B22 Acquired haemophilia

Acquired haemophilia is a rare haemorrhagic disease caused by production of anti-factor VIII antibodies and is sometimes associated with other autoimmune disorders, cancers lymphoproliferative syndromes and multiple transfusions during the postpartum period.

3B2Y Other specified haemorrhagic diseases due to acquired coagulation factor defects

3B4Z Coagulation defects, unspecified

Fibrinolytic defects (3B50-3B51)

A disease caused by determinants arising during the antenatal period, after birth or genetically inherited factors, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

3B50 Inherited fibrinolytic defects

A disease caused by genetically inherited mutations affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

Coded Elsewhere: Hypoplasminogenaemia (DA0D.3)

3B50.0 Congenital alpha-2 antiplasmin deficiency

3B50.1 Congenital plasminogen activator inhibitor type 1 deficiency

Congenital plasminogen activator inhibitor type 1(PAI-1) deficiency is a disorder that causes premature lysis of haemostatic clots and a moderate bleeding syndrome. Spontaneous bleeding is rarely observed, whereas moderate haemorrhages of the knees, elbows, nose and gingiva are usually triggered by mild trauma. However, menstrual bleeding may be severe and a prolonged bleeding after surgery is common. The PAI-1 deficiency may be qualitative or quantitative, total or partial.

3B50.Y Other specified inherited fibrinolytic defects

3B50.Z **Inherited fibrinolytic defects, unspecified**

3B51 Acquired fibrinolytic defects

A disease caused by determinates arising after birth, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the Fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

3B60 Non-thrombocytopenic purpura

A descriptive term for purpura caused by determinants other than low platelet count. This should be used for coding only when a more precise diagnosis is not available.

Exclusions:

- Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)
- Antiphospholipid syndrome (4A45)
- Drug-associated immune complex vasculitis (4A85.03)
- Immune complex small vessel vasculitis (4A44.9)
- Leukocytoclastic vasculitis (4A44.B)
- Purpura or bruising due to vascular fragility (EE40.32)
- Thrombotic thrombocytopenic purpura (3B64.14)
- Traumatic purpura (EF31)

3B60.0 **Hereditary vascular purpura**

3B60.1 **Acquired vascular purpura**

Purpura resulting from vascular factors rather than from abnormalities in the blood such as dysproteinaemias and disorders of platelets and coagulation.

Exclusions:

- Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)
- Antiphospholipid syndrome (4A45)
- Capillaritis (EF40.0)
- Drug-associated immune complex vasculitis (4A85.03)
- IgA vasculitis (4A44.92)
- Leukocytoclastic vasculitis (4A44.B)
- Purpura or bruising due to vascular fragility (EE40.32)
- Thrombotic thrombocytopenic purpura (3B64.14)
- Traumatic purpura (EF31)

3B61 Thrombophilia

A disease caused by determinants arising after birth or genetically inherited factors leading to abnormalities in blood. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.

3B61.0 **Hereditary thrombophilia**

A disease caused by hereditary factors leading to abnormalities in blood. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.

Inclusions: antithrombin deficiency

3B61.00 Hyperhomocysteinaemia

A disease caused by deficiencies of vitamin B6, folic acid, or vitamin B12. Genetic defects in 5-MTHF reductase can consequently lead to hyperhomocysteinaemia. This disease is characterised by abnormally high level of homocysteine in the blood. This disease may present with cardiovascular disease, thrombosis, schizophrenia and osteoporosis. Confirmation is by identification of deficiency in a blood sample.

3B61.0Y Other specified hereditary thrombophilia

3B61.1 **Acquired thrombophilia**

A disease caused by determinants arising after birth. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.

Coded Elsewhere: Antiphospholipid syndrome (4A45)

3B61.Y **Other specified thrombophilia**

3B61.Z **Thrombophilia, unspecified**

3B62 Qualitative platelet defects

A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors. This disease is characterised by abnormalities in coagulation of the blood due to defective platelets. This condition may present with easy bruising, prolonged bleeding or, bleeding gums. Confirmation is by identification of decreased platelets in a blood sample.

Inclusions: Thrombocytopathy

Exclusions: Von Willebrand disease (3B12)

3B62.0 **Inherited qualitative platelet defects**

A disease caused by genetically inherited mutations leading to abnormalities in platelets. This disease is characterised by abnormal platelet formation or function. Confirmation is by identification of mutations by genetic testing.

Coded Elsewhere: Dense granule disease (3B62.3)

Alpha-delta dense granule deficiency (3B62.4)

3B62.00 Alpha-granule diseases

A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the alpha granules in platelets leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of platelet defects in a blood sample.

3B62.01 Inherited giant platelet disorder

A disease caused by genetically inherited mutations. This disease is characterised by abnormally large platelets, low platelet count and a bleeding tendency. Confirmation is by identification of mutations through genetic testing.

Coded Elsewhere: MYH9 macrothrombocytopenia syndromes (3B64.01)

3B62.0Y Other specified inherited qualitative platelet defects

3B62.0Z Inherited qualitative platelet defects, unspecified

3B62.1 Bleeding diathesis due to thromboxane synthesis deficiency

A disease caused by thromboxane synthesis deficiency. This disease is characterised by low levels of eicosanoids (lipids), abnormalities in coagulation leading to haemorrhaging. Confirmation is by identification of low levels of eicosanoids in a blood sample.

3B62.2 Isolated thrombocytopenia

3B62.3 Dense granule disease

A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the dense granules in platelets leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of platelet defects in a blood sample.

Coded Elsewhere: Hermansky-Pudlak syndrome (EC23.20)

Chédiak-Higashi syndrome (EC23.20)

3B62.4 Alpha-delta dense granule deficiency

A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the alpha delta dense granules in platelets, leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of low levels of alpha delta dense granules in a blood sample.

3B62.5 Haemophagocytic syndrome associated with infection

This is an uncommon hematologic disorder that, typically, clinically manifests as fever, hepatosplenomegaly, lymphadenopathy, jaundice and rash, with laboratory findings of histiocytosis, and the pathologic finding of haemophagocytosis, infection-associated.

3B62.Y Other specified qualitative platelet defects

3B62.Z **Qualitative platelet defects, unspecified**

3B63 **Thrombocytosis**

A disease caused by essential thrombocytosis or other myelo-proliferative disorders such as chronic myelogenous leukaemia, polycythaemia, myelofibrosis. This disease can also have secondary causes such as inflammation, surgery, hyposplenism, Splenectomy, asplenia, iron deficiency anaemia or haemorrhage. This disease is characterised by elevated platelet count in the blood. Confirmation is by identification of increased platelet count in a blood sample.

3B63.0 **Congenital thrombocytosis**

Familial thrombocytosis is a type of thrombocytosis, a sustained elevation of platelet numbers, which affects the platelet/megakaryocyte lineage and may create a tendency for thrombosis and haemorrhage but does not cause myeloproliferation.

Inclusions: Hereditary thrombocytosis

Exclusions: Essential thrombocythemia (3B63.1)

3B63.1 **Acquired thrombocytosis**

A chronic myeloproliferative neoplasm that involves primarily the megakaryocytic lineage. It is characterised by sustained thrombocytosis in the blood, increased numbers of large, mature megakaryocytes in the bone marrow, and episodes of thrombosis and/or haemorrhage. Progression to a post -essential thrombocythaemia myelofibrosis stage or transformation to acute myeloid leukaemia is rarely observed.

Inclusions: Idiopathic haemorrhagic thrombocythaemia

3B63.10 Secondary thrombocytosis

Coding Note: Code also the causing condition

3B63.1Y Other specified acquired thrombocytosis

3B63.1Z Acquired thrombocytosis, unspecified

3B63.Y **Other specified thrombocytosis**

3B63.Z **Thrombocytosis, unspecified**

3B64 **Thrombocytopenia**

This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.

Coded Elsewhere: Isolated thrombocytopenia (3B62.2)

3B64.0 **Congenital thrombocytopenia**

A disease caused by determinants arising during the antenatal period leading to low platelet count. This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of a decreased platelet count in a blood sample.

3B64.00 Congenital non-inherited thrombocytopenia

Coded Elsewhere: Transient neonatal thrombocytopaenia (KA89)

3B64.01 Hereditary thrombocytopenia

A disease caused by a genetically inherited mutation leading to decreased platelet count. This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.

Coded Elsewhere: Thrombocytopaenia - absent radius (LD2F.1Y)

Familial platelet syndrome with predisposition to acute myelogenous leukaemia (3B62.3)

Congenital thrombotic thrombocytopenic purpura due to ADAMTS-13 deficiency (3B64.14)

Macrothrombocytopenia with mitral valve insufficiency (3B62.01)

3B64.0Z Congenital thrombocytopenia, unspecified

3B64.1 **Acquired thrombocytopenia**

A disease caused by determinants arising after birth, leading to low platelet count. This disease is characterised by low levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.

3B64.10 Immune thrombocytopenic purpura

Immune thrombocytopenic purpura (or immune thrombocytopenia; ITP) is an autoimmune coagulation disorder characterised by isolated thrombocytopenia (a platelet count <100,000/microL), in the absence of any underlying disorder that may be associated with thrombocytopenia.

Coded Elsewhere: Evans syndrome (3A20.5)

3B64.11 Secondary thrombocytopenic purpura

This disease is characterised by a relative decrease in levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelets in a blood sample.

Coding Note: Code also the causing condition

3B64.12 Drug-induced thrombocytopenic purpura

Thrombocytopenic purpura attributable to drug toxicity (e.g. cytotoxic chemotherapeutic or immunosuppressive agents) or to an idiosyncratic drug-associated allergic thrombocytopenia (e.g. quinine, thiazides).

3B64.13 Alloimmune thrombocytopenia

A disease caused by determinants such as a blood transfusion that lead to an immune response to the foreign antigens. This disease is characterised by low levels of platelets in the body due to an immune reactive response to the foreign platelet antigens. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count and presence of autoantibodies in a blood sample.

3B64.14 Thrombotic thrombocytopenic purpura

This condition is idiopathic. This condition is characterised by abnormality of blood coagulation causing extensive microscopic clots to form in the small blood vessels throughout the body resulting in low platelet count. This condition may present with seizures, hemiplegia, paresthesias, visual disturbance, and aphasia or anaemia. Confirmation is by identification of thromboses.

3B64.1Y Other specified acquired thrombocytopenia

3B64.Z **Thrombocytopenia, unspecified**

3B65 **Thrombotic microangiopathy, not elsewhere classified**

Thrombotic microangiopathies are microvascular occlusive disorders characterised by systemic or intrarenal aggregation of platelets, thrombocytopenia, and mechanical injury to erythrocytes. Thrombotic thrombocytopenic purpura (TTP) and haemolytic–uremic syndrome (HUS) represent a spectrum of thrombotic microangiopathies. In TTP, systemic microvascular aggregation of platelets causes ischemia in the brain and other organs. In HUS, platelet–fibrin thrombi predominantly occlude the renal circulation.

Coded Elsewhere: Thrombotic thrombocytopenic purpura (3B64.14)

Haemolytic uraemic syndrome (3A21.2)

Methylcobalamin deficiency type cbl G (5C50.B)

Hereditary haemolytic uraemic syndrome (3A10.Y)

3B6Y **Other specified coagulation defects, purpura or other haemorrhagic or related conditions**

3B6Z **Coagulation defects, purpura or other haemorrhagic or related conditions, unspecified**

Diseases of spleen (3B80-3B8Z)

3B80 **Congenital disorders of spleen**

Any condition caused by a failure of the spleen to correctly develop in the antenatal period.

Coded Elsewhere: Structural developmental anomalies of spleen (LB22)

3B80.0 **Splenomegaly in storage diseases**

A disease caused by storage diseases; genetically inherited metabolic disorders that result from defects in lysosomal, lipid or glycogen function, of the spleen. This disease is characterised by enlargement of the spleen. This disease may present with abdominal pain, chest pain, pallor, shortness of breath fatigue. Confirmation is through medical imaging.

3B81 Acquired disorders of spleen

Any condition caused by determinants acquired after birth, leading to dysfunction of the spleen.

Coded Elsewhere: Injury of spleen (NB91.0)

Malignant neoplasms of the spleen (2C11.Z)

3B81.0 Tumour-like conditions of spleen

Any condition caused by determinants acquired after birth, in the antenatal period or genetically inherited factors, leading to tumour-like conditions of the spleen. Confirmation is through medical imaging.

3B81.1 Postsurgical asplenia

A disease caused by underlying diseases, splenectomy or splenic rupture from trauma. This disease is characterised by absence of normal spleen function. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

3B81.2 Atrophy of spleen

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

3B81.3 Nontraumatic laceration or rupture of spleen

A disease caused by non-traumatically determinants such as infectious diseases, medical procedures such as colonoscopy, haematological diseases, medications, or pregnancy. This disease is characterised by laceration or rupturing of the spleen leading to lack of function. This disease may present with bleeding and increased susceptibility of infection. Confirmation is through medical imaging.

3B81.4 Splenosis

A diseased caused by determinants arising after birth such as physical trauma or splenectomy . This disease is characterised by autoimplantation one or more focal deposits of splenic tissue in various compartments of the body. Confirmation is through medical imaging.

3B81.5 Splenic cyst or pseudocyst

3B81.50 Pseudocyst of spleen

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by a noncancerous fluid-filled sac, pseudocysts are like cysts, but lack epithelial or endothelial cells. This disease is often asymptomatic but may present with abdominal pain, nausea and vomiting. Confirmation is through medical imaging.

3B81.51 Epithelial cyst of spleen

3B81.5Y Other specified splenic cyst

3B81.5Z Splenic cyst, unspecified

3B81.6 **Infarction of spleen**

A disease caused by determinants such as trauma, infection, or inherited factors leading to a shortage of oxygen in the spleen. This disease is characterised by death of spleen tissue and loss of function. Confirmation is by medical imaging.

Exclusions: traumatic rupture of spleen (NB91.0)

Coded Elsewhere: Neonatal haemorrhage originating in spleen (KA83.5)

3B81.7 **Infection of spleen**

Any condition of the spleen, caused by an infection with a bacterial, viral, fungal, or parasitic source.

3B81.70 Acute septic splenitis

Inclusions: septic spleen

3B81.71 Abscess of spleen

This is a collection of pus (neutrophils) that has accumulated within a tissue because of an inflammatory process in response to either an infectious process (usually caused by bacteria or parasites) or other foreign materials (e.g., splinters, bullet wounds, or injecting needles), in the spleen.

3B81.7Y Other specified infection of spleen

3B81.7Z Infection of spleen, unspecified

3B81.8 **Torsion of spleen**

A disease caused by abnormal development of splenic suspensory ligaments. This disease is characterised by twisting of the spleen leading to splenic infarction. This disease may present with abdominal pain. Confirmation is through medical imaging.

3B81.9 **Fibrosis of spleen**

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by formation of excess fibrous connective tissue leading to partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

Coding Note: Code also the causing condition

3B81.A **Perisplenitis**

A disease caused by bacterial or viral infection, parasite infestation, or cysts. This disease is characterised by inflammation of the peritoneal surface of the spleen. This disease may present with abdominal pain, susceptibility to infection and enlargement of the spleen. Confirmation is by identification of infection in a blood sample.

3B81.B **Hypersplenism**

A disease caused by determinants such as cirrhosis, malaria, tuberculosis or inflammatory disorders leading overactive spleen function. This disease is characterised by the presence of an enlarged spleen. Confirmation is by identification through medical imaging.

Exclusions: Splenomegaly, not elsewhere classified (ME10.01)

congenital splenomegaly (LB22)

3B81.C **Chronic congestive splenomegaly**

A form of exaggerated spleen function characterised by splenic enlargement secondary to splenic vein thrombosis and/or portal hypertension

3B81.Y **Other specified acquired disorders of spleen**

3B8Z **Diseases of spleen, unspecified**

3C0Y **Other specified diseases of the blood or blood-forming organs**

3C0Z **Diseases of the blood or blood-forming organs, unspecified**

CHAPTER 04

Diseases of the immune system

This chapter has 45 four-character categories.

Code range starts with 4A00

Exclusions: Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Neoplasms (Chapter 02)

Developmental anomalies (Chapter 20)

Coded Elsewhere: Organ specific autoimmune disorders

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA00-MA3Y)

This chapter contains the following top level blocks:

- Primary immunodeficiencies
- Nonorgan specific systemic autoimmune disorders
- Autoinflammatory disorders
- Allergic or hypersensitivity conditions
- Immune system disorders involving white cell lineages
- Certain disorders involving the immune system
- Organ specific autoimmune disorders

Primary immunodeficiencies (4A00-4A0Z)

4A00 **Primary immunodeficiencies due to disorders of innate immunity**

Coded Elsewhere: Constitutional neutropaenia (4B00.00)

4A00.0 Functional neutrophil defects

Inclusions: Congenital dysphagocytosis

Coded Elsewhere: Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency (3A10.00)

Papillon-Lefèvre syndrome (EC20.30)

4A00.00 Neutrophil immunodeficiency syndrome

Neutrophil immunodeficiency syndrome is a primary immunodeficiency characterised by neutrophilia with severe neutrophil dysfunction, leukocytosis, a predisposition to bacterial infections and poor wound healing, including an absence of pus in infected areas.

4A00.0Y Other specified functional neutrophil defects

4A00.0Z Functional neutrophil defects, unspecified

4A00.1 **Defects in the complement system**

Exclusions: Atypical haemolytic uraemic syndrome (3A10)

Paroxysmal nocturnal haemoglobinuria (3A21.0)

4A00.10 Immunodeficiency with an early component of complement deficiency

4A00.11 Immunodeficiency with a late component of complement deficiency

4A00.12 Immunodeficiency with factor B deficiency

4A00.13 Immunodeficiency with factor D anomaly

Factor D deficiency is an autosomal recessive immunologic disorder characterised by increased susceptibility to bacterial infections, particularly Neisseria infections, due to a defect in the alternative complement pathway.

4A00.14 Hereditary angioedema

Hereditary angioedema is caused in the majority of cases by genetically determined low absolute (type I) or functional (type II) levels of C1 inhibitor, a plasma proteinase inhibitor involved in regulation of complement activation. It is characterised clinically by recurrent subcutaneous and/or submucosal oedema and can result in life-threatening laryngeal obstruction. Involvement of the digestive tract commonly causes abdominal pain. This and the absence of accompanying urticarial weals or itch distinguish it from the common form of angioedema, which is part of the spectrum of urticaria.

4A00.15 Acquired angioedema

Acquired angioedema is clinically similar to hereditary angioedema and is not associated with urticaria. It may be associated with a lymphoproliferative disorder (type I) or may be an isolated phenomenon due to an autoantibody directed against C1 inhibitor (type II).

4A00.1Y Other specified defects in the complement system

4A00.1Z Defects in the complement system, unspecified

4A00.2 **Genetic susceptibility to particular pathogens**

Coded Elsewhere: Encephalitis due to herpes simplex virus (1F00.21)

Chronic mucocutaneous candidosis (1F23.14)

4A00.3 **Immunodeficiency with natural-killer cell deficiency**

4A00.Y **Other specified primary immunodeficiencies due to disorders of innate immunity**

4A00.Z **Primary immunodeficiencies due to disorders of innate immunity, unspecified**

4A01 Primary immunodeficiencies due to disorders of adaptive immunity

4A01.0 **Immunodeficiencies with predominantly antibody defects**

A disorder characterised by an inability to mount a normal immune response due to antibody (i.e. immunoglobulin) defects

4A01.00 Hereditary agammaglobulinaemia with profoundly reduced or absent B cells

This refers to a hereditary type of primary immune deficiency disease characterised by a reduction in all types of gamma globulins, and rare X-linked genetic disorder that affects the body's ability to fight infection.

4A01.01 Immunodeficiencies with severe reduction in at least two serum immunoglobulin isotypes with normal or low numbers of B cells

This refers to a nonfamilial type of primary immune deficiency disease characterised by a reduction in at least two serum immunoglobulin isotypes. Circulating B cells may be normal or low.

4A01.02 Specific antibody deficiency with normal immunoglobulin concentrations or normal number of B cells

4A01.03 Transient hypogammaglobulinaemia of infancy

4A01.04 Immunodeficiencies with isotype or light chain deficiencies with normal number of B cells

4A01.05 Immunodeficiencies with severe reduction in serum IgG or IgA with normal or elevated IgM and normal numbers of B-cells

Coded Elsewhere: Hyper-IgM syndrome due to CD40 ligand deficiency (4A01.1Y)

Hyper-IgM syndrome due to CD40 deficiency (4A01.1Y)

4A01.0Y Other specified immunodeficiencies with predominantly antibody defects

4A01.0Z Immunodeficiencies with predominantly antibody defects, unspecified

4A01.1 Combined immunodeficiencies

Exclusions: autosomal recessive agammaglobulinaemia (Swiss type) (4A01.00)

Coded Elsewhere: Laron syndrome with immunodeficiency (5A61.0)

4A01.10 Severe combined immunodeficiencies

Severe combined immunodeficiency (SCID) comprises a group of rare monogenic primary immunodeficiency disorders characterised by a lack of functional peripheral T lymphocytes resulting in early-onset severe respiratory infections and failure to thrive.

4A01.11 Major histocompatibility complex class I deficiency

4A01.12 Major histocompatibility complex class II deficiency

Immunodeficiency by defective expression of HLA class II is an autosomal recessive primary immune deficiency, manifesting by recurrent viral and bacterial infections, often leading to chronic diarrhoea and growth retardation.

4A01.1Y Other specified combined immunodeficiencies

4A01.1Z Combined immunodeficiencies, unspecified

4A01.2 Diseases of immune dysregulation

4A01.20 Immune dysregulation syndromes with hypopigmentation

Coded Elsewhere: Hermansky-Pudlak syndrome (EC23.20)

Chédiak-Higashi syndrome (EC23.20)

Griscelli syndrome type 2 (4A01.23)

4A01.21 Immune dysregulation syndromes presenting primarily with autoimmunity

Coded Elsewhere: Autoimmune polyendocrinopathy type 1 (5B00)

Syndromic multisystem autoimmune disease due to ITCH deficiency (4A43.Y)

Aicardi-Goutières syndrome (5C55.2)

Spondylometaphyseal dysplasia with combined immunodeficiency (LD24.4)

4A01.22 Immune dysregulation syndromes presenting primarily with lymphoproliferation

4A01.23 Primary haemophagocytic lymphohistiocytosis

A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors leading to uncontrolled proliferation of activated lymphocytes and macrophages. This disease is characterised by increased proliferation of morphologically benign lymphocytes and macrophages that secrete high amounts of inflammatory cytokines. This disease may present with fever, rash, jaundice, splenomegaly, lymphadenopathy, histiocytosis, haemophagocytosis, or cytopenia.

Inclusions: Histiocytoses of mononuclear phagocytes

Coded Elsewhere: Hermansky-Pudlak syndrome (EC23.20)

Chédiak-Higashi syndrome (EC23.20)

4A01.2Y Other specified diseases of immune dysregulation

4A01.2Z Diseases of immune dysregulation, unspecified

4A01.3 Other well-defined immunodeficiency syndromes due to defects in adaptive immunity

This refers to other defects in the highly specialized, systemic cells and processes that eliminate or prevent pathogen growth.

Coded Elsewhere: Wiskott-Aldrich syndrome (3B62.0Y)

Netherton syndrome (LD27.2)

Dyskeratosis congenita (3A70.0)

4A01.30 Immunodeficiency due to defects of the thymus

Coded Elsewhere: CATCH 22 phenotype (LD44.N0)

4A01.31 DNA repair defects other than combined T-cell or B-cell immunodeficiencies

4A01.32 Immuno-osseous dysplasia

This is an autosomal recessive disorder with the diagnostic features of spondyloepiphyseal dysplasia, renal dysfunction, and T-cell immunodeficiency.

Coded Elsewhere: Cartilage-hair hypoplasia (LD27.0Y)

4A01.33 Hepatic veno-occlusive disease - immunodeficiency syndrome

Hepatic veno-occlusive disease - immunodeficiency syndrome is characterised by the association of severe hypogammaglobulinemia, combined T and B cell immunodeficiency, absent lymph node germinal centres, absent tissue plasma cells and hepatic veno-occlusive disease.

4A01.34 Hyperimmunoglobulin E syndromes

4A01.Z **Primary immunodeficiencies due to disorders of adaptive immunity, unspecified**

4A0Y **Other specified primary immunodeficiencies**

4A0Z **Primary immunodeficiencies, unspecified**

4A20 **Acquired immunodeficiencies**

Coded Elsewhere: Human immunodeficiency virus disease (1C60-1C62.Z)

Acquired neutropaenia (4B00.01)

4A20.0 **Adult-onset immunodeficiency**

Adults with disseminated mycobacterial infections and/or other AIDS-defining infections, often involving concomitant neutrophilic dermatoses. All patients have high titres of anti-interferon-gamma and normal CD4 T helper cell counts.

4A20.1 **Acquired immunodeficiency due to loss of immunoglobulin**

Acquired immunodeficiency due to loss of immunoglobulins (protein loss) may occur via the GI tract (protein losing enteropathy), via the kidney (nephrotic syndrome) or via the skin (in severe skin damage).

4A20.Y **Other specified acquired immunodeficiencies**

4A20.Z **Acquired immunodeficiencies, unspecified**

Nonorgan specific systemic autoimmune disorders (4A40-4A4Z)

Coded Elsewhere: Rheumatoid arthritis (FA20)

4A40 **Lupus erythematosus**

An autoimmune non-organ specific inflammatory disease characterised by the presence of antibodies to DNA, RNA and other components of the nucleus. It has a very variable clinical presentation and course ranging from an acute fulminant life-threatening disorder with involvement of heart, central nervous system and kidneys to an indolent chronic scarring skin disorder.

Coded Elsewhere: Subacute cutaneous lupus erythematosus (EB50)

Chronic cutaneous lupus erythematosus (EB51)

Neonatal lupus erythematosus (KA07.0)

4A40.0 **Systemic lupus erythematosus**

Systemic lupus erythematosus (SLE) is a clinically multisystem disease, which is autoimmune in origin and is characterised by the presence of autoantibodies directed against nuclear antigens. Manifestations include rash, arthritis and fatigue, nephritis, neurological problems, anaemia and thrombocytopenia at the more severe end of the spectrum.

4A40.00 Systemic lupus erythematosus with skin involvement

Systemic lupus erythematosus (SLE) involving the skin. This may present with a malar "butterfly" erythema or with extensive necrolysis of sun-exposed skin, particularly on the head, neck and upper torso.

Coded Elsewhere: Immunobullous systemic lupus erythematosus (EB4Y)

4A40.0Y Other specified systemic lupus erythematosus

4A40.0Z Systemic lupus erythematosus, unspecified

4A40.1 **Drug-induced lupus erythematosus**

Drug-induced lupus erythematosus is a syndrome in which positive antinuclear antibodies are associated with symptoms, such as fever, malaise, arthritis, intense arthralgia/myalgia, serositis, and/or rash. The syndrome appears during therapy with certain medications (e.g., procainamide, hydralazine, phenytoin) and tumour necrosis factor inhibitors. It occurs predominantly in Caucasians, has less female predilection than SLE, rarely involves kidneys or brain, is rarely associated with anti-dsDNA, is commonly associated with antibodies to histones, and usually resolves over several weeks after discontinuation of the offending medication.

4A40.Y **Other specified lupus erythematosus**

4A40.Z **Lupus erythematosus, unspecified**

4A41 Idiopathic inflammatory myopathy

These comprise a diverse group of syndromes that have in common persistent muscle inflammation of unknown pathophysiology, resulting in damage that affects muscle function. The inflammatory muscle disease can either be acute or chronic in nature.

Coded Elsewhere: Extraocular myositis (9C82.3)

4A41.0 **Dermatomyositis**

Dermatomyositis is an inflammatory myopathy, showing progressive, symmetrical muscle weakness, low muscle endurance, and cutaneous manifestations such as Gottron’s papules, heliotrope rash, shawl sign, V-sign and mechanic’s hand. Internal organ manifestations such as interstitial pneumonia (pneumonitis) and myocarditis sometimes develop. The skin rash may precede the muscle symptoms and may be the only clinical sign of dermatomyositis in some patients (clinically, amyopathic dermatomyositis).

4A41.00 Adult dermatomyositis

Adult dermatomyositis is a systemic inflammatory disorders affecting the skeletal muscles, the skin, and other organs. It is characterised by symmetric proximal muscle weakness, increased serum muscle enzymes, myopathic changes upon electromyography, typical histological findings on muscle biopsy, and typical dermatologic manifestations such as heliotrope rash or Gottron's papules.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

4A41.01 Juvenile dermatomyositis

Juvenile dermatomyositis is the early-onset form of dermatomyositis, a systemic autoimmune inflammatory muscle disorder, characterised by proximal muscle weakness, evocative skin lesion, and systemic manifestations.

4A41.0Z Dermatomyositis, unspecified

4A41.1 Polymyositis

Polymyositis is an inflammatory muscle disease of unknown aetiology occurring predominantly in adults and characterised clinically by proximal muscle weakness (shoulders, arms, thighs), often with associated myalgia. Involvement of pharyngeal and oesophageal muscles may result in dysphagia and a risk of aspiration pneumonia. Myocarditis with rhythm disturbances or cardiomyopathy is a rare but serious complication. Polymyositis may be associated with other autoimmune diseases, malignancy or viral infection. Although serum muscle enzyme concentrations and electromyography are usually abnormal, definitive diagnosis requires demonstration of characteristic histological changes, including muscle necrosis, muscle fibre regeneration and diffuse infiltration by CD8+ T lymphocytes, on muscle biopsy.

4A41.10 Juvenile polymyositis

Juvenile polymyositis is a rare childhood idiopathic inflammatory myopathy. It is frequently misdiagnosed, as it lacks a unique clinical phenotype. Traditionally, it presents with weakness of the proximal muscles that evolves over weeks to months. The primary histologic features in are fibre size variability, scattered necrotic and regenerating fibres, and perivascular and endomysial cellular infiltrates.

Exclusions: Systemic sclerosis (4A42)

Overlap or undifferentiated nonorgan specific systemic autoimmune disease (4A43)

Antiphospholipid syndrome (4A45)

Vasculitis (4A44)

Lupus erythematosus (4A40)

4A41.11 Paraneoplastic polymyositis

Paraneoplastic is a rare cancer associated entity. It presents sub-, or acutely with proximal weakness, often including the neck flexors, dysphagia, rarely the respiratory muscles and the heart are involved. Sometimes muscle pain or myalgia occur. Myopathology shows a targeted, cell-mediated lymphocyte toxicity against muscle fibres in focal areas of inflammation within perimysial connective tissue and surrounding blood vessels. Muscle fibres may be destroyed by cytotoxic T cells.

Non-Hodgkin's lymphoma, lung, and bladder carcinoma are the most frequently observed associated cancer types.

Coding Note: Code also the causing condition

4A41.1Y Other specified polymyositis

4A41.1Z Polymyositis, unspecified

4A41.2 **Inclusion body myopathy**

Inclusion body myopathy (IBM) is distinguished from polymyositis (PM) and dermatomyositis (DM) on the basis of clinical and histopathological features. A characteristic clinical phenotype is characterised by insidious onset of muscle weakness over months to years, muscle weakness localised predominantly in the thigh muscles and finger flexors, and resistance to glucocorticoid treatment. Typical histopathologic features include sarcoplasmic and nuclear inclusions and rimmed vacuoles. (Kelley's Textbook of Rheumatology, 6th Ed.)

4A41.20 Inflammatory inclusion body myositis

Inclusion body miositis (IBM) is the most common idiopathic inflammatory myopathies after age 50. It typically presents with chronic insidious proximal leg and/or distal arm asymmetric muscle weakness leading to recurrent falls and loss of dexterity. Creatine kinase is up to 15 times elevated in IBM and needle electromyography mostly shows a chronic irritative myopathy. Muscle histopathology demonstrates endomysial inflammatory exudates surrounding and invading non-necrotic muscle fibres often times accompanied by rimmed vacuoles and protein deposits. Despite inflammatory muscle pathology, it likely that IBM is has a prominent degenerative component as supported by refractoriness to immunosuppressive therapy.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

4A41.21 Noninflammatory inclusion body myopathy

Noninflammatory inclusion body myopathy (IBM) is an idiopathic muscle disorder without inflammatory exudates and expression of class I major histocompatibility complex. Rimmed vacuoles and "IBM-like" filaments without inflammatory cells are described in muscle biopsy.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

4A41.2Z Inclusion body myopathy, unspecified

4A41.Y **Other specified idiopathic inflammatory myopathy**

4A41.Z **Idiopathic inflammatory myopathy, unspecified**

4A42 Systemic sclerosis

Systemic sclerosis is a systemic disorder of the connective tissue; manifested by hardening and thickening of the skin, by abnormalities involving the microvasculature and larger vessels, and by fibrotic degenerative changes in various body organs including the heart, lungs, kidneys, and gastrointestinal tract. (Arthritis Rheum 1980;23:581-590)

Inclusions: Systemic scleroderma

Exclusions: Circumscribed scleroderma (EB61.0)

4A42.0 **Paediatric onset systemic sclerosis**

Systemic sclerosis arising before the age of 16. Involvement of internal organs is less common but arthritis and myositis are more common than in adults.

4A42.1 **Diffuse systemic sclerosis**

Diffuse cutaneous systemic sclerosis (dcSSc) is a subtype of Systemic Sclerosis (SSc) characterised by truncal and acral skin fibrosis with an early and significant incidence of diffuse involvement (interstitial lung disease, oliguric renal failure, diffuse gastrointestinal disease, and myocardial involvement).

4A42.2 **Limited systemic sclerosis**

Combination of calcinosis, Raynaud phenomenon, (o)oesophageal dysfunction, sclerodactyly and telangiectasia.

4A42.Z **Systemic sclerosis, unspecified**

4A43 Overlap or undifferentiated nonorgan specific systemic autoimmune disease

Nonorgan specific systemic autoimmune diseases which do not fulfil the diagnostic criteria for any single recognised disease entity.

4A43.0 **IgG4 related disease**

IgG4 related syndrome (IgG4-related disease: IgG4-RD) is a clinical disease characterised by elevated serum IgG4 concentration and tumefaction or tissue infiltration by IgG4-positive plasma cells. The diagnostic criteria for IgG4 related syndrome have been proposed, and it may be present in a certain population of patients with a wide variety of diseases, including Mikulicz disease, autoimmune pancreatitis, hypophysitis, Riedel thyroiditis, interstitial pneumonitis, interstitial nephritis, prostatitis, lymphadenopathy, retroperitoneal fibrosis, inflammatory aortic aneurysm, and inflammatory pseudo tumour.

Coded Elsewhere: Primary cutaneous plasmacytosis (EK91.2)

Benign dermal lymphocytic or lymphoplasmacytic infiltrations or proliferations (EE90-EE91)

Type 1 IgG4 related autoimmune pancreatitis (DC33)

4A43.1 **Mikulicz disease**

Mikulicz disease is a disorder first reported by Johann von Mikulicz in 1892 and characterised by symmetrical swelling of the lachrymal, submandibular, and parotid glands, with massive infiltration of these glands by mononuclear cells. Serum autoantibodies, such as anti-Ro/SS-A, are usually negative and serum IgG4 concentration may be increased. Unlike Sjögren disease, IgG4-Mikulicz disease is characterised by the formation of lymphoid follicles, but shows lower levels of lymphocytic infiltration into salivary ducts, such that their structure remains intact.

4A43.2 **Sjögren syndrome**

Sjögren syndrome is a slowly progressive, systemic inflammatory autoimmune disease affecting primarily the exocrine glands. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness. Characteristic autoantibodies (e.g., anti-Ro/SS-A and/or anti-La/SS-B) are produced. The disorder can occur alone (it is then known as ``primary-SS'') or in association with another autoimmune disease (it is then known as ``secondary-SS'').

Coded Elsewhere: Keratoconjunctivitis sicca (9A79)

4A43.20 Primary Sjögren syndrome

4A43.21 Secondary Sjögren syndrome

Secondary Sjögren syndrome is a progressive inflammatory autoimmune disease affecting the exocrine glands in the presence of other systemic autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, and systemic sclerosis. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness.

Coding Note: Code also the causing condition

4A43.22 Paediatric onset Sjögren syndrome

4A43.2Y Other specified sjögren syndrome

4A43.3 **Mixed connective tissue disease**

Mixed connective tissue disease is an overlapping syndrome combining features of systemic lupus erythematosus, systemic sclerosis, and polymyositis with the presence of autoantibodies to U1-ribonucleoprotein. Raynaud’s phenomenon is seen in nearly all patients and pulmonary arterial hypertension is the most common cause of death in MCTD patients.

4A43.4 **Diffuse eosinophilic fasciitis**

Also called Shulman disease/diffuse fasciitis, diffuse eosinophilic fasciitis is a rare idiopathic disorder associated with induration of the skin (orange-peel sign) that generally develops rapidly. It is a dermal and hypodermal sclerosis associated with fibrotic thickening of the subcutaneous adipose lobular septa, superficial fascia, and perimysium. Full thickness excisional biopsy of skin lesions revealing fibrosis of the subcutaneous fascia is generally required for diagnosis. Onset follows unusual physical exertion and trauma, especially in males.

4A43.Y **Other specified overlap non-organ specific systemic autoimmune disease**

4A43.Z **Undifferentiated non-organ specific systemic autoimmune disease**

4A44 **Vasculitis**

Vasculitides represent a heterogenous group of diseases of multifactorial aetiology characterised by inflammatory lesions of vessels. These lesions consist of fibrinoid necrosis (necrotizing arteritis), giant cell infiltration without necrosis, immunoglobulins deposit or leukocytoclastic infiltration. The spectrum and severity of the systemic vaculitides is broad, from life or sight threatening fulminant disease to relatively minor skin disease.

Coded Elsewhere: Behçet disease (4A62)

Thrombotic microangiopathy, not elsewhere classified (3B65)

4A44.0 Rhizomelic pseudopolyarthritis

4A44.1 Aortic arch syndrome

Arteritis, often granulomatous, predominantly affecting the aorta and/or its major branches. Onset usually in patients younger than 50.

4A44.2 Giant cell arteritis

Arteritis, often granulomatous, usually affecting the aorta and/or its major branches, with a predilection for the branches of the carotid artery. Often involves the temporal artery. Onset usually in patients older than 50 and often associated with polymyalgia rheumatica.

4A44.3 Single organ vasculitis

Vasculitis in arteries or veins of any size in a single organ that has no features that indicate that it is a limited expression of a systemic vasculitis. The involved organ and vessel type should be included in the name (e.g. cutaneous SVV, testicular arteritis, central nervous system vasculitis). Vasculitis distribution may be unifocal or multifocal (diffuse) within an organ. Some patients originally diagnosed with SOV will develop additional disease manifestations that warrant re-defining the case as one of the systemic vasculitides (e.g. cutaneous arteritis later becoming systemic polyarteritis nodosa, etc.).Chapel Hill Consensus Conference, 2011)

4A44.4 Polyarteritis nodosa

Polyarteritis nodosa is an immunologically mediated systemic necrotising vasculitis affecting medium-sized vessels. In a few cases, the disease appears after viral infection but in the majority of cases there is no known triggering event. The clinical manifestations involve numerous organs and lead to a general alteration in the health status including rapid weight loss, paralysis of the peripheral nerves, renal disease, and digestive problems such as haemorrhages, perforation, appendicitis and pancreatitis. Arthralgia is almost always present and myalgia occurs in half of patients. Cardiac and cerebral anomalies (cephalalgia) are also reported, as well as ocular and genital (orchitis) manifestations.

4A44.5 **Mucocutaneous lymph node syndrome**

Mucocutaneous lymph node syndrome (Kawasaki disease) is a globally distributed acute vasculitis of young children affecting medium to small calibre arteries and if untreated leads to coronary artery aneurysms in about a quarter of cases. Cardinal signs include cervical lymphadenopathy, conjunctival injection, rash (maculopapular, erythrodermic or erythema multiforme-like), strawberry tongue, oropharyngeal erythema, erythema and swelling of hands and feet and periungual desquamation. The cause is unknown but thought to be environmental, possibly from viral infection. A variant of the disease has been linked to SARS CoV-2 infection.

Inclusions: Kawasaki syndrome

4A44.6 **Sneddon syndrome**

Sneddon syndrome associates livedo reticularis and neurological signs. Livedo is permanent, cyanotic, with no infiltration, and affects the limbs, trunk and sometimes the face. Neurological signs appear later and include cerebrovascular accidents, epilepsy, vertigo and more rarely a pseudobulbar syndrome, chorea, episodes of amnesia or transient amaurosis.

4A44.7 **Primary angiitis of the central nervous system**

In primary angiitis of the central nervous system, vasculitis is limited to the central nervous system. Primary angiitis of the central nervous system is a very rare disease, and its manifestation can be mimicked by many other diseases. Patients with primary angiitis commonly show headache, waxing and waning altered mental status, and transient ischemic attack-like events. Diagnosis is often based on angiography, although brain biopsy remains the only definitive diagnostic test.

4A44.8 **Thromboangiitis obliterans**

Thromboangiitis obliterans (TAO), or Buerger's disease, is a segmental occlusive inflammatory condition of arteries and veins, with thrombosis and recanalization of the affected vessels. It is a nonatherosclerotic inflammatory disease affecting small and medium sized arteries and veins of upper and lower extremities. TAO can be distinguished from other types of vasculitis based on its tendency to occur in young male subjects. The etiology and pathogenesis of TAO remains unknown; however, tobacco consumption plays a key role in the initiation and persistence of the disease.

4A44.9 **Immune complex small vessel vasculitis**

Coded Elsewhere: Anti-glomerular basement membrane antibody mediated disease (MF85)

Susac syndrome (8A45.2Y)

4A44.90 Cryoglobulinaemic vasculitis

Vasculitis with cryoglobulin immune deposits affecting small vessels (predominantly capillaries, venules, or arterioles) and associated with cryoglobulins in serum. Skin and glomeruli are often involved.

4A44.91 Hypocomplementaemic urticarial vasculitis

Vasculitis accompanied by urticaria and hypocomplementemia affecting small vessels (i.e., capillaries, venules, or arterioles), and associated with anti-C1q antibodies. Glomerulonephritis, arthritis, obstructive pulmonary disease, and ocular inflammation are common.(Chapel Hill Consensus Conference, 2011)

4A44.92 IgA vasculitis

Vasculitis, with IgA1-dominant immune deposits, affecting small vessels (predominantly capillaries, venules, or arterioles). Often involves skin and gut, and frequently causes arthritis. Glomerulonephritis indistinguishable from IgA nephropathy may occur.

Inclusions: Henoch-Schönlein purpura

Coded Elsewhere: Respiratory disorders in IgA vasculitis (CB05.4Y)

Noninfectious enteritis or ulcer due to IgA vasculitis (DA94.Y)

4A44.9Y Other specified immune complex small vessel vasculitis

4A44.9Z Immune complex small vessel vasculitis, unspecified

4A44.A **Antineutrophil cytoplasmic antibody-associated vasculitis**

Necrotizing vasculitis, with few or no immune deposits, predominantly affecting small vessels (i.e., capillaries, venules, arterioles and small arteries), associated with MPO-ANCA or PR3-ANCA. Not all patients have ANCA. Add a prefix indicating ANCA reactivity, e.g. PR3-ANCA, MPO-ANCA, ANCA-negative.

4A44.A0 Microscopic polyangiitis

Necrotizing vasculitis, with few or no immune deposits, predominantly affecting small vessels (i.e., capillaries, venules, or arterioles). Necrotizing arteritis involving small and medium sized arteries may be present. Necrotizing glomerulonephritis is very common. Pulmonary capillaritis often occurs. Granulomatous inflammation is absent.

Inclusions: Microscopic polyarteritis

Exclusions: Polyarteritis nodosa (4A44.4)

4A44.A1 Granulomatosis with polyangiitis

Necrotizing granulomatous inflammation usually involving the upper and lower respiratory tract, and necrotizing vasculitis affecting predominantly small to medium-sized vessels (e.g., capillaries, venules, arterioles, arteries and veins). Necrotizing glomerulonephritis is common . (Arthritis Rheum 1990;33:1101-1107)

Inclusions: Wegener granulomatosis

4A44.A2 Eosinophilic granulomatosis with polyangiitis

Eosinophil-rich and necrotizing granulomatous inflammation often involving the respiratory tract, and necrotizing vasculitis predominantly affecting small to medium-sized vessels, and associated with asthma and eosinophilia. ANCA is most frequent when glomerulonephritis is present. (Arthritis Rheum 1990;33:1094-1100)

Inclusions: Churg-Strauss syndrome

4A44.AY Other specified antineutrophil cytoplasmic antibody-associated vasculitis

4A44.AZ Antineutrophil cytoplasmic antibody-associated vasculitis, unspecified

4A44.B **Leukocytoclastic vasculitis**

Leukocytoclastic vasculitis (hypersensitivity vasculitis; hypersensitivity angiitis) is a histopathological term commonly used to denote a small-vessel vasculitis. It may be localised to the skin or may manifest in other organs. The internal organs affected most commonly include the joints, the gastrointestinal tract, and the kidneys. The prognosis is good in the absence of internal involvement. Leukocytoclastic vasculitis has many causes including infections, drugs and systemic autoimmune diseases but no cause is identified in up to 50% of patients with this condition.

4A44.B0 Cutaneous leukocytoclastic vasculitis

Skin-limited small vessel leucocytoclastic vasculitis of unspecified or unknown aetiology

4A44.BY Other specified leukocytoclastic vasculitis

4A44.BZ Leukocytoclastic vasculitis, unspecified

4A44.Y **Other specified vasculitis**

4A44.Z **Vasculitis, unspecified**

4A45 **Antiphospholipid syndrome**

Antiphospholipid syndrome, also known as Hughes syndrome, is a systemic autoimmune condition characterised by the presence of antiphospholipid antibodies (aPL) in the serum of patients with thrombotic events and/or recurrent pregnancy complications.

4A45.0 **Primary antiphospholipid syndrome**

4A45.1 **Secondary antiphospholipid syndrome**

Coding Note: Code also the causing condition

4A45.2 **Antiphospholipid syndrome in pregnancy**

4A45.3 **Lupus anticoagulant-hypoprothrombinaemia syndrome**

4A45.Z **Antiphospholipid syndrome, unspecified**

4A4Y **Other specified nonorgan specific systemic autoimmune disorders**

4A4Z **Nonorgan specific systemic autoimmune disorders, unspecified**

Autoinflammatory disorders (4A60-4A6Z)

Coded Elsewhere: Schnitzler syndrome (EB03)

4A60 **Monogenic autoinflammatory syndromes**

Monogenic hereditary autoinflammatory diseases characterised by apparently unprovoked generalised inflammation in the absence of infection or high titre autoantibodies.

4A60.0 Familial Mediterranean fever

FMF is an autoinflammatory disease associated with mutations in pyrin resulting in enhanced IL1 beta production. This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.

4A60.1 Cryopyrin-associated periodic syndromes

CAPS is an autoinflammatory disease associated with gain of function changes in the cryopyrin protein, resulting in inflammasome activation and enhanced IL1 beta production. This results in clinical signs and symptoms of inflammation in the form of rash, fever, joint and eye symptoms with increased acute phase reactants.

Inclusions: Cryopyrinopathies

4A60.2 Tumour necrosis factor receptor 1 associated periodic syndrome

TRAPS is an autoinflammatory disease associated with heterozygous mutations in the gene coding for tumour necrosis factor (TNF) receptor 1 (TNFR1).This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.

4A60.Y Other specified monogenic autoinflammatory syndromes

4A60.Z Autoimflammatory syndrome, unspecified

4A61 SAPHO syndrome

SAPHO syndrome is characterised by a constellation of symptoms and signs including synovitis, acne conglobata or fulminans, palmoplantar pustulosis, hyperostosis and osteitis. Its aetiology is poorly understood.

4A62 Behçet disease

Behçet disease is a disease of incompletely understood aetiopathogenesis characterised by recurrent oral and/or genital aphthous ulcers accompanied by cutaneous, ocular, articular, gastrointestinal, and/or central nervous system inflammatory lesions. Small vessel vasculitis, thrombotic vasculopathy, arteritis and arterial aneurysms may occur. It has a high prevalence from the Eastern Mediterranean across Central Asia to China and Japan.

Inclusions: Adamantiades-Behçet disease

Coded Elsewhere: Transient neonatal Behçet disease (KA07.Y)

4A6Y Other specified autoinflammatory disorders

4A6Z Autoinflammatory disorders, unspecified

Allergic or hypersensitivity conditions (4A80-4A8Z)

Allergy is a hypersensitivity reaction initiated by a proven immunologic mechanisms.

Hypersensitivity is defined as conditions clinically resembling allergy that cause objectively reproducible symptoms or signs, initiated by exposure to a defined stimulus at a dose tolerated by normal subjects.

Coded Elsewhere: Eosinophilia (4B03)

Hypersensitivity reactions of unspecified nature (4B07)

4A80 **Allergic or hypersensitivity disorders involving the respiratory tract**

Allergic or hypersensitivity disorders involving the respiratory tract includes several clinically different conditions that can be considered as hypersensitivity disorders of the upper and lower respiratory tract. The classification of these conditions is complex.

Coded Elsewhere: Vasomotor or allergic rhinitis (CA08)

Aspergillus-induced allergic or hypersensitivity conditions (CA82.4)

Chronic rhinosinusitis (CA0A)

Asthma (CA23)

Nasal polyp (CA0J)

Hypersensitivity pneumonitis due to organic dust (CA70)

4A80.0 Drug-induced bronchospasm

Drug-induced bronchospasm is a common clinical manifestation triggered by various drugs. It ranges in severity from mild to severe, and even fatal from post-anoxic brain damage. It can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

4A80.1 Bronchospasm provoked by allergy to food substance

Bronchospasm provoked by allergy to food allergens is clinical manifestation triggered by various foods as a phenotype of food hypersensitivity. It is more frequent in the youngest atopic patients and the most common foods responsible for these reactions are cow milk, peanut, egg and tree nuts. This clinical presentation can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

4A80.Y Other specified allergic or hypersensitivity disorders involving the respiratory tract

4A80.Z Allergic or hypersensitivity disorders involving the respiratory tract, unspecified

4A81 Allergic or hypersensitivity disorders involving the eye

Allergic or hypersensitivity disorders involving the eye includes several clinically different conditions that can be considered as hypersensitivity disorders of the ocular surface. The classification of these conditions is complex.

Coded Elsewhere: Allergic conjunctivitis (9A60.02)

Vernal keratoconjunctivitis (9A60.5)

Giant papillary conjunctivitis (9A60.00)

Irritant contact blepharoconjunctivitis (EK02.11)

Acute atopic conjunctivitis (9A60.01)

Atopic keratoconjunctivitis (9A60.0Y)

Vernal conjunctivitis (9A60.0Y)

4A82 Allergic or hypersensitivity disorders involving skin or mucous membranes

Allergic or hypersensitivity disorders involving the skin and mucous includes a heterogeneous group of disorders involving skin and mucous membranes in which either allergy or hypersensitivity play a part.

Coded Elsewhere: Allergic contact dermatitis (EK00)

Photo-allergic contact dermatitis (EK01)

Allergic contact urticaria (EK10)

Protein contact dermatitis (EK11)

Allergic contact sensitisation (EK12)

Urticaria, angioedema and other urticarial disorders (EB00-EB0Y)

Atopic eczema (EA80)

Allergy to substances in contact with the skin (EK5Y)

4A83 Allergic or hypersensitivity disorders involving the gastrointestinal tract

Coded Elsewhere: Allergic gastritis (DA42.4)

Allergic duodenitis (DA51.3)

Allergic or dietetic colitis (DB33.2)

Allergic or dietetic enteritis of small intestine (DA94.2)

4A83.0 Food-induced eosinophilic gastroenteritis

A disease characterised by eosinophilic infiltration of various layers of stomach and intestine induced by specific food intake in the absence of any known cause of eosinophilia. It can occur in any age and the symptoms vary depending on the site of the intestinal tract involved and degree of eosinophilic inflammation, might include ascites, weight loss, oedema, obstruction.

4A83.1 Food-induced eosinophilic oesophagitis

A chronic, immune or antigen-mediated oesophageal disease characterised by eosinophilic infiltration of oesophageal wall induced by specific food intake in the absence of any known cause of eosinophilia. The symptoms are related to oesophageal dysfunction, including feeding disorders, reflux symptoms, vomiting, dysphagia, and food impaction.

4A83.Y Other specified allergic or hypersensitivity disorders involving the gastrointestinal tract

4A83.Z Allergic or hypersensitivity disorders involving the gastrointestinal tract, unspecified

4A84 Anaphylaxis

Anaphylaxis is a severe, life-threatening systemic hypersensitivity reaction characterised by being rapid in onset with potentially life-threatening airway, breathing, or circulatory problems and is usually, although not always, associated with skin and mucosal changes.

4A84.0 Anaphylaxis due to allergic reaction to food

Rapidly progressive, multi-system and potentially life-threatening reaction to exposure to a food allergen to which the affected individual has previously been sensitized.

Exclusions: obstruction from food aspiration (ND72)

food intolerance (DA96.02)

4A84.1 Drug-induced anaphylaxis

Anaphylaxis attributable to a drug. When severe it may be fatal. This systemic reaction usually develops within minutes to hours of administration of the drug, is often severe and may be fatal. The most frequent drugs causing anaphylaxis are antibiotics, particularly penicillins. Clinically there may be premonitory dizziness or faintness, skin tingling and erythema, followed by urticaria, angio-oedema, bronchospasm, abdominal pain and vasomotor collapse.

Coded Elsewhere: Anaphylaxis due to radiocontrast media (EL80)

4A84.2 Anaphylaxis due to insect venom

Anaphylaxis due to insect venom is a severe systemic hypersensitivity reaction with rapid onset of cutaneous, vascular or respiratory symptoms and signs, either singly or in any combination after exposure (mainly by sting) to an insect venom in a sensitized patient.

Exclusions: Harmful effects of or exposure to noxious substances, Substances chiefly nonmedicinal as to source, Venoms or toxins (NE61)

4A84.3 Anaphylaxis provoked by physical factors

Anaphylaxis provoked by physical factors covers a group of anaphylaxis phenotypes in which physical factors are the main triggers. The most relevant are: exercise-induced anaphylaxis, exercise-induced anaphylaxis dependent on food, cold-induced anaphylaxis.

4A84.30 Exercise-induced anaphylaxis

Exercise-induced anaphylaxis is disorder in which anaphylaxis occurs after physical activity. The clinical features may include pruritus, urticarial weals, flushing, wheezing, and gastrointestinal disturbance including nausea, abdominal cramping, and diarrhoea. If physical activity continues, angioedema, laryngeal oedema, hypotension, and, ultimately, cardiovascular collapse may occur. Exercise-induced anaphylaxis is most commonly associated with IgE-mediated allergy to food whereby anaphylaxis occurs only if ingestion is followed temporally by exercise. Cessation of physical activity usually results in immediate improvement of symptoms.

4A84.31 Cold-induced anaphylaxis

Cold-induced anaphylaxis is triggered by skin cooling. The deaths are directly caused by the anaphylactic reaction due to drowning when swimming in cold water.

4A84.3Y Anaphylaxis provoked by other specified physical factors

4A84.3Z Anaphylaxis provoked by unspecified physical factors

4A84.4 Anaphylaxis due to inhaled allergens

Rapid progressive, multisystem life-threatening reaction due to the exposure to a sensitized inhaled allergen, such as particles from rubber gloves or latex products, animal dander and dust mite.

Use additional external cause code, if desired, to identify agent.

Exclusions: Allergic asthma with exacerbation (CA23.00)

4A84.5 Anaphylaxis due to contact with allergens

Anaphylaxis resulting from skin or mucosal contact with a substance or substances capable of inducing IgE-mediated response in patients previously sensitized.

Use additional external cause code, if desired, to identify agent.

4A84.6 Anaphylaxis secondary to mast cell disorder

Symptoms of anaphylaxis secondary to mast cell disorders result from excessive mast cell mediator release, especially histamine, and may include pruritus and flushing, abdominal pain, diarrhea, dyspnoea, tachycardia, or profound hypotension. It happens in both children and adults, but in adults it can occur even without urticaria pigmentosa lesions. Levels of basal tryptase are constantly high. Fatal anaphylaxis has been described following hymenoptera stings and in the preoperative period.

4A84.Y Other specified anaphylaxis

4A84.Z Anaphylaxis, unspecified

4A85 Complex allergic or hypersensitivity conditions

4A85.0 **Drug or pharmacological agents hypersensitivity**

Drug hypersensitivity reactions are the adverse effects of pharmaceutical formulations (including active drugs and excipients) that clinically resemble allergy. It belongs to type B adverse drug reactions, which are defined by the World Health Organization as the dose-independent, unpredictable, noxious, and unintended response to a drug taken at a dose normally used in humans. It covers many different clinical phenotypes with variable onset and severity.

Coded Elsewhere: Drug eruptions (EH60-EH6Z)

Drug-induced bronchospasm (4A80.0)

Drug-induced aplastic anaemia (3A70.10)

Aspirin-induced asthma (CA23.20)

Samter syndrome (CA0A.0)

Photoallergic drug reaction (EH75)

Pseudolymphomatous drug hypersensitivity syndrome (EH6Y)

Anaphylaxis due to radiocontrast media (EL80)

4A85.00 Drug-induced liver hypersensitivity disease

Drug-induced liver hypersensitivity disease is a relatively rare condition, but can have serious consequences for the individual patient, public health, regulatory agencies and the pharmaceutical industry. It is characterised by elevation in serum alanine-aminotransferase (ALT), conjugated bilirubin, or combined bilirubin, ALT and alkaline phosphatase (AP) levels > 2 times the upper limit of normal (ULN) and the most frequent related drugs are halothane, tienilic acid, dihydralazine, diclofenac, and carbamazepine.

4A85.01 Drug-induced kidney hypersensitivity

Drug-induced kidney hypersensitivity constitutes an important cause of acute renal failure and chronic kidney disease in present day clinical practice. Different classes of drugs, by virtue of immunological mechanisms initiate specific inflammatory renal responses, which are manifested by different clinical patterns, such as drug-induced interstitial nephritis. The drug-induced kidney hypersensitivity can manifest alone or in combination with other drug-induced organ or system hypersensitivity disorders.

Coded Elsewhere: Acute renal papillary necrosis due to drugs, biological agents or environmental toxins (GB53)

4A85.02 Drug-induced cytopenia

Drug-induced cytopenia is a relatively common immune-mediated cytopenia and the target cells include erythrocytes, leukocytes, platelets and hematopoietic precursor cells in the marrow. The most frequent condition is the drug-induced immune thrombocytopenia and the most frequent implicated drugs are penicillin and structurally related drugs, quinine, quinidine, sulfonamide antibiotics, non-steroidal anti-inflammatory drugs and anticonvulsants.

Coded Elsewhere: Drug-induced immune thrombocytopenia (3B64.12)

Drug-induced secondary agranulocytosis (4B00.01)

4A85.03 Drug-induced vasculitis

Drug-induced vasculitis is an inflammatory vasculopathy associated with drugs of almost every class and accounting for approximately 3% of the vasculitides. Although small vessel disease limited to the skin is the most common form, involvement of blood vessels in virtually every organ system may occur. It can present multiorgan involvement and the mortality is described in up to 10% of cases.

4A85.04 Multiple drug hypersensitivity syndrome

Multiple drug hypersensitivity syndrome is defined as drug allergies to two or more chemically different drugs. It differs from cross-reactivity (due to structural similarities, common metabolic pathways, or pharmacological mechanisms), flare-up reactions (exacerbation of an existing drug allergy by the early switch of therapy to a novel drug), and multiple drug intolerance syndrome.

4A85.0Y Drug hypersensitivity of other specified type

4A85.0Z Drug hypersensitivity of unspecified type

4A85.1 **Hypersensitivity to herbal and alternative medical therapies**

Hypersensitivity to herbal and alternative medical therapies refers to unpredictable conditions clinically resembling allergy that cause objectively reproducible symptoms or signs, initiated by exposure to herbal and other alternatives medical therapies, such as homeopathy, cupping or acupuncture. Herbal and alternative medical therapies are not customarily regarded as drugs, but can trigger immune and non-immune mediated reactions, which occur in susceptible individuals. These reactions are triggered by doses and procedures usually tolerated by normal subjects.

Exclusions: Adverse cutaneous reactions to herbal, homoeopathic or other alternative therapies (EH78)

4A85.2 **Food hypersensitivity**

Food hypersensitivity reactions are adverse effects of food or food additives that clinically resemble allergy. Food allergy is an adverse reaction to food mediated by an immunologic mechanism, involving specific IgE (IgE-mediated), cell-mediated mechanisms (non-IgE-mediated) or both IgE- and cell-mediated mechanisms (mixed IgE- and non-IgE-mediated).

Exclusions: food intolerance (DA96.02)

Coded Elsewhere: Oral allergy syndrome (EK10.0)

Contact urticaria due to food allergen (EK10.1)

Anaphylaxis due to allergic reaction to food (4A84.0)

Bronchospasm provoked by allergy to food substance (4A80.1)

4A85.20 Food-induced gastrointestinal hypersensitivity

Food-induced gastrointestinal hypersensitivity covers a group of gastrointestinal hypersensitivity disorders due to food allergens with variable onset, severity, clinical presentation and mechanisms.

Coded Elsewhere: Food-induced eosinophilic gastroenteritis (4A83.0)

Allergic or dietetic colitis (DB33.2)

Food-induced eosinophilic oesophagitis (4A83.1)

Allergic or dietetic enteritis of small intestine (DA94.2)

Food-induced non-IgE-mediated gastrointestinal hypersensitivity (DA42.41)

4A85.21 Food-induced urticaria or angioedema

Urticaria and/or angioedema triggered by ingestion or direct contact of food allergen in sensitized patient.

4A85.22 Allergic contact dermatitis due to food allergen

Allergic contact dermatitis, which most common causal foods are spices, fruits, vegetables. Often occupational because of contact with chemical moieties, oleoresins. Systemic contact dermatitis is a rare variant because of ingestion.

Use additional external cause code, if desired, to identify agent.

Coded Elsewhere: Allergic contact dermatitis due to food flavours or additives (EK00.3)

4A85.2Y Other specified food hypersensitivity

4A85.2Z Food hypersensitivity, unspecified

4A85.3 Allergic or hypersensitivity reactions to arthropods

This includes both local cutaneous and systemic allergic and hypersensitivity reactions to contact with insects (e.g. bees, wasps and fire ants) and other arthropods (e.g. scorpions and spiders). Reactions are usually mediated via the immune system (IgE-mediated or non-IgE-mediated allergy).

4A85.30 Systemic allergic reaction due to Hymenoptera venom

Systemic Allergic Reaction due to Hymenoptera venom due to insect venom is a severe hypersensitivity reaction with rapid onset of cutaneous, vascular or respiratory symptoms and signs, either singly or in any combination after exposure (mainly by sting) to an insect venom in a sensitized patient.

Coded Elsewhere: Anaphylaxis due to insect venom (4A84.2)

4A85.31 Cutaneous allergic or hypersensitivity reactions to Hymenoptera venom

Cutaneous reactions to Hymenoptera venom are hypersensitivity reactions classified into normal local reactions and large local reactions. Large local reaction is defined as a swelling exceeding a diameter of 10 cm which lasts longer than 24 h; blisters may rarely be present.

4A85.32 Cutaneous allergic or hypersensitivity reactions to arthropods

4A85.Y Other specified complex allergic or hypersensitivity conditions

4A85.Z **Complex allergic or hypersensitivity conditions, unspecified**

4A8Y **Allergic or hypersensitivity conditions of other specified type**

4A8Z **Allergic or hypersensitivity conditions of unspecified type**

Immune system disorders involving white cell lineages (4B00-4B0Z)

Coded Elsewhere: Immunodeficiencies with predominantly antibody defects (4A01.0)

Combined immunodeficiencies (4A01.1)

Defects in the complement system (4A00.1)

Diseases of immune dysregulation (4A01.2)

Other well-defined immunodeficiency syndromes due to defects in adaptive immunity (4A01.3)

4B00 **Disorders of neutrophil number**

Exclusions: Decreased white blood cell count (MA16.10)

4B00.0 **Neutropaenia**

Coded Elsewhere: Transient neonatal neutropaenia (KA8D)

Alloimmune neonatal neutropaenia (KA8E)

4B00.00 Constitutional neutropaenia

This is a granulocyte disorder characterised by an abnormally low number of neutrophils. Neutrophils usually make up 50-70% of circulating white blood cells and serve as the primary defence against infections by destroying bacteria in the blood.

Exclusions: Cartilage-hair hypoplasia (LD27.0)

4B00.01 Acquired neutropaenia

4B00.0Z Neutropaenia, unspecified

4B00.1 **Neutrophilia**

4B00.10 Constitutional neutrophilia

4B00.11 Acquired neutrophilia

Coding Note: Code also the causing condition

Exclusions: Non mast cell myeloproliferative neoplasms (2A20)

4B00.1Z Neutrophilia, unspecified

4B00.Y **Other specified disorders of neutrophil number**

4B01 **Disorders of neutrophil function**

Coded Elsewhere: Functional neutrophil defects (4A00.0)

4B01.0 **Constitutional disorders of neutrophil function**

4B01.00 Disorders of neutrophil adhesion

4B01.01 Disorders of neutrophil chemotaxis

4B01.02 Disorders of neutrophil granule formation or release

4B01.03 Disorders of neutrophil oxidative metabolism

4B01.0Y Other specified constitutional disorders of neutrophil function

4B01.0Z Constitutional disorders of neutrophil function, unspecified

4B01.1 Acquired disorders of neutrophil function

4B01.Z Disorders of neutrophil function, unspecified

4B02 **Eosinopenia**

4B02.0 Constitutional decrease in eosinophil number

4B02.1 Acquired decrease in eosinophil number

4B02.Z Eosinopenia, unspecified

4B03 **Eosinophilia**

4B03.0 Constitutional eosinophilia

4B03.1 Acquired eosinophilia

4B03.Z Eosinophilia, unspecified

4B04 **Disorders with decreased monocyte counts**

4B05 **Disorders with increased monocyte counts**

4B06 **Acquired lymphopenia**

4B07 **Acquired lymphocytosis**

Exclusions: Chronic lymphocytic leukaemia or small lymphocytic lymphoma (2A82.0)

Coded Elsewhere: Infectious mononucleosis (1D81)

4B0Y **Other specified immune system disorders involving white cell lineages**

4B0Z **Immune system disorders involving white cell lineages, unspecified**

Certain disorders involving the immune system (4B20-4B2Y)

Disorders in which disturbed immune regulation plays an important part but which cannot be more precisely located elsewhere in the classification.

Exclusions: Failure or rejection of transplanted organs or tissues (NE84)

Monoclonal gammopathy of undetermined significance (2A83.0)

Coded Elsewhere: Hereditary angioedema (4A00.14)

4B20 Sarcoidosis

Sarcoidosis is a multisystem disorder of unknown cause characterised by the formation of immune granulomas in involved organs. The lung and the lymphatic system are predominantly affected, but virtually every organ may be involved. Other severe manifestations result from cardiac, neurological, ocular, kidney or laryngeal localizations.

4B20.0 Sarcoidosis of lung

4B20.1 Sarcoidosis of lymph nodes

Lymphadenopathy is very common in sarcoidosis. Intrathoracic nodes are enlarged in 75 to 90% of all patients; usually this involves the hilar nodes, but the paratracheal nodes are commonly involved. Peripheral lymphadenopathy is very common, particularly involving the cervical (the most common head and neck manifestation of the disease), axillary, epitrochlear, and inguinal nodes.

4B20.2 Sarcoidosis of the digestive system

This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in the digestive system.

Coded Elsewhere: Gastritis due to sarcoidosis (DA42.Y)

Oesophagitis due to sarcoidosis (DA24.Y)

4B20.3 Neurosarcoidosis

This refers to sarcoidosis, a condition of unknown cause featuring granulomas in various tissues, involving the central nervous system (brain and spinal cord). It can have many manifestations, but abnormalities of the cranial nerves (a group of twelve nerves supplying the head and neck area) are the most common.

4B20.4 Ocular sarcoidosis

This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in multiple organs.

Coded Elsewhere: Uveoparotid fever (4B20.Y)

4B20.5 Cutaneous sarcoidosis

4B20.Y Other specified sarcoidosis

4B20.Z Sarcoidosis, unspecified

4B21 Polyclonal hypergammaglobulinaemia

4B22 **Cryoglobulinaemia**

Coded Elsewhere: Cryoglobulinaemic vasculitis (4A44.90)

Cutaneous microvascular disturbances due to monoclonal cryoglobulins (EF5Y)

4B23 **Immune reconstitution inflammatory syndrome**

This is a condition seen in some cases of AIDS or immunosuppression, in which the immune system begins to recover, but then responds to a previously acquired opportunistic infection with an overwhelming inflammatory response that paradoxically makes the symptoms of infection worse.

4B24 **Graft-versus-host disease**

Graft-versus-host disease (GVHD) occurs when lymphoid cells from an immunocompetent donor are introduced into a histo-incompatible recipient incapable of rejecting them. This usually occurs as a result of haematopoietic stem cell transplantation. The main targets attacked by the donor lymphocytes are the recipient's skin, gastrointestinal tract and liver. Acute GVHD, normally occurring within the first 100 days following transplantation, has a high mortality. The acute phase may be followed by chronic GVHD, which can also arise de novo. This usually presents as a lichenoid rash but can develop into a severe fibrosing disease affecting skin, lungs and liver.

4B24.0 Acute graft-versus-host disease

Graft-versus-host disease presenting normally within the first 100 days of engraftment. It presents most commonly with a maculopapular rash accompanied by fever. The prognosis correlates with the extent of skin involvement, which may progress to widespread epidermal necrolysis, and the severity of gastrointestinal and liver involvement which may manifest as diarrhoea and jaundice respectively. There is a high mortality in severe acute graft-versus-host disease.

4B24.1 Chronic graft-versus-host disease

Chronic graft-versus-host disease (GVHD) presents more than 100 days after engraftment of immunocompetent donor lymphoid cells. It has specific clinical features by which it can be distinguished from acute GVHD. It may arise de novo but frequently follows acute GVHD. Less commonly, it occurs concurrently with acute GVHD. The earlier stages of chronic GVHD are characterised by a widespread lichenoid rash, poikiloderma and involvement of nails and oral mucous membranes. If the disease remains active, progressive sclerosis of the skin and deeper tissues may result in joint contractures, fibrosis of internal organs and severe malabsorption.

4B24.Y Other specified graft-versus-host disease

4B24.Z Graft-versus-host disease, unspecified

4B2Y **Other specified disorders involving the immune system**

4B40 **Diseases of thymus**

Exclusions: thymic aplasia or hypoplasia with immunodeficiency (LD44.N0)

Myasthenia gravis (8C60)

Coded Elsewhere: Thymic tumours

4B40.0 Persistent hyperplasia of thymus

This refers to a persistent enlargement ("hyperplasia") of the thymus.

4B40.1 Abscess of thymus

4B40.2 Good syndrome

This is a condition that occurs in adults in whom hypogammaglobulinemia, deficient cell-mediated immunity, and benign thymoma may develop almost simultaneously.

4B40.Y Other specified diseases of thymus

4B40.Z Diseases of thymus, unspecified

4B4Y **Other specified diseases of the immune system**

4B4Z **Diseases of the immune system, unspecified**

CHAPTER 05

Endocrine, nutritional or metabolic diseases

This chapter has 148 four-character categories.

Code range starts with 5A00

This chapter includes endocrine diseases, nutritional diseases as well as metabolic diseases.

Exclusions: Transitory endocrine or metabolic disorders specific to fetus or newborn (KB60-KB6Z)

Pregnancy, childbirth or the puerperium (Chapter 18)

Coded Elsewhere: Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases (MA50-MA6Y)

Endocrine, nutritional or metabolic diseases complicating pregnancy, childbirth or the puerperium (JB64.2)

This chapter contains the following top level blocks:

- Endocrine diseases
- Nutritional disorders
- Metabolic disorders
- Postprocedural endocrine or metabolic disorders

Endocrine diseases (5A00-5B3Z)

Coded Elsewhere: Neoplasms of the endocrine system

Endocrine tumours

Disorders of the thyroid gland or thyroid hormones system (5A00-5A0Z)

Disorders due to dysfunction of thyroid gland and regulation systems of thyroid hormone actions including dysfunction of the pituitary, hypothalamus, or thyroid hormone receptors.

5A00 Hypothyroidism

5A00.0 Congenital hypothyroidism

Hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, and the condition arises at birth. Common clinical features include decreased activity and increased sleep, feeding difficulty and constipation, prolonged jaundice, myxedematous facies, large fontanels (especially posterior), macroglossia, a distended abdomen with umbilical hernia, and hypotonia.

Coded Elsewhere: Congenital central hypothyroidism (5A61.41)

5A00.00 Permanent congenital hypothyroidism with diffuse goitre

A condition caused by a partial or complete loss of thyroid function due to failure of the thyroid to correctly develop during the antenatal period. This condition is characterised by a swollen, smooth thyroid gland, and in infants by a dull look, puffy face, and thick tongue that sticks out. This condition may also present with choking episodes, constipation, dry brittle hair, jaundice, lack of muscle tone, low hairline, poor feeding, short height, sleepiness, or sluggishness.

Exclusions: transitory congenital goitre with normal function (KB62)

5A00.01 Permanent congenital hypothyroidism without goitre

This is a permanent congenital state in which the thyroid gland does not make enough thyroid hormone. This diagnosis is without swelling of the thyroid gland.

5A00.02 Pendred syndrome

Pendred syndrome is characterised by the association of congenital bilateral neurosensory deafness, thyroid goitre, cochleovestibular malformation and potential vestibular dysfunction.

5A00.03 Transient congenital hypothyroidism

Transient congenital hypothyroidism is defined as transient thyroid dysfunction with mildly elevated thyroid-stimulating hormone (TSH) and low thyroxine (FT4) levels which return to normal either very promptly and spontaneously, or after several months of thyroxine therapy. The disorder is due to a variety of causes including iodine deficiency or exposure to iodine-containing compounds, transplacental passage of blocking maternal antibodies, and dyshormonogenesis.

Exclusions: Transitory congenital goitre with normal function (KB62)

5A00.04 Congenital hypothyroidism due to iodine deficiency

Hypothyroidism is a condition which arises at birth where the thyroid gland produces too little or no thyroid hormone and it can be induced by iodine-deficiency.

Exclusions: Subclinical iodine-deficiency hypothyroidism (5A00.22)

5A00.0Y Other specified congenital hypothyroidism

5A00.0Z Congenital hypothyroidism, unspecified

5A00.1 **Iodine-deficiency-related thyroid disorders or allied conditions**

Any condition caused by aberrant thyroid function due to a deficiency of iodine. Confirmation is by blood test.

Exclusions: congenital iodine-deficiency syndrome (5A00.04)

Subclinical iodine-deficiency hypothyroidism (5A00.22)

5A00.10 Iodine-deficiency-related diffuse goitre

Diffuse enlargement of the thyroid gland due to Iodine-deficiency

5A00.11 Iodine-deficiency-related multinodular goitre

Multinodular enlargement of the thyroid gland due to Iodine-deficiency

Inclusions: Iodine-deficiency-related nodular goitre

5A00.1Z Iodine-deficiency-related thyroid disorders or allied conditions, unspecified

5A00.2 **Acquired hypothyroidism**

Acquired hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, and the condition arises only after birth.

Exclusions: Postprocedural hypothyroidism (5D40)

iodine-deficiency-related hypothyroidism (5A00.1)

Coded Elsewhere: Acquired central hypothyroidism (5A61.40)

Dementia due to acquired hypothyroidism (6D85.Y)

5A00.20 Hypothyroidism due to medicaments or other exogenous substances

A condition caused by an underactive thyroid due to a medicaments or other exogenous substances. This condition may present with fatigue, increased sensitivity to cold, constipation, dry skin, weight gain, muscle weakness, elevated blood cholesterol, muscle aches, joint pain or swelling, heavier or irregular menstrual periods, thinning hair, depression, or impaired memory.

5A00.21 Myxoedema coma

A life-threatening hypothyroid condition with long-standing severe untreated hypothyroidism in whom adaptive mechanisms fail to maintain homeostasis.

5A00.22 Subclinical iodine-deficiency hypothyroidism

A condition with elevated serum TSH level, but with normal thyroid hormone levels, which is induced by iodine-deficiency

5A00.2Y Other specified acquired hypothyroidism

5A00.2Z Acquired hypothyroidism, unspecified

5A00.Z **Hypothyroidism, unspecified**

5A01 Nontoxic goitre

Enlargement of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis

Exclusions: congenital goitre NOS (5A00.00)

congenital parenchymatous goitre (5A00.00)

iodine-deficiency-related goitre (5A00.1)

congenital diffuse goitre (5A00.00)

5A01.0 **Nontoxic diffuse goitre**

Diffuse enlargement of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis

5A01.1 **Nontoxic single thyroid nodule**

Single tumour of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis

5A01.2 **Nontoxic multinodular goitre**

Multiple nodules of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis

5A01.Z **Nontoxic goitre, unspecified**

5A02 **Thyrotoxicosis**

A hypermetabolic condition associated with elevated levels of free thyroxine and/or free triiodothyronine resulting in excess synthesis and secretion of thyroid hormone

Exclusions: Transitory neonatal hyperthyroidism (KB62.0)

Coded Elsewhere: Dysthyroid exophthalmos (9A20.00)

5A02.0 **Thyrotoxicosis with diffuse goitre**

Thyrotoxicosis occurs by the ingestion of excessive amounts of exogenous thyroid hormone in the form of thyroid hormone supplements such as the most widely used supplement levothyroxine.

Inclusions: Toxic diffuse goitre

Graves disease

5A02.1 **Thyrotoxicosis with toxic single thyroid nodule**

Inclusions: Thyrotoxicosis with toxic uninodular goitre

5A02.2 **Thyrotoxicosis with toxic multinodular goitre**

Thyrotoxicosis caused by functioning thyroid multinodules

5A02.3 **Thyrotoxicosis from ectopic thyroid tissue**

5A02.4 **Thyrotoxicosis factitia**

A condition of thyrotoxicosis caused by the ingestion of exogenous thyroid hormone

5A02.5 **Thyroid crisis**

Thyrotoxic crisis (or thyroid storm) is a rare but severe complication of hyperthyroidism, which may occur when a thyrotoxic patient becomes very sick or physically stressed.

Inclusions: Thyroid storm

5A02.6 **Secondary hyperthyroidism**

Overproduction of thyroid hormone in the thyroid gland induced by dysfunction of the pituitary gland or hypothalamus.

Coding Note: Code also the causing condition

Exclusions: Generalised resistance to thyroid hormone (5A05)

Selective pituitary resistance to thyroid hormone (5A02)

5A02.Y **Other specified thyrotoxicosis**

5A02.Z **Thyrotoxicosis, unspecified**

5A03 **Thyroiditis**

Thyroiditis is the inflammation of the thyroid gland. It includes acute and chronic forms of thyroiditis. Thyroiditis is usually caused by autoimmune reaction to the thyroid, resulting in inflammation and damage to the thyroid cells. The symptoms include fatigue, weight gain, depression, dry skin, and constipation.

Exclusions: Acquired hypothyroidism (5A00.2)

Thyrotoxicosis (5A02)

Coded Elsewhere: Postpartum thyroiditis (JB44.5)

5A03.0 Acute thyroiditis

Acute thyroiditis is a rare form of thyroiditis directly caused by an infection, frequently bacterial.

5A03.1 Subacute thyroiditis

A self-limited thyroiditis associated with a triphasic clinical course of hyperthyroidism, hypothyroidism, and return to normal thyroid function. It is thought to be caused by a viral infection.

Inclusions: de Quervain thyroiditis

giant-cell thyroiditis

granulomatous thyroiditis

Exclusions: Autoimmune thyroiditis (5A03.2)

5A03.2 Autoimmune thyroiditis

A chronic inflammatory disorder of the thyroid gland associated with abnormal circulatory antibodies.

5A03.20 Hashimoto thyroiditis

5A03.21 Painless thyroiditis

A destructive thyroiditis which has an autoimmune basis in the non-postpartum period. An inflammation of the thyroid gland characterised by transient hyperthyroidism, followed by hypothyroidism and then recovery.

5A03.2Y Other specified autoimmune thyroiditis

5A03.Y Other specified thyroiditis

5A03.Z Thyroiditis, unspecified

5A04 **Hypersecretion of calcitonin**

This is the process of elaborating, releasing, and oozing a 32-amino acid linear polypeptide hormone that is produced in humans primarily by the parafollicular cells (also known as C-cells) of the thyroid, and in many other animals in the ultimobranchial body.

Inclusions: Hypersecretion of thyrocalcitonin

C-cell hyperplasia of thyroid

5A05 **Generalised resistance to thyroid hormone**

Decreased thyroid hormone action, generally induced by mutation of thyroid hormone receptors.

5A06 **Sick-euthyroid syndrome**

5A0Y **Other specified disorders of the thyroid gland or thyroid hormones system**

5A0Z **Disorders of the thyroid gland or thyroid hormones system, unspecified**

Diabetes mellitus (5A10-5A2Y)

A metabolic disorder with heterogenous aetiologies which is characterised by chronic hyperglycaemia and disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin secretion, insulin action, or both.

Coded Elsewhere: Diabetes mellitus in pregnancy (JA63)

Neonatal diabetes mellitus (KB60.2)

5A10 **Type 1 diabetes mellitus**

Diabetes mellitus type 1 (type 1 diabetes, T1DM, formerly insulin dependent or juvenile diabetes) is a form of diabetes mellitus that results from destruction of insulin-producing beta cells, mostly by autoimmune mechanisms. The subsequent lack of insulin leads to increased blood and urine glucose.

Exclusions: Type 2 diabetes mellitus (5A11)

Diabetes mellitus, other specified type (5A13)

Diabetes mellitus in pregnancy (JA63)

Coded Elsewhere: Pre-existing type 1 diabetes mellitus in pregnancy (JA63.0)

5A11 **Type 2 diabetes mellitus**

Diabetes mellitus type 2 (formerly noninsulin-dependent diabetes mellitus (NIDDM) or adult-onset diabetes) is a metabolic disorder that is characterised by high blood glucose in the context of insulin resistance and relative insulin deficiency.

Inclusions: non-insulin-dependent diabetes of the young

Exclusions: Diabetes mellitus in pregnancy (JA63)

Diabetes mellitus, other specified type (5A13)

Idiopathic Type 1 diabetes mellitus (5A10)

Coded Elsewhere: Pre-existing type 2 diabetes mellitus in pregnancy (JA63.1)

5A12 **Malnutrition-related diabetes mellitus**

5A13 Diabetes mellitus, other specified type

Diabetes mellitus which cannot be classified as either Type 1 or Type 2 diabetes mellitus.

Exclusions: Diabetes mellitus in pregnancy (JA63)

Type 2 diabetes mellitus (5A11)

Idiopathic Type 1 diabetes mellitus (5A10)

5A13.0 Diabetes mellitus due to genetic defects of beta cell function

Other specified diabetes mellitus due to genetic defects of beta cell function is a form of diabetes, which is associated with monogenetic defects in beta-cell function.

5A13.1 Diabetes mellitus due to genetic defects in insulin action

Other specified diabetes mellitus due to genetic defects in insulin action is a form of diabetes, which results from genetically determined abnormalities of insulin action. The metabolic abnormalities associated with mutations of the insulin receptor may range from hyperinsulinemia and modest hyperglycaemia to severe diabetes.

5A13.2 Diabetes mellitus due to diseases of the exocrine pancreas

Other specified diabetes mellitus due to diseases of the exocrine pancreas is a form of diabetes, which caused by any process that diffusely injures the pancreas. Acquired processes include pancreatitis, trauma, infection, pancreatectomy, and pancreatic carcinoma. With the exception of that caused by cancer, damage to the pancreas must be extensive for diabetes to occur.

5A13.3 Diabetes mellitus due to endocrinopathies

Other specified diabetes mellitus due to endocrinopathies is a form of diabetes caused by several hormones (e.g., growth hormone, cortisol, glucagon, epinephrine), which antagonize insulin action. Excess amounts of these hormones (e.g., acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, respectively) can cause diabetes. This generally occurs in individuals with preexisting defects in insulin secretion, and hyperglycaemia typically resolves when the hormone excess is resolved.

5A13.4 Diabetes mellitus due to drug or chemical

Other specified diabetes mellitus due to drug or chemical is a form of diabetes, which is caused by drug or chemical substance that impairs insulin secretion and insulin action.

5A13.5 Diabetes mellitus due to uncommon forms of immune-mediated diabetes

Other specified diabetes mellitus due to uncommon forms of immune-mediated diabetes is a form of diabetes, which is caused by two known conditions. The stiff-man syndrome is an autoimmune disorder of the central nervous system characterised by stiffness of the axial muscles with painful spasms. Patients usually have high titres of the GAD autoantibodies, and approximately one-third will develop diabetes.

5A13.6 **Diabetes mellitus due to other genetic syndromes**

Other specified diabetes mellitus due to other genetic syndromes is a form of diabetes, which is associated with genetic syndromes.

Coding Note: Use additional code, if desired, to identify any associated genetic syndrome

Coded Elsewhere: Wolfram syndrome (5A61.5)

Maternally inherited diabetes and deafness (LD2H.Y)

Thiamine-responsive megaloblastic anaemia syndrome (5C63.Y)

Woodhouse-Sakati syndrome (5A61.0)

Mitochondrial myopathy with diabetes mellitus (8C73.Y)

5A13.7 **Diabetes mellitus due to clinically defined subtypes or syndromes**

Diabetes mellitus that has clinically defined subtypes or associated syndromes

5A13.Y **Diabetes mellitus due to other specified cause**

5A14 **Diabetes mellitus, type unspecified**

Exclusions: Idiopathic Type 1 diabetes mellitus (5A10)

Type 2 diabetes mellitus (5A11)

Diabetes mellitus, other specified type (5A13)

Diabetes mellitus in pregnancy (JA63)

Acute complications of diabetes mellitus (5A20-5A2Y)

5A20 **Diabetic hyperosmolar hyperglycaemic state**

Coding Note: Code also the causing condition

5A20.0 **Hyperosmolar hyperglycaemic state without coma**

Coding Note: Code also the causing condition

5A20.1 **Hyperosmolar hyperglycaemic state with coma**

Coding Note: Code also the causing condition

5A20.Z **Diabetic hyperosmolar hyperglycaemic state, unspecified**

Coding Note: Code also the causing condition

5A21 **Hypoglycaemia in the context of diabetes mellitus**

Coding Note: Code also the causing condition

5A21.0 **Hypoglycaemia in the context of diabetes mellitus without coma**

Coding Note: Code also the causing condition

5A21.1 **Hypoglycaemia in the context of diabetes mellitus with coma**

Coding Note: Code also the causing condition

5A21.Z **Hypoglycaemia in the context of diabetes, unspecified**

Coding Note: Code also the causing condition

5A22 **Diabetic acidosis**

Coding Note: Code also the causing condition

5A22.0 **Diabetic ketoacidosis without coma**

Coding Note: Code also the causing condition

5A22.1 **Diabetic lactic acidosis**

Coding Note: Code also the causing condition

5A22.2 **Diabetic metabolic acidosis**

Coding Note: Always assign an additional code for diabetes mellitus

5A22.3 **Diabetic ketoacidosis with coma**

Coding Note: Code also the causing condition

5A22.Y **Other specified diabetic acidosis**

Coding Note: Code also the causing condition

5A22.Z **Diabetic acidosis, unspecified**

Coding Note: Code also the causing condition

5A23 **Diabetic coma**

Coding Note: Code also the causing condition

5A24 **Uncontrolled or unstable diabetes mellitus**

Brittle diabetes mellitus is a term used to describe particularly hard-to-control Type 1 or Type 2 diabetes mellitus. It results in frequent, extreme swings in blood glucose levels, causing hyperglycaemia that could lead to ketoacidosis or hypoglycaemia.

Coding Note: Code also the causing condition

5A2Y **Other specified acute complications of diabetes mellitus**

Coding Note: Code also the causing condition

Other disorders of glucose regulation or pancreatic internal secretion (5A40-5A4Z)

Exclusions: Benign neoplasm of endocrine pancreas (2E92.9)
Multiple endocrine neoplasia type 1 (2F7A.0)
Malignant neoplasm of pancreas (2C10)

Coded Elsewhere: Somatostatinoma (2C10.1)
VIPoma (2C10.1)
PPoma (2C10.1)
GRFoma (2C10.1)

5A40 **Intermediate hyperglycaemia**

A metabolic disorder characterised by glucose levels too high to be considered normal, though not high enough to meet the criteria for diabetes.

Inclusions: prediabetes
Impaired glucose regulation

Exclusions: Diabetes mellitus, other specified type (5A13)
Idiopathic Type 1 diabetes mellitus (5A10)
Type 2 diabetes mellitus (5A11)
Diabetes mellitus, type unspecified (5A14)
Elevated blood glucose level (MA18.0)

Coded Elsewhere: Neonatal hyperglycaemia (KB60.3)

5A40.0 Impaired fasting glucose

Impaired glucose tolerance is a metabolic disorder with FPG 110–125 mg/dl (6.1–6.9 mmol/l).

5A40.1 Impaired glucose tolerance

Impaired glucose tolerance (IGT) is a metabolic disorder, which is characterised by 2-h postload glucose 140–199 mg/dl (7.8–11.1 mmol/l).

5A40.Y Other specified intermediate hyperglycaemia

5A40.Z Intermediate hyperglycaemia, unspecified

5A41 **Hypoglycaemia without associated diabetes**

Exclusions: Hypoglycaemia in the context of diabetes mellitus (5A21)

Coded Elsewhere: Neonatal hypoglycaemia (KB60.4)

5A42 **Increased secretion of glucagon**

Exclusions: Multiple endocrine neoplasia type 1 (2F7A.0)

Coded Elsewhere: Glucagonoma (2C10.1)

5A43 **Abnormal secretion of gastrin**

Coded Elsewhere: Gastrinoma (2C10.1)

5A43.0 Drug-induced hypergastrinaemia

A form of hypergastrinaemia that can be induced by drugs.

5A43.1 **Zollinger-Ellison syndrome**

A syndrome characterised by the presence of a gastrin-secreting tumour, usually in the pancreas or duodenum, resulting in increased gastric acidity and formation of gastric ulcers. Signs and symptoms include abdominal pain and diarrhea. It may be sporadic or a manifestation of multiple endocrine neoplasia type 1.

Coded Elsewhere: Anastomotic ulcer due to Zollinger-Ellison syndrome (DA62.Y)

Gastric ulcer due to Zollinger-Ellison syndrome (DA60.Y)

Duodenal ulcer due to Zollinger-Ellison syndrome (DA63.Y)

5A43.Y **Other specified abnormal secretion of gastrin**

5A43.Z **Abnormal secretion of gastrin, unspecified**

5A44 Insulin-resistance syndromes

Coding Note: Code also the causing condition

5A45 Persistent hyperinsulinaemic hypoglycaemia of infancy

Congenital isolated hyperinsulinism, or Persistent hyperinsulinaemic hypoglycaemia of infancy (PHHI) is defined by an inappropriate oversecretion of insulin by the endocrine pancreas that is responsible for profound hypoglycaemia, which requires aggressive medical and/or surgical treatment to prevent severe and irreversible brain damage. PHHI is a genetically heterogeneous disorder with two types of histological lesions: diffuse (DiPHHI) and focal (FoPHHI) which are clinically indistinguishable.

5A4Y Other specified disorders of glucose regulation or pancreatic internal secretion

5A4Z Disorders of glucose regulation or pancreatic internal secretion, unspecified

Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z)

Disorders of the parathyroids and parathyroid hormone system generally refer to conditions with inappropriate secretion and/or actions of parathyroid hormone that cause dysregulation of calcium metabolism.

Exclusions: Hypocalcaemic vitamin D dependent rickets (5C63.20)

Hypovitaminosis D (5B57)

Hyperphosphataemic familial tumoural calcinosis (5C54.1)

Hypocalcaemic vitamin D resistant rickets (5C63.21)

5A50 Hypoparathyroidism

Hypoparathyroidism is a condition with insufficient biological actions of parathyroid hormone due to impaired secretion of parathyroid hormone or refractoriness of target tissues to parathyroid hormone.

Exclusions: Postprocedural hypoparathyroidism (5D42)

tetany NOS (MB47.D)

Coded Elsewhere: Transitory neonatal hypoparathyroidism (KB64)

5A50.0 **Hypoparathyroidism due to impaired parathyroid hormone secretion**

Hypoparathyroidism due to impaired PTH secretion is a condition with low circulating PTH level and hypocalcaemia caused by being unable to secrete PTH from parathyroids in response to hypocalcaemia with pathological or functional defects in parathyroids.

Coded Elsewhere: CATCH 22 phenotype (LD44.N0)

5A50.00 Idiopathic hypoparathyroidism

Exclusions: Autoimmune polyendocrinopathy type 1 (5B00)

5A50.01 Secondary hypoparathyroidism

Coding Note: Code also the causing condition

5A50.02 Hypoparathyroidism due to destruction of the parathyroid glands

Dysfunction of parathyroid glands can be caused by several etiologies such as radiation, destruction of parathyroid glands by granulomatous disease or cancer infiltration, and deposition of iron or copper.

5A50.03 Autoimmune hypoparathyroidism

5A50.0Y Other specified hypoparathyroidism due to impaired parathyroid hormone secretion

5A50.0Z Hypoparathyroidism due to impaired parathyroid hormone secretion, unspecified

5A50.1 **Pseudohypoparathyroidism**

Pseudohypoparathyroidism is a condition with refractoriness to parathyroid hormone of its target tissues especially kidney that causes hypocalcaemia and hyperphosphataemia even in the presence of high circulating levels of biologically active parathyroid hormone.

5A50.Y **Other specified hypoparathyroidism**

5A50.Z **Hypoparathyroidism, unspecified**

5A51 **Hyperparathyroidism**

Hyperparathyroidism refers to overproduction of parathormone and s most frequently due to a tumour in one of the parathyroid glands. It may also occur in response to low calcium levels, as encountered in various situations such as vitamin D deficiency or chronic kidney disease.

Hyperparathyroidism results in weakening of the bones through loss of calcium.

Exclusions: Adult osteomalacia (FB83.2)

infantile and juvenile osteomalacia (5B57.0)

5A51.0 **Primary hyperparathyroidism**

Primary hyperparathyroidism is a condition with enhanced PTH secretion and high circulatory PTH level caused by abnormal parathyroid pathology such as adenoma, hyperplasia and cancer. Primary hyperparathyroidism usually causes hypercalcaemia by enhanced PTH actions.

5A51.1 **Secondary hyperparathyroidism**

Secondary hyperparathyroidism is a condition with enhanced PTH secretion and high circulatory PTH level caused by metabolic changes such and hypocalcaemia, hyperphosphatemia and low 1,25-dihydroxyvitamin D.

Coding Note: Code also the causing condition

Exclusions: secondary hyperparathyroidism of renal origin (GB90.4)

5A51.2 **Familial hypocalciuric hypercalcaemia**

Familial Hypocalciuric Hypercalcaemia (FHH) or benign familial hypercalcaemia is an autosomal dominant disorder of calcium metabolism that is often asymptomatic and that is biologically characterised by a significant but moderate hypercalcaemia. Serum levels of parathyroid hormone are normal or slightly increased, and urinary calcium excretion is relatively low for hypercalcaemia. CASR, GNA11 and AP2S1 have been identified as causative genes.

5A51.Y **Other specified hyperparathyroidism**

5A51.Z **Hyperparathyroidism, unspecified**

5A5Y Other specified disorders of the parathyroids or parathyroid hormone system

5A5Z Disorders of the parathyroids or parathyroid hormone system, unspecified

Disorders of the pituitary hormone system (5A60-5A6Z)

Clinical status with increased, decreased, or dysregulated secretion of pituitary hormones, which is caused by a variety of tumourous, non-tumourous, and genetic disorders.

5A60 Hyperfunction of pituitary gland

A disease characterised by hypersecretion of adenohypophyseal hormones such as growth hormone, pralactin, thyrotopin, luteinising hormone, follicle stimulating hormone or adrenocorticotropic hormone.

Clinical status with excessive production of one or more pituitary hormones, which is mostly caused by hormone-producing pituitary adenomas.

Exclusions: Nelson syndrome (5A70.3)

overproduction of pituitary ACTH (5A70.0)

overproduction of thyroid-stimulating hormone (5A02)

Cushing syndrome (5A70)

Multiple endocrine neoplasia type 1 (2F7A.0)

Multiple endocrine neoplasia type 4 (2F7A.0)

5A60.0 **Acromegaly or pituitary gigantism**

Acromegaly is an acquired disorder related to excessive production of growth hormone (GH) and characterised by progressive somatic disfigurement (mainly involving the face and extremities) and systemic manifestations. The main clinical features are broadened extremities (hands and feet), widened thickened and stubby fingers, and thickened soft tissue. The disease also has rheumatologic, cardiovascular, respiratory and metabolic consequences which determine its prognosis. In the majority of cases, acromegaly is related to a pituitary adenoma, either purely GH-secreting (60%) or mixed. Transsphenoidal surgery is often the first-line treatment. When surgery fails to correct GH/IGF-I hypersecretion, medical treatment with somatostatin analogs and/or radiotherapy can be used.

Inclusions: Overproduction of growth hormone

Exclusions: constitutional gigantism (5B12)

increased secretion from endocrine pancreas of growth hormone-releasing hormone (5A40-5A4Z)

Constitutional tall stature (5B12)

5A60.1 **Hyperprolactinaemia**

Increased peripheral blood levels of prolactin often associated with galactorrhea, sometimes associated with normal ovarian function, but often resulting in a spectrum of ovulatory dysfunction varying between short luteal phase (inadequate preovulatory follicular development), anovulatory cycles, amenorrhea and hypogonadotropic hypogonadism

Coded Elsewhere: Prolactinoma of pituitary gland (2F37.Y)

5A60.2 **Syndrome of inappropriate secretion of antidiuretic hormone**

Syndrome of inappropriate antidiuretic hormone (ADH) secretion (SIADH) is characterised by continued ADH secretion, leading to hyponatremia, hypoosmolality and natriuresis. Exact prevalence is unknown. The disease has been described in all age groups. SIADH is often associated with tumours, pulmonary disease, central nervous system disorders or exposure to drugs. Occasionally, it is found in patients with adrenal, thyroid or pituitary insufficiency. The disorder is caused by gain-of-function mutations in the gene encoding the vasopressin V2 receptor. Fluid restriction is the most common treatment. The outcome is related to the underlying and associated disorders.

5A60.20 Nephrogenic syndrome of inappropriate antidiuresis

5A60.2Y Other specified syndrome of inappropriate secretion of antidiuretic hormone

5A60.2Z Syndrome of inappropriate secretion of antidiuretic hormone, unspecified

5A60.3 **Central precocious puberty**

Central precocious puberty is defined as the onset of pubertal changes before 8 years of age in girls and before 9.5 years of age in boys due to the overproduction of gonadotropin-releasing hormone (GnRH) by the hypothalamus. It may be idiopathic with no apparent cause (90% of cases in girls, 50% of cases in boys) or secondary to a lesion (tumour or malformation) in the hypothalamus. Other causes may include traumatic brain injury, or genetic disorders, affecting behavioural and psychological development, and final body height.

5A60.Y **Other specified hyperfunction of pituitary gland**

5A60.Z **Hyperfunction of pituitary gland, unspecified**

5A61 **Hypofunction or certain other specified disorders of pituitary gland**

Clinical status with disordered function of the pituitary gland without excessive pituitary hormone production, which is caused by a variety of diseases

Exclusions: Postprocedural hypopituitarism (5D43)

Craniopharyngioma (2A00)

Coded Elsewhere: Non-secreting pituitary adenoma (2F37.0)

5A61.0 **Hypopituitarism**

A disorder manifesting a deficiency or decrease of one or more pituitary hormones, which is caused by a variety of diseases such as tumour, trauma/surgery, irradiation, inflammation and haemorrhage/infarction.

Inclusions: pituitary cachexia

pituitary short stature

Coded Elsewhere: Prader-Willi syndrome (LD90.3)

Argonz-del Castillo Syndrome (5A60.1)

5A61.1 **Adrenocorticotropic hormone deficiency**

Deficiency of adrenocorticotropic hormone (ACTH) resulting in functional hypocortisolism. Includes deficiency of corticotropin releasing hormone (CRH, CRF).

5A61.2 **Gonadotropin deficiency**

Deficiency of Luteinizing Hormone (LH), Follicle Stimulating Hormone (FSH) resulting in hypogonadism (male and female). Includes deficiency of Gonadotropin Releasing Hormone (GnRH, LHRH).

Exclusions: Ovarian dysfunction (5A80)

Testicular hypofunction (5A81.1)

5A61.3 **Growth hormone deficiency**

Deficiency of growth hormone in children, adolescents and adults. Includes deficiency of growth hormone releasing hormone (GHRH) and excess of central somatostatin, leading to growth hormone deficiency. Includes idiopathic, inborn and acquired forms of growth hormone deficiency.

Exclusions: Hypopituitarism (5A61.0)

5A61.4 **Thyroid stimulating hormone deficiency**

Deficiency of thyroid stimulating hormone (TSH), leading to secondary (pituitary) or tertiary (hypothalamic) hypothyroidism Includes deficiency of TSH releasing hormone (TRH).

5A61.40 Acquired central hypothyroidism

Central Hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, induced by dysfunction of either hypothalamus or pituitary.

5A61.41 Congenital central hypothyroidism

5A61.4Y Other specified thyroid stimulating hormone deficiency

5A61.4Z Thyroid stimulating hormone deficiency, unspecified

5A61.5 Central diabetes insipidus

Central diabetes insipidus (CDI) is a hypothalamus-pituitary disease characterised by polyuria and polydipsia due to a vasopressin (AVP) deficiency. The condition may be associated with deficient secretion of antidiuretic hormone (ADH) and is most frequently idiopathic (possibly due to autoimmune injury to the ADH-producing cells), or may be induced by trauma, pituitary surgery, or hypoxic or ischaemic encephalopathy.

Inclusions: ADH - [antidiuretic hormone secretion] deficiency

Exclusions: Nephrogenic diabetes insipidus (GB90.4A)

5A61.6 Oxytocin deficiency

Isolated oxytocin deficiency or oxytocin deficiency in combination with anterior and/or posterior pituitary deficiencies.

5A61.Y Other specified hypofunction or disorders of pituitary gland

5A6Z Disorders of the pituitary hormone system, unspecified

Disorders of the adrenal glands or adrenal hormone system (5A70-5A7Z)

Coded Elsewhere: Gonadotropin deficiency (5A61.2)

Growth hormone deficiency (5A61.3)

Thyroid stimulating hormone deficiency (5A61.4)

Oxytocin deficiency (5A61.6)

Adrenal incidentaloma (2F37.Y)

5A70 Cushing syndrome

Cushing syndrome results from excess of corticosteroid hormones in the body due to overstimulation of the adrenal glands by excessive amounts of the hormone ACTH, secreted either by a tumuor of the pituitary gland (Cushing's disease) or by a malignant tumour in the lung or elsewhere. Symptoms include weight gain, reddening of the face and neck, excess growth of body and facial hair, raised blood pressure, loss of mineral from the bones (osteoporosis), raised blood glucose levels, and sometimes mental disturbances.

5A70.0 Pituitary-dependent Cushing disease

Pituitary-dependent Cushing disease is caused by a pituitary tumour, generally benign (adenoma) but rarely malignant (carcinoma), which secretes adrenocorticotropin (ACTH) autonomously, leading to hypercortisolism. The condition is associated with increased morbidity and mortality that can be mitigated by treatments that result in sustained endocrine remission. Transsphenoidal pituitary surgery (TSS) remains the mainstay of treatment for this disease but requires considerable neurosurgical expertise and experience in order to optimize patient outcomes.

5A70.1 **Ectopic ACTH syndrome**

5A70.2 **Pseudo-Cushing syndrome**

This is a condition in which patients display the signs, symptoms, and abnormal hormone levels seen in Cushing's syndrome. However, pseudo-Cushing's syndrome is not caused by a problem with the hypothalamic-pituitary-adrenal axis as Cushing's is; it is an idiopathic condition.

5A70.3 **Nelson syndrome**

5A70.Y **Other specified Cushing syndrome**

5A70.Z **Cushing syndrome, unspecified**

5A71 Adrenogenital disorders

Disorders of the reproductive system resulting from pathologic androgen production secondary to abnormalities in cortisol and/or aldosterone production

5A71.0 **46,XX disorders of sex development induced by androgens of fetal origin**

This refers to 46,XX disorders of sex development induced by any natural or synthetic compound, usually a steroid hormone, that stimulates or controls the development and maintenance of male characteristics in vertebrates by binding to androgen receptors, of fetal origin.

5A71.00 Glucocorticoid resistance

Glucocorticoid resistance is a rare genetic endocrine condition characterised by generalised, partial, target tissue resistance to glucocorticoids. The clinical spectrum of the condition is broad, ranging from asymptomatic to severe cases of hyperandrogenism, fatigue and/or mineralocorticoid excess.

5A71.01 Congenital adrenal hyperplasia

Congenital adrenal hyperplasia (CAH) refers to a group of conditions associated with either complete (classical form) or partial (non-classical) anomalies in the biosynthesis of adrenal hormones. The condition is characterised by insufficient production of cortisol, or of aldosterone (classical form with salt wasting), associated with overproduction of adrenal androgens. In the classical form, metabolic decompensation (dehydration with hyponatraemia, hyperkalaemia and acidosis associated with mineralocorticoid deficiency, and hypoglycaemia associated with glucocorticoid deficiency) may be life-threatening from the neonatal period onwards. Genital variations may be noted at birth in affected females. Chronic hyperandrogenism may lead to accelerated growth during childhood, but advanced bone maturation may lead to a deficit in final height. Adults tend to be overweight and metabolic disturbances, bone anomalies and fertility problems may also be present. Non-classical forms are associated with later onset, during the peri- or postpubertal period, and manifest with signs of hyperandrogenism (acne, hirsutism, menstrual problems and infertility).

5A71.0Y Other specified 46,XX disorders of sex development induced by androgens of fetal origin

5A71.0Z 46,XX disorders of sex development induced by androgens of fetal origin, unspecified

5A71.1 **46,XX disorders of sex development induced by androgens of maternal origin**

This refers to 46,XX disorders of sex development induced by any natural or synthetic compound, usually a steroid hormone, that stimulates or controls the development and maintenance of male characteristics in vertebrates by binding to androgen receptors, of maternal origin.

5A71.Y **Other specified adrenogenital disorders**

5A71.Z **Adrenogenital disorders, unspecified**

5A72 Hyperaldosteronism

5A72.0 **Primary hyperaldosteronism**

5A72.1 **Secondary hyperaldosteronism**

Coding Note: Code also the causing condition

5A72.Z **Hyperaldosteronism, unspecified**

5A73 Hypoaldosteronism

Exclusions: Congenital adrenal hyperplasia (5A71.01)

5A74 Adrenocortical insufficiency

A condition in which the adrenal glands do not produce adequate amounts of steroid hormones, primarily cortisol. It may also include impaired production of aldosterone (a mineralocorticoid), which regulates sodium conservation, potassium secretion, and water retention and also accompanies impaired production of adrenal androgens.

Coded Elsewhere: Neonatal haemorrhage originating in adrenal gland (KA83.4)

X-linked adrenoleukodystrophy (5C57.1)

5A74.0 **Acquired adrenocortical insufficiency**

This is a acquired condition in which the adrenal glands do not produce adequate amounts of steroid hormones, primarily cortisol; but may also include impaired production of aldosterone (a mineralocorticoid), which regulates sodium conservation, potassium secretion, and water retention.

Exclusions: Amyloidosis (5D00)

Coded Elsewhere: Adrenocorticotropic hormone deficiency (5A61.1)

Tuberculous Addison disease (1B12.3)

5A74.1 **Adrenal crisis**

Adrenal crisis is a life-threatening condition that indicates severe adrenal insufficiency caused by insufficient levels of cortisol.

Coded Elsewhere: Waterhouse-Friderichsen syndrome (1C1C.1)

5A74.Y **Other specified adrenocortical insufficiency**

5A74.Z **Adrenocortical insufficiency, unspecified**

5A75 Adrenomedullary hyperfunction

Idiopathic overstimulation of the adrenal medulla resulting in pathologic epinephrine/norepinephrine-mediated sympathetic output

5A76 Certain specified disorders of adrenal gland

5A76.0 Premature adrenarche

Premature development of pubic and/or axillary hair without central or peripheral precocious puberty. Children show premature clinical and/or laboratory signs of androgen action without estrogen action.

Exclusions: Central precocious puberty (5A60.3)

Congenital adrenal hyperplasia (5A71.01)

Peripheral precocious puberty (5A92)

5A76.Y Other specified disorders of adrenal gland

5A7Z Disorders of the adrenal glands or adrenal hormone system, unspecified

Disorders of the gonadal hormone system (5A80-5A8Z)

Gonad has a capability to produce androgen and estrogen under the control by hypothalamic-pituitary- gonadal axis. Gonadal dysfunction is caused by either insufficient actions of gonadotropin or resistance to gonadotropin.

5A80 Ovarian dysfunction

Pathological processes of the OVARY

Exclusions: isolated gonadotropin deficiency (5A61.0)

Postprocedural ovarian failure (5D44)

Coded Elsewhere: Premature ovarian failure (GA30.6)

Hirsutism associated with hyperandrogenaemia (ED72.1)

Ovarian hyperstimulation syndrome (GA32.0)

HAIR-AN syndrome (5A44)

5A80.0 Clinical hyperandrogenism

Presence of hirsutism, acne or androgenic alopecia (scalp hair loss in women)

5A80.1 Polycystic ovary syndrome

Condition defined by the presence of at least 2 of the following 3 criteria: oligo/anovulation; clinical or biochemical signs of hyperandrogenism; presence of polycystic ovaries as identified by ultrasound.

Inclusions: Sclerocystic ovary syndrome

Exclusions: Polycystic ovary NOS (5A80.2)

5A80.2 Polycystic ovary

Ovary with increased size (> 7 mL) and stromal volume, and with increased number of follicles (12 or more measuring 2-0 mm in diameter), that may be present in women with PCOS, but also in women with normal ovulatory function and normal fertility (unilaterally or bilaterally).

Exclusions: Polycystic ovary syndrome (5A80.1)

5A80.3 Anovulation

lack of ovulation in the last 12 months, leading to amenorrhea, irregular or infrequent cycles

5A80.4 Oligo-ovulation

Oligo-ovulation (less than 4 ovulations in the last 12 months) not related to described categories of endocrine dysfunction. Excludes anovulation related to PCOS, hyperprolactinaemia or amenorrhea.

5A80.5 Diminished ovarian reserve

Condition characterised by ovaries with lower number of oocytes than expected for female chronologic age, marked by biochemical abnormalities (increased serum FSH levels, decreased serum AMH levels) and/or ultrasound findings (low antral follicle count) associated with ovarian ageing, reduced response to ovarian stimulation, and female infertility

5A80.Y Other specified ovarian dysfunction

5A80.Z Ovarian dysfunction, unspecified

5A81 Testicular dysfunction or testosterone-related disorders

Exclusions: isolated gonadotropin deficiency (5A61.0)

Klinefelter syndrome (LD50.3)

Postprocedural testicular hypofunction (5D45)

Azoospermia (GB04.0)

Oligospermia (GB04)

Coded Elsewhere: 46,XY gonadal dysgenesis (LD2A.1)

Testicular agenesis (LD2A.2)

46,XY disorder of sex development due to a defect in testosterone metabolism (LD2A.3)

46,XY disorder of sex development due to androgen resistance (LD2A.4)

46, XY disorders of sex development (LD2A.Y)

5A81.0 Testicular hyperfunction

A hypersecretion of testicular hormones.

Exclusions: McCune-Albright syndrome (FB80.0)

5A81.1 **Testicular hypofunction**

In pre-puberty, a disorder characterised by atrophied testes and sterility, abnormal height and absence of secondary sex characteristics. In post-puberty, a disorder characterised by depressed sexual function, loss of sex drive and sterility, muscle weakness and osteoporosis (due to loss of the androgen anabolic effect).

5A81.Y **Other specified testicular dysfunction or testosterone-related disorders**

5A81.Z **Testicular dysfunction or testosterone-related disorders, unspecified**

5A8Z **Disorders of the gonadal hormone system, unspecified**

Certain disorders of puberty (5A90-5A9Z)

Exclusions: Central precocious puberty (5A60.3)

5A90 **Disorder of puberty due to oestrogen resistance**

5A91 **Delayed puberty**

This is when an organism has passed the usual age of onset of puberty with no physical or hormonal signs that it is beginning. Puberty may be delayed for several years and still occur normally, in which case it is considered constitutional delay, a variation of healthy physical development. Delay of puberty may also occur due to malnutrition, many forms of systemic disease, or to defects of the reproductive system (hypogonadism) or the body's responsiveness to sex hormones.

Inclusions: Delayed sexual development

Constitutional delay of puberty

5A92 **Peripheral precocious puberty**

Precocious puberty without activation of the GnRH-/gonadotropin axis. It includes gonadal tumours with sex hormone production and it may be part of McCune-Albright's syndrome.

Inclusions: Precocious menstruation

Exclusions: female heterosexual precocious pseudopuberty (5A71)

male isosexual precocious pseudopuberty (5A71)

Central precocious puberty (5A60.3)

Congenital adrenal hyperplasia (5A71.01)

Coded Elsewhere: Testotoxicosis (5A81.0)

McCune-Albright syndrome (FB80.0)

5A9Y **Other disorders of puberty**

5A9Z **Disorders of puberty, unspecified**

Polyglandular dysfunction (5B00-5B0Z)

Exclusions: Ataxia-telangiectasia (4A01.31)

Pseudohypoparathyroidism (5A50.1)

dystrophia myotonica [Steinert] (8C71.0)

Coded Elsewhere: Multiple polyglandular tumours (2F7A.0)

5B00 **Autoimmune polyendocrinopathy**

This a subtype of autoimmune polyendocrine syndrome, in which multiple endocrine glands dysfunction as a result of autoimmunity. It is a genetic disorder attributed to a defect in the AIRE gene that normally confers immune tolerance. It is inherited in a recessive fashion.

Coded Elsewhere: X-linked immune dysregulation – polyendocrinopathy – enteropathy (4A01.21)

5B01 **Polyglandular hyperfunction**

5B0Y **Other specified polyglandular dysfunction**

5B0Z **Polyglandular dysfunction, unspecified**

Endocrine disorders, not elsewhere classified (5B10-5B1Y)

Exclusions: Pseudohypoparathyroidism (5A50.1)

5B10 **Carcinoid syndrome**

5B11 **Short stature, not elsewhere classified**

Exclusions: Progeria (LD2B)

Silver-Russell syndrome (LD2F.1)

short-limbed stature with immunodeficiency (4A01.10)

short stature hypochondroplastic (LD24.01)

short stature achondroplastic (LD24.00)

renal short stature (GB61)

pituitary related short stature (5A61.0)

Coded Elsewhere: Short stature due to growth hormone resistance (5A61.0)

5B12 **Constitutional tall stature**

Constitutional (familial) tall stature, a variant of the normal pattern of childhood growth and development, is defined as a condition in which the height of an individual is more than 2 SD above the corresponding mean height for a normal subject of the same age and gender. Distinguishing features are a family history of tall stature and lack of dimorphism or other clinical features suggesting pathologic causes of abnormally rapid growth.

Inclusions: Constitutional gigantism

5B1Y **Other specified endocrine disorders, not elsewhere classified**

5B3Y **Other specified endocrine diseases**

5B3Z **Endocrine diseases, unspecified**

Nutritional disorders (5B50-5C3Z)

Nutritional disorders in all their forms result from imbalances (excess or deficiency) in energy and/or specific macro and micronutrients. They occur when the intake of essential macronutrients and micronutrients does not meet or exceeds the metabolic demands for those nutrients. Metabolic demands vary with age and other physiological conditions, they are also affected by environmental circumstances, including poor hygiene and sanitation, which lead to diarrhea and other infections.

Coded Elsewhere: Nutritional or toxic disorders of the nervous system (8D40-8D4Z)

Undernutrition (5B50-5B7Z)

Undernutrition is a condition in which the body's requirements are unmet due to underconsumption or to impaired absorption and use of nutrients. It can be produced by lack of access to food, or as a consequence of illness. Undernutrition commonly refers to a deficit in energy intake, but can also refer to deficiencies of specific nutrients, and can be either acute or chronic.

Inclusions: Malnutrition NOS

Exclusions: slim disease (1C62.3)

starvation (NF07.0)

Intestinal malabsorption (DA96.0)

Anorexia Nervosa (6B80)

Coded Elsewhere: Malnutrition in pregnancy (JA64)

Fetal intrauterine malnutrition without mention of small for gestational age (KA20.2)

Undernutrition-dehydration cataract (9B10.2Y)

5B50 **Underweight in infants, children or adolescents**

5B51 **Wasting in infants, children or adolescents**

5B52 **Acute malnutrition in infants, children or adolescents**

5B53 **Stunting in infants, children or adolescents**

5B54 **Underweight in adults**

Body mass index (BMI) <18.5 kg/m^2

5B55 Vitamin A deficiency

Vitamin A deficiency (VAD) is defined as a state in which tissue concentrations of vitamin A are low enough to have adverse health consequences even if there is no evidence of clinical xerophthalmia. The term xerophthalmia encompasses the clinical spectrum of ocular manifestations of vitamin A deficiency, from milder stages of night blindness and Bitot's spots, to potentially blinding stages of corneal xerosis, ulceration and necrosis (keratomalacia). In addition to the specific signs and symptoms of xerophthalmia and the risk of irreversible blindness, nonspecific symptoms include increased morbidity and mortality, poor reproductive health, increased risk of anaemia, and contributions to slowed growth and development.

Inclusions: Hypovitaminosis A

Coded Elsewhere: Acquired vitamin A deficiency anaemia (3A03.5)

5B55.0 Vitamin A deficiency with night blindness

Night blindness (poor adaptation to darkness) is generally the earliest manifestation of vitamin A deficiency. In mild cases, night blindness is apparent only after photic stress. Affected children no longer move around after dusk and prefer to sit in a secure corner, often unable to find their food or toys. Night blindness of recent onset in a preschool child is practically pathognomonic of vitamin A deficiency. All patients respond rapidly to therapy with vitamin A, usually within 48 hours.

5B55.1 Vitamin A deficiency with conjunctival xerosis

In conjunctival xerosis the epithelium of the conjunctiva is transformed from the normal columnar to the stratified squamous type, with a resultant loss of goblet cells, formation of a granular cell layer, and keratinization of the surface. Clinically, these changes are expressed as marked dryness or unwettability, the affected area appearing roughened, with fine droplets or bubbles on the surface, rather than smooth and glistening. Conjunctival xerosis first appears in the temporal quadrant, as an isolated oval or triangular patch adjacent to the limbus in the interpalpebral fissure. It is almost always present in both eyes.

5B55.2 Vitamin A deficiency with conjunctival xerosis and Bitot's spots

Generalised conjunctival xerosis suggests advanced vitamin A deficiency. The entire conjunctiva appears dry, roughened, and corrugated, sometimes skin-like. In some individuals keratin and saprophytic bacilli accumulate on the xerotic surface, giving it a foamy or cheesy appearance. Such lesions are known as Bitot's spot. With treatment active conjunctival xerosis and Bitot's spot begin to resolve within 2-5 days. Most will disappear within 2 weeks, though a significant proportion of temporal lesions may persist, in shrunken form, for months.

5B55.3 Vitamin A deficiency with corneal xerosis

Clinically, the cornea develops classical xerosis, a hazy, lustreless, dry appearance, first apparent near the inferior limbus. Many children have characteristic superficial punctate lesions of the inferior-nasal aspects of their cornea that stain brightly with fluorescein. Early in the disease they are visible only through a slit-lamp examination. With more severe disease the punctate lesions become more numerous and spread upwards over the central cornea, and the corneal stroma becomes oedematous. Thick, keratinized plaques resembling Bitot's spot may form on the corneal surface. These are often densest in the interpalpebral zone. With treatment, these corneal plaques peel off, sometimes leaving superficial erosion which quickly heals. Corneal xerosis responds within 2-5 days to vitamin A therapy, the cornea regaining its normal appearance in 1-2 weeks.

5B55.4 Vitamin A deficiency with corneal ulceration or keratomalacia

Ulceration/keratomalacia indicates permanent destruction of part or all of the corneal stroma, resulting in permanent structural alteration. Ulcers are classically round to oval "punched-out" defects, as if a trephine or cork-borer had been applied to the eye. The surrounding cornea is generally xerotic but otherwise clear, and typically lacks the grey, infiltrated appearance of ulcers of bacterial origin. There may be more than one ulcer. Small ulcers are almost invariably confined to the periphery of the cornea, especially its inferior and nasal aspects. The ulceration may be shallow, but is commonly deep. Perforations become plugged with iris, thereby preserving the anterior chamber. In more advanced disease the necrotic stroma sloughs, leaving a large ulcer or descemetocele. As with smaller ulcers, this is usually peripheral and heals as a dense, white, adherent leukoma. With therapy, superficial ulcers often heal with surprisingly little scarring; deeper ulcers, especially perforations, form dense peripheral adherent leukomas.

5B55.5 Vitamin A deficiency with xerophthalmic scars of cornea or blindness

Xerophthalmia or "dry eye" remains the most important cause of childhood blindness in many developing countries. Healed sequelae of prior corneal disease related to vitamin A deficiency include opacities or scars of varying density (nebula, macula, leukoma), weakening and outpouching of the remaining corneal layers (staphyloma and descemetocele) and, where loss of intraocular contents has occurred, phthisis bulbi, a scarred shrunken globe. Such end-stage lesions are not specific for xerophthalmia and may arise from numerous other conditions, notably trauma and infection.

5B55.Y Vitamin A deficiency with other specified manifestations

5B55.Z Vitamin A deficiency, unspecified

5B56 Vitamin C deficiency

This condition groups several clinical consequences secondary to vitamin C deficiency with scurvy being the most severe presentation. The populations at risk of vitamin C deficiency are those for whom the fruit and vegetable supply is minimal. Epidemics of scurvy are associated with famine and war, when food supply is small and irregular. Children fed predominantly heat-treated (ultra-high-temperature or pasteurized) milk or unfortified formulas and not receiving fruits and fruit juices are at significant risk for symptomatic disease.

5B56.0 **Scurvy**

Scurvy is a disease caused by a lack of vitamin C (ascorbic acid) in the diet. Vitamin C plays a central role in collagen and ground-substance formation, metabolism of aromatic amino acids (phenylalanine, tyrosine), reduction of folic acid to folinic acid and a broad range of biochemical redox reactions. Clinical features include perifollicular haemorrhages, ecchymoses, swollen bleeding gums, stomatitis and epistaxis.

Coded Elsewhere: Scorbutic anaemia (3A03.2)

5B56.Y **Other specified vitamin C deficiency**

5B56.Z **Vitamin C deficiency, unspecified**

5B57 Vitamin D deficiency

Vitamin D is a fat-soluble vitamin contained naturally in very few foods, added to milk, available as a supplement, and produced endogenously with exposure to sunlight. Vitamin D deficiency can be caused by inadequate intake due to dietary factors (e.g., special diets (veganism), lactose intolerance or allergies) and/or limited exposure to sunlight due to geographic location, sun avoidance, or shiftwork. Severe deficiency results in disordered bone modelling called rickets in childhood (open growth plates), and osteomalacia in adults (fused growth plates).

5B57.0 **Vitamin D deficiency rickets**

Rickets is a disease of growing bone that is due to unmineralized matrix at the growth plates and occurs in children only before fusion of the epiphyses. There are many causes of rickets, including vitamin D disorders, calcium deficiency, phosphorous deficiency, and distal renal tubular acidosis. With the increased survival rate of very low birthweight infants, rickets in this age group has become a significant problem.

5B57.1 **Vitamin D deficiency osteomalacia**

Osteomalacia is a disorder of defective mineralization of newly formed osteoid at sites of bone turnover. Several different disorders cause osteomalacia via mechanisms that result in hypocalcaemia, hypophosphatemia, or direct inhibition of the mineralization process. Severe vitamin D deficiency, secondary to inadequate dietary intake, lack of sun exposure, gastric bypass or malabsorption (celiac disease), is the most common cause of osteomalacia in adults.

5B57.Y **Other specified vitamin D deficiency**

5B57.Z **Vitamin D deficiency, unspecified**

5B58 Vitamin E deficiency

Vitamin E deficiency is a condition that causes haemolysis and/or neurologic manifestations. Red blood cell fragility occurs and can produce a haemolytic anaemia. Neuronal degeneration produces peripheral neuropathies, ophthalmoplegia, and destruction of posterior columns of spinal cord. Neurologic disease is frequently irreversible if deficiency is not corrected early enough. Vitamin E deficiency may also contribute to the haemolytic anaemia and retrolental fibroplasia seen in premature infants.

Coded Elsewhere: Acquired vitamin E deficiency anaemia (3A03.6)

Dementia due to vitamin E deficiency (6D85.Y)

5B59 Vitamin K deficiency

Vitamin K is necessary for the synthesis of clotting factors II, VII, IX, and X, and deficiency of vitamin K can result in clinically significant bleeding. Vitamin K deficiency typically affects infants, who experience a transient deficiency related to inadequate intake, or patients of any age who have decreased vitamin K absorption. Mild vitamin K deficiency can affect long-term bone and vascular health.

Coded Elsewhere: Neonatal vitamin K deficiency (KA8F)

5B5A Vitamin B1 deficiency

Vitamin B1 deficiency manifests itself principally with changes involving the nervous system (polyneuritis and paralysis of the peripheral nerves), the cardiovascular system (cardiac insufficiency and generalised oedema), and also the gastrointestinal tract (constipation, vomiting, and abdominal pain).

5B5A.0 Beriberi

The clinical picture of Beriberi is usually divided into a dry (neuritic) type and a wet (cardiac) type. The disease is wet or dry depending on the amount of fluid which accumulates in the body due to factors like cardiac function, kidney lesions and others; even though the exact cause for this oedema has never been successfully explained. Many cases of thiamine deficiency show a mixture of the two main features and are more properly termed thiamine deficiency with cardiopathy and peripheral neuropathy. The infant shows signs of cyanosis and an acute cardiac attack can follow with the infant usually dying within 2 to 4 hours. The common age for this form of the deficiency disease is one month up through the third month. This type of deficiency responds very dramatically to thiamine.

5B5A.00 Dry beriberi

Neuritic form of Beri Beri

5B5A.01 Wet beriberi

Cardiac form of Beri Beri.

5B5A.0Z Beriberi, unspecified

5B5A.1 **Wernicke-Korsakoff Syndrome**

A thiamine-deficiency syndrome characterised by symmetric hyperaemic lesions of the brainstem, hypothalamus, thalamus, and mammillary bodies with glial proliferation, capillary dilatation, and perivascular haemorrhage. The syndrome is manifested by a confusional state, disorientation, ophthalmoplegia, nystagmus, diplopia, and ataxia (Wernicke encephalopathy), with severe loss of memory for recent events and confabulation (the invention of accounts of events to cover the loss of memory) (Korsakov psychosis) occurring following recovery. Defective binding of thiamine diphosphate by transketolase has been found. It appears that the disorder is of autosomal recessive inheritance but is expressed as clinical disease only in the event of thiamine deficiency.

Coding Note: Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.

Exclusions: Amnestic disorder due to use of alcohol (6D72.10)

5B5A.10 Wernicke encephalopathy

Wernicke's encephalopathy is an acute neuropsychiatric syndrome characterised by nystagmus, ophthalmoplegia, changes in the mental status, an uncoordinated gait and truncal ataxia. Wernicke's encephalopathy is usually accompanied or followed by Korsakoff's syndrome/Korsakoff's dementia (a continuum of Wernicke's encephalopathy characterised by severe memory defects, ataxia, apathy, disorientation, confabulations, hallucinations, paralysis of muscles controlling the eye and coma). The disorder results from a deficiency in vitamin B1, and mostly occurs in adults with a history of alcohol abuse or in patients with AIDS.

5B5A.11 Korsakoff syndrome

A disease of the nervous system, caused by deficiency of vitamin B1 in the brain. This disease commonly follows Wernicke encephalopathy, and may present with inability to form new memories, amnesia, confabulation, or hallucinations.

Coding Note: Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.

Exclusions: Amnestic disorder due to use of alcohol (6D72.10)

5B5A.1Y Other specified Wernicke-Korsakoff Syndrome

Coding Note: Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.

5B5A.1Z Wernicke-Korsakoff Syndrome, unspecified

Coding Note: Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.

5B5A.Y **Other specified vitamin B1 deficiency**

5B5A.Z **Vitamin B1 deficiency, unspecified**

5B5B

Vitamin B2 deficiency

The signs of riboflavin deficiency are sore throat, hyperaemia, oedema of the pharyngeal and oral mucous membranes, cheilosis, angular stomatitis, glossitis, seborrheic dermatitis, and normochromic normocytic anaemia associated with pure red cell cytoplasia of the bone marrow. The major cause of hyporiboflavinosis is inadequate dietary intake as a result of limited food supply, which is sometimes exacerbated by poor food storage or processing. Children in developing countries will commonly demonstrate clinical signs of riboflavin deficiency during periods of the year when gastrointestinal infections are prevalent. Decreased assimilation of riboflavin also results from abnormal digestion, such as that which occurs with lactose intolerance.

Inclusions: Riboflavin deficiency

Coded Elsewhere: Acquired riboflavin deficiency anaemia (3A03.41)

5B5C

Vitamin B3 deficiency

Niacin deficiency classically results in pellagra, which is a chronic wasting disease associated with a characteristic erythematous dermatitis that is bilateral and symmetrical, a dementia after mental changes including insomnia and apathy preceding an overt encephalopathy, and diarrhoea resulting from inflammation of the intestinal mucous surfaces. Pellagra occurs endemically in poorer areas of Africa, China and India.

Inclusions: Niacin deficiency NOS

5B5C.0 Pellagra

Pellagra is a potentially life-threatening disorder due to niacin deficiency and is observed in malnourished individuals, especially alcoholics, and as a complication of isoniazid therapy. The diagnosis is often overlooked or delayed. Pellagra manifests as diarrhoea, dermatitis, dementia, which usually appear in this order. Gastrointestinal tract symptoms always precede skin involvement, which presents initially with a sunburn-like blistering erythema, typically affecting the dorsal surfaces of the hands, face, neck, arms, and feet. With time the skin becomes thickened, scaly and pigmented.

5B5C.Y Other specified vitamin B3 deficiency

5B5D

Vitamin B6 deficiency

A deficiency of vitamin B6 alone is uncommon because it usually occurs in association with a deficit in other B-complex vitamins. Hypovitaminosis B6 may often occur with riboflavin (vitamin B2) deficiency. The classical clinical symptoms of vitamin B6 deficiency are a seborrheic dermatitis, microcytic anaemia, epileptiform convulsions, and depression and confusion. Infants are especially susceptible to insufficient intakes, which can lead to epileptiform convulsions. Moreover, there is usually a decrease in circulating lymphocytes and sometimes a normocytic, microcytic, or sideroblastic anaemia as well. As is the case with other micronutrient deficiencies, vitamin B6 deficiency results in an impairment of the immune system. Several medical conditions can also affect vitamin B6 metabolism and thus lead to deficiency symptoms.

Exclusions: Pyridoxine-responsive sideroblastic anaemia, not elsewhere classified (3A72.1)

Coded Elsewhere: Acquired pyridoxine deficiency anaemia (3A03.40)

Pyridoxine dependent epilepsy with antiquitin mutations (8A61.0Y)

5B5E

Folate deficiency

Nutritional deficiency of folate is common in people consuming a limited diet. This can be exacerbated by malabsorption conditions, including coeliac disease and tropical sprue. Pregnant women are at risk for folate deficiency because pregnancy significantly increases the folate requirement, especially during periods of rapid fetal growth (i.e. in the second and third trimester). During lactation, losses of folate in milk also increase the folate requirement. During pregnancy, there is an increased risk of fetal neural tube defects (NTDs), with risk increasing 10-fold as folate status goes from adequate to poor. Between days 21 and 27 post-conception, the neural plate closes to form what will eventually be the spinal cord and cranium. Spina bifida, anencephaly, and other similar conditions are collectively called NTDs. They result from improper closure of the spinal cord and cranium, respectively, and are the most common congenital abnormalities associated with folate deficiency.

5B5F

Vitamin B12 deficiency

Vegetarianism and poverty-imposed near-vegetarianism are the most common causes of nutritional cobalamin insufficiency worldwide in all age groups. In such populations, low maternal cobalamin status is associated with adverse pregnancy outcomes (preterm birth, intrauterine growth retardation, early recurrent miscarriage), neural tube defects, reduced neurocognitive performance in children, accelerated bone turnover, and low bone mineral density with fractures. Insufficient cobalamin intake is also seen in breast-fed infants of mothers with pernicious anaemia.

Inclusions: cobalamin deficiency

cyanocobalamin deficiency

Coded Elsewhere: Vitamin B12 deficiency anaemia due to low intake (3A01.2)

Vitamin B12 deficiency anaemia due to intrinsic factor deficiency (3A01.3)

Vitamin B12 deficiency anaemia due to intestinal disease (3A01.4)

Drug-induced vitamin B12 deficiency anaemia (3A01.5)

Acquired vitamin B12 deficiency anaemia (3A01.Y)

Dementia due to vitamin B12 deficiency (6D85.Y)

5B5G

Biotin deficiency

Isolated biotin deficiency is rare. Signs of biotin deficiency in humans have been demonstrated in individuals who consume raw egg white over long periods and in total parenteral nutrition (TPN) before biotin supplementation in patients with malabsorption. The clinical findings of biotin deficiency include dermatitis, conjunctivitis, alopecia, and central nervous system abnormalities. In adults fed raw egg white (which contains avidin, a protein that binds biotin with such high affinity that it renders it biounavailable) or receiving biotin-free TPN for months to years, thinning of hair, frequently with loss of hair colour, has been reported. Most adults with the deficiency demonstrate a red, scaly, skin rash, frequently around the eyes, nose, and mouth. Most of the adults have neurological symptoms, including depression, lethargy, hallucinations, and paraesthesia of the extremities.

5B5H

Pantothenic acid deficiency

Pantothenic deficiency is rare: only reported as a result of feeding semisynthetic diets or an antagonist to the vitamin. Experimental, isolated deficiency in humans produces fatigue, abdominal pain, vomiting, insomnia, and paraesthesias of the extremities.

5B5J

Choline deficiency

Choline deficiency is rare. Individuals fed with total parenteral nutrition (TPN) solutions lacking choline develop fatty liver and liver damage.

5B5K

Mineral deficiencies

Exclusions: Disorders of mineral absorption or transport (5C64)

Coded Elsewhere: Hypokalaemia (5C77)

Hypomagnesaemia (5C64.41)

5B5K.0 **Iron deficiency**

Iron deficiency is a state in which there is insufficient iron to maintain the normal physiological function of blood, brain and muscles. It can exist in the absence of anaemia if it has not lasted long enough or if it has not been severe enough to cause the haemoglobin concentration to fall below the threshold for the specific sex and age group. Iron deficiency is the most common nutritional deficiency.

Exclusions: Iron deficiency anaemia (3A00)

Coded Elsewhere: Acquired iron deficiency anaemia due to blood loss (3A00.0)

Acquired iron deficiency anaemia due to low intake (3A00.1)

Acquired iron deficiency anaemia due to decreased absorption (3A00.2)

Acquired iron deficiency anaemia due to increased requirement (3A00.3)

Acquired iron deficiency anaemia (3A00.Y)

Dementia due to iron deficiency (6D85.Y)

5B5K.1 **Calcium deficiency**

Hypocalcaemia is defined as a total serum calcium concentration of less than 8.4 mg/dl (2.1 mmol/litre) or an ionized calcium concentration of less than 4.48 mg/dl (1.12 mmol/litre). There are numerous causes of hypocalcaemia, being chronic kidney disease the most common cause. Other causes are: vitamin D deficiency, disorders associated with acquired or genetic hypoparathyroridism, including intravenous bisphosphonate therapy, post-thyroidectomy and post-parathyroidectomy, and acute pancreatitis. Hypocalcaemia may be associated with a spectrum of clinical manifestations, ranging from few symptoms if the hypocalcaemia is mild, to life-threatening seizures, refractory heart failure, or laryngospasm if it is severe. In addition to severity, the rate of development of hypocalcaemia and chronicity determine the clinical manifestations.

Exclusions: Disorders of calcium metabolism (5C64.5)

Coded Elsewhere: Neonatal hypocalcaemia (KB61.2)

Neonatal osteopenia (KB61.3)

Myopathy due to calcium deficiency (8D40.2)

5B5K.10 Tetany due to acute calcium deficiency

The hallmark of acute hypocalcaemia is tetany, which is characterised by neuromuscular irritability. The symptoms of tetany may be mild (peri-oral numbness, paresthesias of the hands and feet, muscle cramps) or severe (carpopedal spasm, laryngospasm, and focal or generalised seizures, which must be distinguished from the generalised tonic muscle contractions that occur in severe tetany). Other patients have less specific symptoms such as fatigue, hyperirritability, anxiety, and depression, and some patients, even with severe hypocalcaemia, have no neuromuscular symptoms. Factors that determine the variation in frequency and severity of symptoms include acid-base status (hypocalcaemia and alkalosis act synergistically to cause tetany), hypomagnesaemia, and potassium balance.

5B5K.1Y Other specified calcium deficiency

5B5K.1Z Calcium deficiency, unspecified

5B5K.2 Zinc deficiency

The clinical features of severe zinc deficiency in humans are growth retardation, delayed sexual and bone maturation, skin lesions, diarrhoea, alopecia, impaired appetite, increased susceptibility to infections mediated via defects in the immune system, and the appearance of behavioural changes. The effects of marginal or mild zinc deficiency are less clear. A reduced growth rate and impairments of immune defence are so far the only clearly demonstrated signs of mild zinc deficiency in humans. Other effects, such as impaired taste and wound healing, which have been claimed to result from a low zinc intake, are less consistently observed.

Coded Elsewhere: Neonatal nutritional zinc deficiency (5C64.21)

5B5K.3 Iodine deficiency

Iodine deficiency disorders (IDD), caused mainly by a low dietary supply of iodine, refer to all of the consequences of iodine deficiency in a population that can be prevented by ensuring that the population has an adequate intake of iodine. Iodine deficiency is the most frequent cause of preventable brain damage in childhood.

Coded Elsewhere: Iodine-deficiency-related thyroid disorders or allied conditions (5A00.1)

Acquired hypothyroidism (5A00.2)

Congenital hypothyroidism due to iodine deficiency (5A00.04)

5B5K.4 Fluorine deficiency

A condition caused by a deficiency of fluoride. Low Fluorine concentrations in an individual's dental plaque and enamel may result in an increased risk for dental caries at any age. Fluorine deficiencies might also show negative effects on human's bone health.

5B5K.5 Sodium chloride deficiency

Sodium and chloride are usually found together in most foods as sodium chloride, also termed salt. For that reason, the effects of sodium and chloride deficiency are considered together. Deficiency can be caused by poor intake or increased losses (e.g., diuretics increase the urinary excretion of water, sodium, and chloride; in cystic fibrosis the sodium and chloride content of sweat is very high; gastrointestinal losses are associated with diarrhoeal diseases, emesis, ostomy output and other causes).

5B5K.6 Copper deficiency

Dietary deficiency is rare; it has been observed in premature and low birthweight infants fed exclusively a cow's milk diet and in individuals on long-term total parenteral nutrition without copper. Clinical manifestations include depigmentation of skin and hair, neurologic disturbances, leukopenia, hypochromic microcytic anaemia, and skeletal abnormalities.

Coded Elsewhere: Copper deficiency anaemia (3A03.3)

5B5K.7 Selenium deficiency

Selenium deficiency is rare but has been observed in individuals on long-term total parenteral nutrition lacking selenium. Clinical manifestations of deficiency arising from such situations are uncommon and poorly defined. They include muscular weakness and myalgia with, in several instances, the development of congestive heart failure. The importance of selenium for thyroid hormone metabolism is evident from changes in the T3–T4 ratio which develop after relatively mild selenium depletion in infants and elderly subjects.

5B5K.8 Chromium deficiency

Deficiency in humans is only described in long-term total parenteral nutrition patients receiving insufficient chromium. Hyperglycaemia or impaired glucose tolerance occurs. Elevated plasma free fatty acid concentrations, neuropathy, encephalopathy, and abnormalities in nitrogen metabolism are also reported.

5B5K.9 Manganese deficiency

5B5K.A Molybdenum deficiency

Molybdenum functions as a cofactor for a limited number of enzymes in humans: sulphite oxidase, xanthine oxidase and aldehyde oxidase. A rare severe metabolic defect causing molybdenum cofactor deficiency and preventing these enzymes from being synthesized has been described. Few infants with such defects survive the first days of life, and those who survive have severe neurological abnormalities. Although molybdenum deficiency related to a dietary deficiency is extremely rare in humans, it has been described in long-term total parenteral nutrition as being secondary to the administration of sulphite. Symptoms include: tachycardia, headache, night blindness, irritability and coma. Biochemical changes can consist of elevated plasma and methionine concentration, low serum uric acid concentration, high urinary thiosulfate and low urinary uric acid and sulphate levels.

5B5K.B Vanadium deficiency

A biological role of vanadium in humans has not yet been identified.

5B5K.Y Other specified mineral deficiency

5B5K.Z Mineral deficiency, unspecified

Sequelae of malnutrition or certain specified nutritional deficiencies (5B60-5B6Z)

This refers to sequelae of malnutrition or certain specified nutritional deficiencies.

5B60 **Sequelae of protein-energy malnutrition**

This refers to a pathological condition resulting from protein-energy malnutrition.

5B61 **Sequelae of vitamin A deficiency**

This refers to a pathological condition resulting from vitamin A deficiency.

5B62 **Sequelae of vitamin C deficiency**

This refers to a pathological condition resulting from vitamin C deficiency.

5B63 **Sequelae of rickets**

Bowed legs and/or arms, knock-knees, deformities of the thoracic cage and/or spine and/or skeletal dysplasia secondary to chronic or advanced rickets

5B6Y **Other specified sequelae of malnutrition or certain specified nutritional deficiencies**

5B6Z **Sequelae of malnutrition or certain specified nutritional deficiencies, unspecified**

5B70 **Essential fatty acid deficiency**

Deficiency of EFA (linoleic acid, linolenic acid, arachidonic acid, docosapentaenoic acid, docosahexaenoic acid and eicosapentaenoic acid) can be caused by deficient intake, particularly, in rapidly growing infants (as preterm infants), in patients receiving parenteral nutrition without an adequate source of EFA, and in diseases with fat malabsorption. Clinical findings are: dermatitis, alopecia, and thrombocytopenia. The role of EFA during pregnancy and lactation has been highlighted, and the role of long-chain n-3 fatty acids as structural components for the development of the retinal function and central nervous system is now accepted. The prenatal period is a time of increased risk for omega-3 deficiency, as maternal tissue stores tend to decline as they are used for the developing fetus. Deficiency of n-3 EFA can affect growth, and cognitive and visual function in infants. The characteristic signs of deficiency attributed to the n-6 fatty acids are scaly skin rash, increased transepidermal water loss, reduced growth, and elevation of the plasma ratio of eicosatrienoic acid: arachidonic acid. EFA deficiency in special populations has been linked to hematologic disturbances and diminished immune response. Long-chain n-3 and n-6 fatty acids are essential nutrients and also, as part of the overall fat supply may affect the prevalence and severity of cardiovascular disease, diabetes, cancer and age-related functional decline.

5B71 **Protein deficiency**

5B7Y **Other specified undernutrition**

5B7Z **Unspecified undernutrition**

Overweight, obesity or specific nutrient excesses (5B80-5C1Z)

Overweight or obesity (5B80-5B81.Z)

5B80 **Overweight or localised adiposity**

Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height^2 (m^2). The BMI categories for defining overweight vary by age and gender in infants, children and adolescents. For adults, overweight (or pre-obesity) is defined by a BMI ranging from 25.00 to 29.99 kg/m^2. Localized adiposity is a condition characterized by accumulation of adipose tissue in specific regions of the body independently of BMI.

5B80.0 **Overweight**

Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height² (m²). The BMI categories for defining overweight vary by age and gender in infants, children and adolescents. For adults, overweight (or pre-obesity) is defined by a BMI ranging from 25.00 to 29.99 kg/m².

5B80.00 Overweight in infants, children or adolescents

Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height² (m²). In infants, children and adolescents, BMI categories for defining overweight vary by age and gender based on WHO growth charts. Children 0 to 5 years are overweight if weight-for-length/height or BMI-for-age is above 2 and less than or equal to 3 standard deviations of the median of the WHO Child Growth Standards. Children 5 to 19 years are overweight if BMI-for-age is above 1 and less than or equal to 2 standard deviations of the median of WHO Growth Reference for School-aged Children and Adolescents .

5B80.01 Overweight in adults

5B80.0Z Overweight, unspecified

5B80.1 **Localised adiposity**

A condition characterised by accumulation of adipose tissue in specific regions of the body.

Coded Elsewhere: Benign symmetrical lipomatosis (EF02.1)

5B81 **Obesity**

Obesity is a chronic complex disease defined by excessive adiposity that can impair health. It is in most cases a multifactorial disease due to obesogenic environments, psycho-social factors and genetic variants. In a subgroup of patients, single major etiological factors can be identified (medications, diseases, immobilization, iatrogenic procedures, monogenic disease/genetic syndrome).

Body mass index (BMI) is a surrogate marker of adiposity calculated as weight (kg)/height² (m²). The BMI categories for defining obesity vary by age and gender in infants, children and adolescents. For adults, obesity is defined by a BMI greater than or equal to 30.00 kg/m². There are three levels of severity in recognition of different management options.

Coded Elsewhere: Obesity hypoventilation syndrome (7A42.0)

Syndromes with obesity as a major feature (LD29)

5B81.0 **Obesity due to energy imbalance**

Obesity is a chronic complex disease defined by excessive adiposity that can impair health. It is in most cases a multifactorial disease due to obesogenic environments, psycho-social factors and genetic variants. In a subgroup of patients, single major etiological factors can be identified (diseases, immobilization, iatrogenic procedures, monogenic disease/genetic syndrome).

5B81.00 Obesity in children or adolescents

In infants, children and adolescents, BMI categories for defining obesity vary by age and gender based on WHO growth charts. Children 0 to 5 years have obesity if weight-for-length/height or BMI-for-age is above 3 standard deviations of the median of the WHO Child Growth Standards.

Children aged 5 to 19 years have obesity if BMI-for-age is above 2 standard deviations of the median of WHO Growth Reference for School-aged Children and Adolescents.

5B81.01 Obesity in adults

Obesity is defined as a body mass index (BMI) greater than or equal to 30.00 kg/m^2. There are three levels of severity in recognition of different management options.

5B81.1 Drug-induced obesity

5B81.Y Other specified obesity

5B81.Z Obesity, unspecified

Certain specified nutrient excesses (5B90-5B9Z)

Any disease caused by an excess of specific nutrients. Confirmation is by blood test.

5B90 Vitamin excesses

5B90.0 Hypervitaminosis A

Because vitamin A is fat soluble and can be stored, primarily in the liver, routine consumption of large amounts of vitamin A over a period of time can result in toxic symptoms, including liver damage, bone abnormalities and joint pain, alopecia, headaches, vomiting, and skin desquamation. Hypervitaminosis A appears to be due to abnormal transport and distribution of vitamin A and retinoids caused by overloading of the plasma transport mechanisms. Very high single doses can cause transient acute toxic symptoms that may include bulging fontanelles in infants; headaches in older children and adults; and vomiting, diarrhoea, loss of appetite, and irritability in all age groups. Rarely does toxicity occur from ingestion of food sources of preformed vitamin A. When this occurs, it usually results from very frequent consumption of liver products.

Coded Elsewhere: Pseudotumour Cerebri related to Hypervitaminosis A (8D41.2)

5B90.1 Hypercarotenaemia

Excessive intake of carotenoids is not associated with toxicity but can cause yellow coloration of the skin that disappears when intake is reduced. This disorder is especially likely to occur in children with liver disease, diabetes mellitus or hypothyroidism, and in those who do not have enzymes that metabolize carotenoids.

5B90.2 **Hypervitaminosis D**

Hypervitaminosis D is secondary to excessive intake of vitamin D. It can occur with long-term high intake or with a substantial, acute ingestion. Excess amounts result in abnormally high concentrations of calcium and phosphate in the serum. The signs and symptoms of vitamin D intoxication are secondary to hypercalcaemia. Gastrointestinal manifestations include nausea, vomiting, constipation, abdominal pain and pancreatitis. Possible cardiac findings are hypertension, decreased Q-T interval and arrhythmias. The central nervous system effects of hypercalcaemia include lethargy, hypotonia, confusion, disorientation, depression, psychosis, hallucinations and coma. Hypercalcaemia impairs renal concentrating mechanisms, which can lead to polyuria, dehydration and hypernatremia. Hypercalcaemia can also lead to acute renal failure, nephrolithiasis and nephrocalcinosis, which can result in chronic renal insufficiency. Deaths are usually associated with arrhythmias or dehydration.

5B90.3 **Megavitamin-B6 syndrome**

A disease caused by an excess of vitamin B6. This disease is characterised by progressive sensory ataxia, diminished or absent tendon reflexes, and impaired sense of touch, temperature and pain. Confirmation is by blood test.

Coded Elsewhere: Peripheral neuropathy due to vitamin B6 hyperalimentation (8D41.0)

5B90.Y **Other specified vitamin excess**

5B90.Z **Unspecified vitamin excesses**

5B91 Mineral excesses

Coded Elsewhere: Hyperkalaemia (5C76)

Iron overload diseases (5C64.10)

5B91.0 **Hypercalcaemia**

Hypercalcaemia is a condition caused by increased calcium levels. The higher the calcium levels and the faster its level rises, the more severe will be the symptoms. When present, symptoms are caused by dehydration secondary to urinary losses of calcium, water and other electrolytes, and to an increase in membrane potential caused by the elevation in extracellular fluid ionized calcium concentration. Patients with moderate to severe hypercalcaemia often complain of nausea and vomiting, symptoms likely related to dehydration as well as to the effects of the hypercalcaemia on central nervous system function. Because hypercalcaemia tends to hyperpolarize membranes, a range of neurologic and neuromuscular signs and symptoms can occur. Patients with mild hypercalcaemia often complain of fatigue, depressed mood and asthenia. Gastrointestinal motility is impaired; this commonly results in constipation.

Coded Elsewhere: Myopathy due to hypercalcaemia (8D41.1)

5B91.1 Zinc excess

Adverse effects associated with chronic intake of supplemental zinc include suppression of immune response, decrease in high-density lipoprotein (HDL) cholesterol and reduced copper status. Acute adverse effects of excess zinc include epigastric pain, nausea, vomiting, loss of appetite, abdominal cramps, diarrhoea, headaches and gastrointestinal distress.

Coded Elsewhere: Myelopathy due to excess of zinc (8D41.Y)

5B91.2 Sodium chloride excess

The main adverse effect of increased sodium chloride in the diet is increased blood pressure, which is a major risk factor for cardiovascular-renal diseases. However, evidence from a variety of studies, including observational studies and clinical trials, has demonstrated heterogeneity in the blood pressure responses to sodium intake. Those individuals with the greatest reductions in blood pressure in response to decreased sodium intake are termed “salt sensitive”.

5B91.3 Fluorine excess

The primary adverse effects associated with chronic, excess fluoride intake are enamel and skeletal fluorosis. Enamel fluorosis is a dose-response effect caused by fluoride intake during the pre-eruptive development of teeth. The development of skeletal fluorosis and its severity is directly related to the level and duration of exposure. The clinical signs in advanced stages may include dose-related calcification of ligaments, osteosclerosis, exostoses, possibly osteoporosis of long bones, muscle wasting and neurological defects due to hypercalcification of vertebrae.

Coded Elsewhere: Dental enamel fluorosis (DA07.0)

5B91.4 Aluminium excess

Patients receiving long-term parenteral nutrition are at increased risk of aluminium toxicity because of bypass of the gastrointestinal tract during parenteral nutrition infusion. Complications of aluminium toxicity include metabolic bone disease, aluminium-associated encephalopathy in adults and impaired neurological development in preterm infants.

5B91.5 Manganese excess

Manganese toxicity in humans is a well-recognised occupational hazard for people who inhale manganese dust. High concentrations of circulating manganese as a result of total parenteral nutrition have also been associated with manganese toxicity. People with chronic liver disease have neurological pathology and behavioural signs of manganese neurotoxicity, probably because elimination of manganese in bile is impaired. The most prominent effect is central nervous system pathology, especially in the extra-pyramidal motor system. The lesions and symptoms are similar to those of Parkinson’s disease.

Coded Elsewhere: Dementia or parkinsonism due to manganese toxicity (6D84.Y)

5B91.Y Other specified mineral excess

5B91.Z Unspecified mineral excess

5B9Y Other specified nutrient excesses

5B9Z **Certain specified nutrient excesses, unspecified**

5C1Y **Other specified overweight, obesity or specific nutrient excesses**

5C1Z **Overweight, obesity or specific nutrient excesses, unspecified**

5C3Y **Other specified nutritional disorders**

5C3Z **Nutritional disorders, unspecified**

Metabolic disorders (5C50-5D2Z)

Exclusions: androgen resistance syndrome (LD2A.4)
Congenital adrenal hyperplasia (5A71.01)
Ehlers-Danlos syndrome (LD28.1)
Hereditary haemolytic anaemia due to enzyme deficiency (3A10)
Marfan syndrome (LD28.01)
5-alpha-reductase deficiency (5A81.1)

Coded Elsewhere: Cystic fibrosis (CA25)
Metabolic disorders following abortion, ectopic or molar pregnancy (JA05.5)

Inborn errors of metabolism (5C50-5C5Z)

Inborn errors of metabolism comprise a large class of genetic diseases involving disorders of metabolism. The majority are due to defects of single genes that code for enzymes that facilitate conversion of various substances (substrates) into others (products).

Exclusions: Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z)

5C50 **Inborn errors of amino acid or other organic acid metabolism**

5C50.0 Phenylketonuria

Phenylketonuria is a hereditary metabolic disease, characterised by deficiency of phenylalanine hydroxylase, an enzyme necessary for the transformation of phenylalanine into tyrosine. Untreated, phenylketonuria leads to mental retardation, sometimes profound, as well as hypopigmentation. Dietary phenylalanine restriction allows patients to lead almost normal lives.

5C50.00 Classical phenylketonuria

Classical phenylketonuria is a severe form of phenylketonuria (PKU,) an inborn error of amino acid metabolism characterised in untreated patients by severe intellectual deficit and neuropsychiatric complications.

5C50.01 Nonclassical phenylketonuria

Mild phenylketonuria is a rare form of phenylketouria (PKU,), an inborn error of amino acid metabolism, characterised by symptoms of PKU of mild to moderate severity.

5C50.02 Embryofetopathy due to maternal phenylketonuria

Maternal phenylalaninaemia refers to developmental anomalies that may occur in offspring of women affected by phenylketonuria (PKU), and include fetal development disorders, including microcephaly, intrauterine growth retardation, and subsequent intellectual deficit, and embryo development disorders such as heart defects (usually conotruncal), corpus callosus agenesis, neuronal migration disorders, facial dysmorphism and more rarely cleft palate, tracheo-oesophageal abnormalities.

5C50.0Y Other specified phenylketonuria

5C50.0Z Phenylketonuria, unspecified

5C50.1 **Disorders of tyrosine metabolism**

Coded Elsewhere: Transitory tyrosinaemia of newborn (KB63.4)

Autosomal recessive dopa-responsive dystonia (8A02.11)

Oculocutaneous albinism type 1A (EC23.20)

Oculocutaneous albinism type 1B (EC23.20)

5C50.10 Alkaptonuria

Alkaptonuria is characterised by the accumulation of homogentisic acid (HGA) and its oxidised product benzoquinone acetic acid (BQA), leading to a darkening of the urine when it is left exposed to air, grey-blue colouration of the eye sclerae and the ear helix (ochronosis), and a disabling joint disease involving both the axial and peripheral joints (ochronotic arthropathy).

5C50.11 Tyrosinaemia type 1

Tyrosinemia type 1 is an inborn error of amino acid metabolism characterised by hepatorenal manifestations. The early-onset acute form of the disorder manifests between 15 days and 3 months after birth with hepatocellular necrosis. Septicaemia is a frequent complication. Renal tubular dysfunction occurs and is associated with phosphate loss and hypophosphatemic rickets. A later onset form has also been described and manifests with vitamin-resistant rickets caused by renal tubular dysfunction.

5C50.12 Tyrosinaemia type 2

Tyrosinemia type 2 is an inborn error of tyrosine metabolism characterised by hypertyrosinemia with oculocutaneous manifestations (eye redness, photophobia, excessive tearing and pain, palmoplantar hyperkeratosis) and, in some cases, intellectual deficit.

5C50.1Y Other specified disorders of tyrosine metabolism

5C50.1Z Disorders of tyrosine metabolism, unspecified

5C50.2 **Disorders of histidine metabolism**

Coded Elsewhere: Formiminoglutamic aciduria (3A02.Y)

5C50.20 Histidinaemia

Histidinemia is a disorder of histidine metabolism caused by a defect in histidase, and seems to be benign in most affected individuals.

5C50.21 Urocanic aciduria

This is an autosomal recessive metabolic disorder caused by a deficiency of the enzyme urocanase. It is a secondary disorder of histidine metabolism.

5C50.2Y Other specified disorders of histidine metabolism

5C50.2Z Disorders of histidine metabolism, unspecified

5C50.3 **Disorders of tryptophan metabolism**

Exclusions: Hartnup disease (5C60)

5C50.4 **Disorders of lysine or hydroxylysine metabolism**

Exclusions: Refsum disease (5C57.1)

Zellweger syndrome (5C57.0)

Glutaryl-CoA dehydrogenase deficiency (5C50.E1)

5C50.5 **Disorders of the gamma-glutamyl cycle**

Coded Elsewhere: Haemolytic anaemia due to glutathione synthetase deficiency (3A10.0Y)

Haemolytic anaemia due to gamma-glutamylcysteine synthetase deficiency (3A10.0Y)

5C50.6 **Disorders of serine metabolism**

5C50.7 **Disorders of glycine metabolism**

5C50.70 Glycine encephalopathy

Isolated nonketotic hyperglycinemia is an inborn disorder of glycine metabolism which onset is generally neonatal with coma, severe hypotonia, myoclonic seizures, and microcephaly, usually progressing to severe intellectual deficit and tetrapyramidal syndrome.

5C50.71 Sarcosinaemia

Sarcosinaemia is a metabolic disorder characterised by an increased concentration of sarcosine in plasma and urine due to sarcosine dehydrogenase deficiency. Prevalence has been estimated at 1:28,000 to 1:350,000 in newborn screening programs. Sarcosinaemia is most probably a benign condition without significant clinical problems. It is transmitted in an autosomal recessive manner. Mutations in the gene for sarcosine dehydrogenase, located on chromosome 9q34, have been associated with this deficiency.

5C50.7Y Other specified disorders of glycine metabolism

5C50.7Z Disorders of glycine metabolism, unspecified

5C50.8 **Disorders of proline or hydroxyproline metabolism**

5C50.9 **Disorders of ornithine metabolism**

Coded Elsewhere: Hyperornithinaemia-hyperammonaemia-homocitrullinuria (5C50.AY)

Ornithine carbamoyltransferase deficiency (5C50.AY)

5C50.A **Disorders of urea cycle metabolism**

Exclusions: Disorders of ornithine metabolism (5C50.9)

Lysinuric protein intolerance (5C60)

5C50.A0 Argininosuccinic aciduria

Arginosuccinicaciduria is an autosomal recessive inherited deficiency of arginosuccinate lyase, an enzyme involved in the urea cycle that leads to severe hyperammonemic coma in neonates or, in childhood, to hypotonia, growth failure, anorexia and chronic vomiting or behavioural disorders. Onset can also occur later with hyperammonemic coma or behavioural disorders that simulate psychiatric disorders.

5C50.A1 Carbamoylphosphate synthetase deficiency

Carbamyl phosphate synthetase deficiency is an urea cycle disorder strictly limited to the liver and intestine that results in congenital hyperammonemia and defective citrulline synthesis.

5C50.A2 Argininaemia

Arginase deficiency is a rare autosomal recessive amino acid metabolism disorder characterised clinically by variable degrees of hyperammonemia, developing from about 3 years of age, and leading to progressive loss of developmental milestones and spasticity in the absence of treatment.

5C50.A3 Citrullinaemia

5C50.AY Other specified disorders of urea cycle metabolism

5C50.AZ Disorders of urea cycle metabolism, unspecified

5C50.B **Disorders of methionine cycle or sulphur amino acid metabolism**

Coded Elsewhere: Hereditary megaloblastic anaemia due to transcobalamin deficiency (3A01.0)

5C50.C **Disorders of beta or omega amino acid metabolism**

Exclusions: 4-hydroxybutyric aciduria (5C50.E1)

Coded Elsewhere: Gamma aminobutyric acid transaminase deficiency (5C59.1)

5C50.D **Disorders of branched-chain amino acid metabolism**

Exclusions: Methylmalonic acidaemia (5C50.E0)

Propionic acidaemia (5C50.E0)

Isovaleric acidaemia (5C50.E0)

3-methylglutaconic aciduria (5C50.E0)

Developmental delay due to 2-methylbutyryl-CoA dehydrogenase deficiency (5C50.E0)

3-hydroxyisobutyric aciduria (5C50.E0)

5C50.D0 Maple-syrup-urine disease

Maple syrup urine disease (MSUD) is a disorder of branched-chain amino acids metabolism. Four forms are described. The early onset classic form manifests after birth by lethargy, poor feeding and neurological signs of intoxication. Clinical course without treatment is characterised by deepening coma with maple syrup odour of urine. Subacute MSUD manifests later with encephalopathy, mental disability, major hypotonia, opisthotonus and cerebral atrophy with severe outcome. The intermittent form of MSUD may manifest at any age and presents with repeated ketoacidotic coma. Thiamine-responsive MSUD is a very rare form characterised by improvement of the biochemical profile with thiamine therapy.

5C50.DY Other specified disorders of branched-chain amino acid metabolism

5C50.DZ Disorders of branched-chain amino acid metabolism, unspecified

5C50.E **Organic aciduria**

An inborn error of metabolism disrupting normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids, which are usually not present

5C50.E0 Classical organic aciduria

This a term used to classify a group of metabolic disorders which disrupt normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids which are usually not present.

Coded Elsewhere: Ketoacidosis due to beta-ketothiolase deficiency (5C50.DY)

5C50.E1 Cerebral organic aciduria

This is a term used to classify a group of metabolic disorders which disrupt normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids which are usually not present.

5C50.EY Other specified organic aciduria

5C50.EZ Organic aciduria, unspecified

5C50.F **Disorders of peptide metabolism**

A condition which refers to inborn errors in peptide metabolism.

Exclusions: Disorders of gamma aminobutyric acid metabolism (5C59.1)

5C50.F0 Prolidase deficiency

Prolidase deficiency is a very rare inborn error of metabolism characterised by mild to severe skin lesions particularly on the face, palms, lower legs and soles, together with other variable features.

5C50.F1 Carnosinaemia

Carnosinaemia is a very rare inherited disorder of the metabolism of peptides that presents with serum carnosinase deficiency, variable degrees of intellectual deficit, sometimes with seizures, while a few patients are asymptomatic.

5C50.F2 Homocarnosinosis

Homocarnosinosis is a metabolic defect characterised by progressive spastic diplegia, intellectual deficit and retinitis pigmentosa. This extremely rare disorder has been reported in only one family, namely a woman and three of her children. The latter showed but their mother was symptom free. It is therefore uncertain whether there is a relationship between the biochemical defect and the clinical symptoms. Inheritance in the reported family seems to be autosomal dominant.

5C50.FY Other specified disorders of peptide metabolism

5C50.FZ Disorders of peptide metabolism, unspecified

5C50.G **Trimethylaminuria**

Trimethylaminuria is a metabolic disorder characterised by a body malodour similar to that of decaying fish.

Inclusions: Fish odour syndrome

5C50.Y **Other specified inborn errors of amino acid or other organic acid metabolism**

5C50.Z **Inborn errors of amino acid or other organic acid metabolism, unspecified**

5C51 Inborn errors of carbohydrate metabolism

Exclusions: Increased secretion of glucagon (5A42)

Diabetes mellitus (5A10-5A2Y)

hypoglycaemia NOS (5A41)

Mucopolysaccharidosis (5C56.3)

Coded Elsewhere: Transitory disorders of carbohydrate metabolism specific to fetus or newborn (KB60)

5C51.0 **Disorders of the pentose phosphate pathway**

Coded Elsewhere: Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency (3A10.00)

5C51.1 **Disorders of glycerol metabolism**

5C51.2 **Disorders of glyoxylate metabolism**

Primary hyperoxaluria, or oxalosis, is a rare metabolic disorder transmitted as an autosomal recessive disease, including both type 1, the most frequent, and type 2, extremely rare. Hyperoxaluria type 1 is due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). Hyperoxaluria type 2 is extremely rare and is due to glycerate dehydrogenase deficiency.

5C51.20 Primary hyperoxaluria type 1

Primary hyperoxaluria type 1 is a rare metabolic disorder due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). The infantile form is characterised by chronic renal failure due to massive oxalate deposition. In other patients, urolithiasis develops with infections, haematuria, renal colic or acute renal failure due to complete obstruction. End-stage renal failure occurs before 15 years of age in half the cases and the resulting increase of circulating oxalate leads to its deposition in tissues causing cardiac conduction defects, hypertension, distal gangrene, and reduced joint mobility and pain.

5C51.2Y Other specified disorders of glyoxylate metabolism

5C51.2Z Disorders of glyoxylate metabolism, unspecified

5C51.3 **Glycogen storage disease**

The term Glycogen storage disease characterises a group of heterogeneous diseases resulting from defects in the process of glycogen synthesis or breakdown within muscles, liver, and other cell types.

5C51.4 **Disorders of galactose metabolism**

5C51.40 Galactose-1-phosphate uridyltransferase deficiency

Classic galactosemia is a life-threatening metabolic disease with onset in the neonatal period. Infants usually develop feeding difficulties, lethargy, and severe liver disease.

5C51.41 Galactokinase deficiency

Galactokinase deficiency is a rare mild form of galactosemia characterised by early onset of cataract and an absence of the usual signs of classic galactosemia, i.e. feeding difficulties, poor weight gain and growth, lethargy, and jaundice.

5C51.42 Glucose or galactose intolerance of newborn

5C51.4Y Other specified disorders of galactose metabolism

5C51.4Z Disorders of galactose metabolism, unspecified

5C51.5 **Disorders of fructose metabolism**

This refers to disorders of the metabolism of fructose in the phosphorylation of fructose to fructose 1-phosphate by fructokinase, thus trapping fructose for metabolism in the liver.

Coded Elsewhere: Fructose malabsorption (5C61.40)

5C51.50 Hereditary fructose intolerance

Hereditary fructose intolerance is an autosomal recessive disorder due to a deficiency of fructose-1-phosphate aldolase activity, which results in an accumulation of fructose-1-phosphate in the liver, kidney, and small intestine, and is characterised by severe abdominal pain, vomiting, and hypoglycaemia following ingestion of fructose or other sugars metabolised through fructose-1-phosphate.

Exclusions: Fructose malabsorption (5C61.40)

5C51.5Y Other specified disorders of fructose metabolism

5C51.5Z Disorders of fructose metabolism, unspecified

5C51.Y **Other specified inborn errors of carbohydrate metabolism**

5C51.Z **Inborn errors of carbohydrate metabolism, unspecified**

5C52 Inborn errors of lipid metabolism

Coded Elsewhere: Retinal dystrophy in lipid storage disorders (9B71.Y)

5C52.0 **Inborn errors of fatty acid oxidation or ketone body metabolism**

5C52.00 Disorders of carnitine transport or the carnitine cycle

5C52.01 Disorders of mitochondrial fatty acid oxidation

5C52.02 Disorders of ketone body metabolism

Coded Elsewhere: Cytosolic acetoacetyl-CoA thiolase deficiency (5C50.DY)

5C52.03 Sjögren-Larsson syndrome

Sjögren-Larsson syndrome is a neurocutaneous disorder caused by an inborn error of lipid metabolism and characterised by congenital ichthyosis, intellectual deficit, and spasticity.

5C52.0Y Other specified inborn errors of fatty acid oxidation or ketone body metabolism

5C52.0Z Inborn errors of fatty acid oxidation or ketone body metabolism, unspecified

5C52.1 **Inborn errors of sterol metabolism**

Coded Elsewhere: X-linked ichthyosis (EC20.01)

5C52.10 Disorders of cholesterol synthesis

Coded Elsewhere: Chondrodysplasia punctata, X-linked dominant (LD24.04)

Greenberg dysplasia (LD24.04)

Congenital hemidysplasia with ichthyosiform erythroderma and limbs defects (LD24.04)

Hyperalphalipoproteinaemia due to cholesteryl ester transfer protein deficiency (5C80.3)

5C52.11 Bile acid synthesis defect with cholestasis

Anomalies of bile acid synthesis are a group of sterol metabolism disorders due to enzyme deficiencies of bile acid synthesis in infants, children and adults, with variable manifestations that include cholestasis, neurological disease, and fat malabsorption. Eight inborn errors have been clearly identified, 7 of which lead to liver cholestasis and include: 3-beta-hydroxy-C27-steroid oxidoreductase deficiency (type 1), delta4-3-oxosteriod-5-beta reductase deficiency (type 2), oxysterol 7alpha-hydroxylase deficiency (type 3), 2-methylacyl-CoA racemase deficiency (type 4), bile acid CoA ligase deficiency, and cerebrotendinous xanthomatosis. Cholesterol 7alpha-hydroxylase deficiency leads to hypercholesterolaemia without liver cholestasis.

5C52.1Y Other specified inborn errors of sterol metabolism

5C52.1Z Inborn errors of sterol metabolism, unspecified

5C52.2 Neutral lipid storage disease

Neutral lipid storage disease (NLSD) refers to a group of diseases characterised by a deficit in the degradation of cytoplasmic triglycerides and their accumulation in cytoplasmic lipid vacuoles in most tissues of the body. The group is heterogeneous: NLSD with icthyosis (NLSDI/Dorfman-Chanarin disease) and NLSD with myopathy (NLSDM/neutral lipid storage myopathy) can be distinguished.

5C52.Y Other specified inborn errors of lipid metabolism

5C52.Z Inborn errors of lipid metabolism, unspecified

5C53 Inborn errors of energy metabolism

5C53.0 Disorders of pyruvate metabolism

5C53.00 Pyruvate kinase deficiency

This refers an enzyme involved in glycolysis. It catalyzes the transfer of a phosphate group from phosphoenolpyruvate (PEP) to ADP, yielding one molecule of pyruvate and one molecule of ATP.

Coded Elsewhere: Glycogen storage disease due to muscle pyruvate kinase deficiency (5C51.3)

Haemolytic anaemia due to red cell pyruvate kinase deficiency (3A10.Y)

5C53.01 Lactate dehydrogenase deficiency

This refers to a deficiency in the enzyme present in a wide variety of organisms, including plants and animals. This exist in four distinct enzyme classes. Two of them are cytochrome c-dependent enzymes, each acting on either D-lactate (EC 1.1.2.4) or L-lactate (EC 1.1.2.3). The other two are NAD(P)-dependent enzymes, each acting on either D-lactate (EC 1.1.1.28) or L-lactate (EC 1.1.1.27). This article is about the NAD(P)-dependent L-lactate dehydrogenase.

5C53.02 Pyruvate dehydrogenase complex deficiency

Pyruvate dehydrogenase deficiency (PDHD) is a rare neurometabolic disorder characterised by a wide range of clinical signs with metabolic and neurological components of varying severity. Manifestations range from often fatal, severe, neonatal to later-onset neurological disorders.

5C53.03 Pyruvate carboxylase deficiency

This is a deficiency in the enzyme of the ligase class that catalyzes the (depending on the species) irreversible carboxylation of pyruvate to form oxaloacetate (OAA).

5C53.0Y Other specified disorders of pyruvate metabolism

5C53.0Z Disorders of pyruvate metabolism, unspecified

5C53.1 Disorders of the citric acid cycle

5C53.2 Disorders of mitochondrial oxidative phosphorylation

An inborn error of metabolism in cellular respiration (oxidative phosphorylation) in the mitochondria, where a series of enzymes catalyze the transfer of electrons to molecular oxygen and the generation of energy-storing ATP

Coded Elsewhere: Neuropathy, ataxia, and retinitis pigmentosa (8C73.1)

5C53.20 Mitochondrial DNA depletion syndromes

The mitochondrial DNA (mtDNA) depletion syndrome (MDS) is a clinically heterogeneous group of mitochondrial disorders characterised by a reduction of the mtDNA copy number in affected tissues without mutations or rearrangements in the mtDNA. MDS is phenotypically heterogeneous, manifesting either as a hepatocerebral form, a myopathic form, a benign 'later-onset' myopathic form or a cardiomyopathic form.

Coded Elsewhere: Childhood-onset autosomal dominant optic atrophy (9C40.8)

5C53.21 Multiple mitochondrial DNA deletion syndromes

This is the multiple DNA located in organelles called mitochondria, structures within eukaryotic cells that convert the chemical energy from food into a form that cells can use, adenosine triphosphate (ATP).

Coded Elsewhere: Progressive external ophthalmoplegia, autosomal dominant (9C82.0)

Progressive external ophthalmoplegia, autosomal recessive (9C82.0)

Autosomal dominant optic atrophy plus syndrome (9C40.8)

Deafness - optic atrophy syndrome (LD2H.Y)

Autosomal dominant optic atrophy and cataract (9C40.8)

5C53.22 Coenzyme Q10 deficiency

This is a deficiency in a 1,4-benzoquinone, where Q refers to the quinone chemical group, and 10 refers to the number of isoprenyl chemical subunits in its tail. This oil-soluble, vitamin-like substance is present in most eukaryotic cells, primarily in the mitochondria. It is a component of the electron transport chain and participates in aerobic cellular respiration, generating energy in the form of ATP.

Coded Elsewhere: Cerebellar atrophy - ataxia - seizures (LD90.Y)

5C53.23 Mitochondrial protein translation defects

This refers to defects in the enzyme that belongs to the family of hydrolases, specifically those acting on acid anhydrides to catalyse transmembrane movement of substances.

Coded Elsewhere: Pontocerebellar hypoplasia type 6 (LD20.01)

Mitochondrial myopathy with sideroblastic anaemia (3A72.0Y)

5C53.24 Leigh syndrome

Leigh syndrome or subacute necrotizing encephalomyelopathy is a progressive neurological disease defined by specific neuropathological features associating brainstem and basal ganglia lesions. Loss of motor milestones, hypotonia with poor head control, recurrent vomiting, and a movement disorder are common initial symptoms. Pyramidal and extrapyramidal signs, nystagmus, breathing disorders, ophthalmoplegia and peripheral neuropathy are often noted later. Epilepsy is relatively uncommon. Leigh syndrome has multiple causes, all of which imply a defect in aerobic energy production, ranging from the pyruvate dehydrogenase complex to the oxidative phosphorylation pathway.

Coded Elsewhere: Maternally inherited Leigh syndrome (8C73.Y)

5C53.25 Isolated ATP synthase deficiency

5C53.2Y Other specified disorders of mitochondrial oxidative phosphorylation

5C53.2Z Disorders of mitochondrial oxidative phosphorylation, unspecified

5C53.3 **Disorders of mitochondrial membrane transport**

An inborn error of metabolism in proteins in the membranes of mitochondria, which serve to transport molecules and other factors such as ions into or out of the organelles

5C53.30 Mitochondrial substrate carrier disorders

Coded Elsewhere: Autosomal recessive sideroblastic anaemia, pyridoxine-refractory (3A72.00)

5C53.31 Mitochondrial protein import disorders

This refers to disorders in the enzyme belongs to the family of hydrolases, specifically those acting on acid anhydrides to catalyse transmembrane movement of substances.

Coded Elsewhere: Deafness-dystonia optic atrophy syndrome (8A02.12)

5C53.3Y Other specified disorders of mitochondrial membrane transport

5C53.3Z Disorders of mitochondrial membrane transport, unspecified

5C53.4 **Disorders of creatine metabolism**

An inborn error of metabolism in creatine which serves as an energy shuttle between the mitochondrial sites of ATP production and the cytosol where ATP is utilized

5C53.Y **Other specified inborn errors of energy metabolism**

5C53.Z **Inborn errors of energy metabolism, unspecified**

5C54 Inborn errors of glycosylation or other specified protein modification

Congenital Disorders of Glycosylation (CDG) syndromes are a group of glycoprotein synthesis disorders characterised by neurological manifestations that can be associated with multivisceral involvement. The CDG syndromes are associated with different enzymatic deficits.

5C54.0 **Disorders of protein N-glycosylation**

Congenital disorders involving defective N-glycosylation of proteins (the addition of glycans linked to the polypeptide chain by a beta-linkage between the anomeric carbon of N-acetylglucosamine and the amido group of L-asparagine).

5C54.1 **Disorders of protein O-glycosylation**

Congenital disorders involving defective O-linked glycosylation, which typically occurs via an alpha linkage of the glycan to the hydroxyl group of a serine or threonine residue on a protein

Coded Elsewhere: Multiple osteochondromas (LD24.20)

5C54.2 **Disorders of multiple glycosylation or other pathways**

Coded Elsewhere: Hereditary inclusion body myositis (4A41.20)

5C54.Y **Other specified congenital disorders of glycosylation and protein modification**

5C54.Z **Congenital disorders of glycosylation and protein modification, unspecified**

5C55 Inborn errors of purine, pyrimidine or nucleotide metabolism

Exclusions: Xeroderma pigmentosum (LD27.1)

Calculus of kidney (GB70.0)

5C55.0 **Disorders of purine metabolism**

Coded Elsewhere: Primary gout (FA25.0)

Haemolytic anaemia due to adenosine deaminase excess (3A10.1)

Immunodeficiency due to purine nucleoside phosphorylase deficiency (4A01.1Y)

Severe combined immunodeficiency T- B- due to adenosine deaminase deficiency (4A01.10)

5C55.00 Xanthinuria

5C55.01 Lesch-Nyhan syndrome

Lesch-Nyhan syndrome (LNS) is the most severe form of hypoxanthine-guanine phosphoribosyltransferase (HPRT) deficiency, a hereditary disorder of purine metabolism, and is associated with uric acid overproduction (UAO), neurological troubles, and behavioural problems. Patients are normal at birth. Psychomotor delay becomes evident within 3 to 6 months with a delay in head support and sitting, hypotonia and athetoid movements. Sandy urine in diapers or crystalluria with urinary tract obstruction are common forms of presentation. Patients usually show mild to moderate intellectual deficit. Diagnosis is suspected when psychomotor delay occurs in a patient with elevated UA in blood and urine. Undetectable HPRT enzyme activity in peripheral blood or in intact cells (erythrocyte, fibroblast) and molecular genetic testing confirm the diagnosis. Inheritance is X-linked recessive.

5C55.0Y Other specified disorders of purine metabolism

5C55.0Z Disorders of purine metabolism, unspecified

5C55.1 **Disorders of pyrimidine metabolism**

Coded Elsewhere: Hereditary orotic aciduria (3A03.0)

Haemolytic anaemia due to pyrimidine 5' nucleotidase deficiency (3A10.Y)

5C55.2 **Disorders of nucleotide metabolism**

Coded Elsewhere: Haemolytic anaemia due to adenosine triphosphatase deficiency (3A10.Y)

5C55.Y **Other specified inborn errors of purine, pyrimidine or nucleotide metabolism**

5C55.Z **Inborn errors of purine, pyrimidine or nucleotide metabolism, unspecified**

5C56 Lysosomal diseases

Exclusions: Glycogen storage disease due to LAMP-2 deficiency (5C51.3)

5C56.0 **Sphingolipidosis**

Coded Elsewhere: Krabbe disease (8A44.4)

5C56.00 Gangliosidosis

5C56.01 Fabry disease

Fabry disease (FD) is a progressive, inherited, multisystemic lysosomal storage disease characterised by specific neurological, cutaneous, renal, cardiovascular, cochleo-vestibular and cerebrovascular manifestations.

Coded Elsewhere: Glomerular disease associated with Fabry disease (GB4Z)

5C56.02 Metachromatic leukodystrophy

Metachromatic leukodystrophy is a neurodegenerative disease characterised by an accumulation of sulfatides (sulphated glycosphingolipids, especially sulfogalactosylceramides or sulfogalactocerebrosides) in the nervous system and kidneys. Three forms of the disease exist: late infantile, juvenile and adult.

5C56.0Y Other specified sphingolipidosis

5C56.0Z Sphingolipidosis, unspecified

5C56.1 **Neuronal ceroid lipofuscinosis**

Neuronal ceroid lipofuscinoses (NCLs) are a group of inherited progressive degenerative brain diseases characterised clinically by a decline of mental and other capacities, epilepsy, and vision loss through retinal degeneration, and histopathologically by intracellular accumulation of an autofluorescent material, ceroid lipofuscin, in the neuronal cells in the brain and in the retina.

5C56.2 **Glycoproteinosis**

These are lysosomal storage diseases affecting glycoproteins, resulting from defects in lysosomal function. The term is sometimes reserved for conditions involving degradation of glycoproteins.

5C56.20 Mucolipidosis

Exclusions: Sialidosis (mucolipidosis type 1) (5C56.21)

Coded Elsewhere: Mucolipidosis type 4 (5C56.0Y)

Wolman disease (5C56.0Y)

5C56.21 Oligosaccharidosis

5C56.2Y Other specified glycoproteinosis

5C56.2Z Glycoproteinosis, unspecified

5C56.3 **Mucopolysaccharidosis**

Inclusions: Disorders of glycosaminoglycan metabolism

5C56.30 Mucopolysaccharidosis type 1

Mucopolysaccharidosis type 1 (MPS 1) is a rare lysosomal storage disease belonging to the group of mucopolysaccharidoses. There are three variants, differing widely in their severity, with Hurler syndrome (57% of cases) being the most severe, Scheie syndrome (20% of cases) the mildest and Hurler-Scheie syndrome (23% of cases) giving an intermediate phenotype.

5C56.31 Mucopolysaccharidosis type 2

Mucopolysaccharidosis type 2 (MPS 2) is a lysosomal storage disease belonging to the group of mucopolysaccharidoses. The clinical picture ranges from severe (the most frequent form) with early psychomotor regression, facial dysmorphism (macroglossia, constantly opened mouth, coarse features), hepatosplenomegaly, limited joint motion, carpal tunnel syndrome, dysostosis multiplex, small size, behavioural disorders and psychomotor regression leading to intellectual deficit, deafness, cardiac and respiratory disorders, and cutaneous signs, to mild (normal intelligence, milder dysmorphism and dysostoses).

Inclusions: Hunter syndrome

5C56.32 Mucopolysaccharidosis type 4

Mucopolysaccharidosis type IV (MPS IV) is a lysosomal storage disease belonging to the group of mucopolysaccharidoses, and characterised by spondylo-epiphyso-metaphyseal dysplasia. It exists in two clinically indistinguishable forms, A and B. A deficiency in one of the two enzymes required for the degradation of keratan sulfate (KS) is responsible for the MPS IV subtypes: N-acetylgalactosamine-6-sulfate sulfatase in MPS IVA, and beta-D-galactosidase in MPS IVB.

5C56.33 Mucopolysaccharidosis type 6

Mucopolysaccharidosis type 6 (MPS VI) is a lysosomal storage disease with progressive multisystem involvement, associated with a deficiency of arylsulfatase B (ASB) leading to the accumulation of dermatan sulfate. The disorder shows a wide spectrum of symptoms from slowly to rapidly progressing forms.

5C56.3Y Other specified mucopolysaccharidosis

5C56.3Z Mucopolysaccharidosis, unspecified

5C56.4 Disorders of sialic acid metabolism

This refers to any disorders of the N- or O-substituted derivatives of neuraminic acid, a monosaccharide with a nine-carbon backbone.

5C56.Y Other specified lysosomal diseases

5C56.Z Lysosomal diseases, unspecified

5C57 Peroxisomal diseases

Peroxisomal disorders represent a class of medical conditions caused by defects in peroxisome functions. This may be due to defects in single enzymes important for peroxisome function or in peroxins, proteins encoded by PEX genes that are critical for normal peroxisome assembly and biogenesis.

Coded Elsewhere: Primary hyperoxaluria type 1 (5C51.20)

Adrenoleukodystrophy (8A44.1)

Rhizomelic chondrodysplasia punctata (LD24.04)

Glutaric aciduria type 3 (5C50.E0)

5C57.0 Disorders of peroxisome biogenesis

Peroxisome biogenesis disorders (PBDs) include the Zellweger syndrome spectrum (PBD-ZSD) and rhizomelic chondrodysplasia punctata type 1 (RCDP1). PBD-ZSD represents a continuum of disorders including infantile Refsum disease, neonatal adrenoleukodystrophy, and Zellweger syndrome. Collectively, PBDs are autosomal recessive developmental brain disorders that also result in skeletal and craniofacial dysmorphism, liver dysfunction, progressive sensorineural hearing loss, and retinopathy.

5C57.1 Disorders of peroxisomal alpha-, beta- or omega-oxidation

Coded Elsewhere: Congenital bile acid synthesis defect type 4 (5C52.11)

5C57.Y Other specified peroxisomal diseases

5C57.Z Peroxisomal diseases, unspecified

5C58 Inborn errors of porphyrin or heme metabolism

Inclusions: defects of catalase and peroxidase

Coded Elsewhere: X-linked sideroblastic anaemia, pyridoxine-responsive (3A72.00)

5C58.0 Disorders of bilirubin metabolism or excretion

Coded Elsewhere: Neonatal hyperbilirubinaemia (KA87)

5C58.00 Crigler-Najjar syndrome

Crigler-Najjar syndrome is an autosomal recessive disorder of bilirubin metabolism characterised by unconjugated hyperbilirubinemia due to a hepatic deficit of bilirubin glucuronosyltransferase activity. Two types have been described, CNS types 1 and 2, depending on whether the enzymatic deficit is complete or partial: clinical manifestations vary accordingly. Patients present with isolated jaundice that appears early in life. Biological analyses detect severe unconjugated hyperbilirubinemia with normal liver function tests. Abdominal imaging studies (plain X-rays, CT scans or ultrasonograms) and liver histology findings are normal. Diagnosis is generally confirmed by genomic DNA analysis.

5C58.01 Gilbert syndrome

Gilbert's syndrome is an inherited liver disorder characterised by jaundice due to unconjugated hyperbilirubinemia, resulting from a partial deficiency in hepatic bilirubin glucuronosyltransferase activity.

5C58.02 Dubin-Johnson syndrome

Dubin-Johnson syndrome (DJS) is a benign, inherited liver disorder characterised clinically by chronic, predominantly conjugated, hyperbilirubinemia and histopathologically by black-brown pigment deposition in parenchymal liver cells.

5C58.03 Progressive familial intrahepatic cholestasis

Progressive familial intrahepatic cholestasis (PFIC) refers to a heterogeneous group of autosomal recessive disorders of childhood that disrupt bile formation and present with cholestasis of hepatocellular origin. Three types of PFIC have been identified and are related to mutations in hepatocellular transport system genes involved in bile formation. PFIC1 and PFIC2 usually appear in the first months of life, whereas onset of PFIC3 may also occur later in infancy, in childhood or even during young adulthood.

5C58.04 Benign recurrent intrahepatic cholestasis

5C58.0Y Other specified disorders of bilirubin metabolism or excretion

5C58.0Z Disorders of bilirubin metabolism or excretion, unspecified

5C58.1 **Porphyrias**

Porphyrias constitute a group of diseases characterised by intermittent neuro-visceral manifestations, cutaneous lesions or by the combination of both. All porphyrias are caused by a deficiency in one of the enzymes of the heme biosynthesis pathway resulting in an accumulation of porphyrins and/or their precursors in the liver or bone marrow. Clinical signs of the disease usually appear in adulthood, but some porphyrias affect children. Porphyrias can be classified according to the main location of the metabolic anomaly. Direct or indirect neurotoxicity may cause neurological manifestations. Transmission of hereditary porphyrias is autosomal and either dominant with weak penetrance or recessive with complete penetrance. Diagnosis is mainly based on the measurement of porphyrins and their precursors in biological samples.

Coded Elsewhere: Liver diseases due to porphyria (5C90.1)

5C58.10 Porphyria cutanea tarda

Porphyria cutanea tarda (PCT) is due to an accumulation of uroporphyrins in plasma from blockage of the normal haem synthetic pathway in the liver at the level of uroporphyrinogen decarboxylase (URO-D). The majority of cases are sporadic and frequently associated with iron overload. PCT manifests as skin fragility and blistering in light-exposed skin, particularly on the dorsa of the hands, together with hypertrichosis.

5C58.12 Erythropoietic porphyrias

Erythropoietic porphyrias are associated clinically with photosensitivity and biochemically with abnormal accumulation of porphyrins in erythrocytes. They include erythropoietic protoporphyria and the very rare congenital erythropoietic porphyria.

5C58.13 Variegate porphyria

Variegate porphyria is a form of acute hepatic porphyria characterised by the occurrence of neuro-visceral attacks with or without the presence of cutaneous lesions (bullous photodermatitis).

5C58.1Y Other specified porphyrias

5C58.1Z Porphyrias, unspecified

5C58.Y **Other specified inborn errors of porphyrin or heme metabolism**

5C58.Z **Inborn errors of porphyrin or heme metabolism, unspecified**

5C59 Inborn errors of neurotransmitter metabolism

5C59.0 **Disorders of biogenic amine metabolism**

5C59.00 Disorders of catecholamine synthesis

Any condition caused by failure to correctly synthesize catecholamines. Confirmation is by blood test.

5C59.01 Disorders of pterin metabolism

Any condition caused by failure to correctly metabolize pterin.

Coded Elsewhere: Dopa-responsive dystonia (8A02.11)

5C59.0Y Other specified disorders of biogenic amine metabolism

5C59.0Z Disorders of biogenic amine metabolism, unspecified

5C59.1 **Disorders of gamma aminobutyric acid metabolism**

Coded Elsewhere: 4-hydroxybutyric aciduria (5C50.E1)

5C59.2 **Disorders of pyridoxine metabolism**

Coded Elsewhere: Pyridoxal dependent epilepsy (8A61.00)

Pyridoxine dependent epilepsy with antiquitin mutations (8A61.0Y)

5C59.Y **Other specified inborn errors of neurotransmitter metabolism**

5C59.Z **Inborn errors of neurotransmitter metabolism, unspecified**

5C5A **Alpha-1-antitrypsin deficiency**

Alpha-1-antitrypsin deficiency (AATD) is a genetic disorder that manifests as pulmonary emphysema, liver cirrhosis and, rarely, as the skin disease panniculitis, and is characterised by low serum levels of AAT, the main protease inhibitor (PI) in human serum.

5C5Y **Other specified inborn errors of metabolism**

5C5Z **Inborn errors of metabolism, unspecified**

Disorders of metabolite absorption or transport (5C60-5C6Z)

5C60 **Disorders of amino acid absorption or transport**

Any condition caused by deficiencies in amino acid absorption and transport.

Exclusions: Disorders of tryptophan metabolism (5C50.3)

Coded Elsewhere: Fanconi syndrome (GB90.42)

5C60.0 **Oculocerebrorenal syndrome**

Oculocerebrorenal syndrome of Lowe (OCRL) is a multisystem disorder characterised by congenital cataracts, glaucoma, intellectual disabilities, postnatal growth retardation and renal tubular dysfunction with chronic renal failure.

5C60.1 **Cystinosis**

Cystinosis is a metabolic disease characterised by an accumulation of cystine inside the lysosomes of different tissues due to a defect in cystine transport out of lysosomes. There are three clinical forms : infantile, juvenile and ocular. The infantile form is severe, multisystem disease, with impaired proximal tubular reabsorptive capacity, with severe fluid-electrolyte balance alterations, cystine deposits in various organs and progression towards renal failure after 6 years of age. Juvenile cystinosis appear around 8 years of age and has an intermediate clinical picture with end-stage renal disease occurring after the age of 15.The ocular, adult form presents with photophobia.

5C60.2 **Cystinuria**

Cystinuria is a renal tubular aminoacid transport disorder characterised by recurrent formation of kidneys cystine stones.

5C60.Y **Other specified disorders of amino acid absorption or transport**

5C60.Z **Disorders of amino acid absorption or transport, unspecified**

5C61 Disorders of carbohydrate absorption or transport

5C61.0 **Glucose-galactose malabsorption**

Glucose-galactose malabsorption is characterised by diarrhoea and severe neonatal dehydration. Around 300 cases have been described to date. Moderate glucosuria has also been reported, but fructose absorption is normal. Glucose-galactose malabsorption is caused by a mutation in the SLC5A1 gene, encoding the glucose-sodium cotransporter, SGTL1. The mode of transmission is autosomal recessive. The fatal consequences of this syndrome can be avoided by following a glucose and galactose restricted diet.

Exclusions: Glucose or galactose intolerance of newborn (5C51.42)

5C61.1 **Maltase-glucoamylase deficiency**

Chronic diarrhea due to glucoamylase deficiency is characterised by chronic diarrhoea in infancy or childhood in association with intestinal glucoamylase deficiency.

5C61.2 **Congenital sucrase-isomaltase deficiency**

Congenital sucrase-isomaltase deficiency (CSID) is a carbohydrate intolerance disorder characterised by malabsorption of oligosaccharides and disaccharides. CSID is transmitted as an autosomal recessive trait and is caused by mutations in the brush-border membrane complex sucrase-isomaltase (SI), which is required for the breakdown of sucrose and starch into monosaccharides. The SI deficiency results in an accumulation of disaccharides in the lumen, causing osmotic diarrhoea. The prognosis for patients is good as the starch intolerance usually resolves during the first few years of life and sucrose intolerance usually improves with age.

5C61.3 **Alpha, alpha trehalase deficiency**

Alpha, alpha trehalase deficiency is characterised by diarrhoea and vomiting after ingestion of trehalose, a disaccharide found mainly in mushrooms. The disease is very rare in most populations but the incidence has been estimated at least 1 in 13 in Greenland. Isolated trehalose intolerance is due to a deficiency of trehalase (TREH; 11q23.3), a brush-border membrane glycoprotein.

5C61.4 **Acquired monosaccharide malabsorption**

This is an acquired condition in which the cells lining the intestine cannot take in one or all of the sugars glucose, galactose or fructose, which prevents proper digestion of these molecules and larger molecules made from them.

It may cause osmotic diarrhoea.

5C61.40 Fructose malabsorption

5C61.4Y Other specified acquired monosaccharide malabsorption

5C61.4Z Acquired monosaccharide malabsorption, unspecified

5C61.5 Disorders of facilitated glucose transport

Coded Elsewhere: Glycogen storage disease due to GLUT2 deficiency (5C51.3)

5C61.6 Lactose intolerance

Lactose intolerance is the inability to digest lactose, a sugar found in milk and some dairy products, due to a deficiency of lactase, the enzyme that metabolizes lactose. Lactose intolerance occurs when lactose is not completely broken down and consequently the sugar cannot be absorbed into the blood.

5C61.60 Primary lactase deficiency

5C61.61 Congenital lactase deficiency

This is a congenital deficiency of lactase (EC 3.2.1.108), inherited as an autosomal recessive trait, presenting in infancy and manifested by profuse watery diarrhoea in response to dietary milk, due to inability to digest lactose, a sugar found in milk and to a lesser extent milk-derived dairy products. The condition may lead to marasmus and death if lactose is not eliminated from the diet.

5C61.62 Secondary lactase deficiency

This form of lactase deficiency results from some sort of damage to the intestines either due to a disease or surgery.

Coding Note: Code also the causing condition

5C61.6Z Lactose intolerance, unspecified

5C61.Y Other specified disorders of carbohydrate absorption or transport

5C61.Z Disorders of carbohydrate absorption or transport, unspecified

5C62 Disorders of lipid absorption or transport

5C63 Disorders of vitamin or non-protein cofactor absorption or transport

Coded Elsewhere: Hereditary factor X deficiency (3B14.1)

Combined deficiency of vitamin K-dependent clotting factors (3B14.2)

5C63.0 Disorders of cobalamin metabolism or transport

Coded Elsewhere: Hereditary Vitamin B12 deficiency anaemia (3A01.0)

Neonatal vitamin B12 deficiency anaemia (3A01.1)

Methylmalonic aciduria, vitamin B12 responsive (5C50.E0)

Congenital or neonatal vitamin B12 deficiency anaemia (3A01.Y)

5C63.1 Disorders of folate metabolism or transport

Coded Elsewhere: Formiminoglutamic aciduria (3A02.Y)

5C63.2 Disorders of vitamin D metabolism or transport

5C63.20 Hypocalcaemic vitamin D dependent rickets

Hypocalcaemic vitamin D-dependent rickets (VDDR-I) is an early-onset hereditary vitamin D metabolism disorder characterised by severe hypocalcaemia leading to osteomalacia and rachitic bone deformations, and moderate hypophosphatemia.

5C63.21 Hypocalcaemic vitamin D resistant rickets

Hypocalcaemic vitamin D-resistant rickets is a hereditary disorder of vitamin D action characterised by hypocalcaemia, severe rickets and in many cases alopecia.

5C63.22 Hypophosphataemic rickets

Hypophosphatemic rickets is a group of genetic diseases characterised by hypophosphatemia, rickets, and normal serum levels of calcium.

5C63.2Y Other specified disorders of vitamin D metabolism or transport

5C63.2Z Disorders of vitamin D metabolism or transport, unspecified

5C63.Y Other specified disorders of vitamin or non-protein cofactor absorption or transport

5C63.Z Disorders of vitamin or non-protein cofactor absorption or transport, unspecified

5C64 Disorders of mineral absorption or transport

A condition in which there is a deviation or interruption in the processing of a specific mineral in the body: its absorption, transport, storage, and utilization

Exclusions: Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z)

Vitamin D deficiency (5B57)

dietary mineral deficiency (5B5K)

5C64.0 Disorders of copper metabolism

Any condition caused by failure to correctly metabolize copper.

Coded Elsewhere: X-linked cutis laxa (LD28.2)

5C64.00 Wilson disease

Wilson disease is an autosomal recessive disorder of copper metabolism characterised by the toxic accumulation of copper, mainly in the liver and central nervous system that may present as hepatic, neurologic or psychiatric forms.

5C64.0Y Other specified disorders of copper metabolism

5C64.0Z Disorders of copper metabolism, unspecified

5C64.1 Disorders of iron metabolism

This refers to any disorders of the set of chemical reactions maintaining human homeostasis of iron. The control of this necessary but potentially toxic substance is an important part of many aspects of human health and disease.

Exclusions: Sideroblastic anaemia (3A72)

Iron deficiency anaemia (3A00)

5C64.10 Iron overload diseases

Iron overload is the accumulation of excess iron in body tissues. Iron overload usually occurs as a result of a genetic predisposition to absorb and store iron in excess amounts, the most common form of which is hereditary hemochromatosis. Iron overload can also occur as a complication of other hematologic disorders that require chronic transfusion therapy, repeated injections of parenteral iron, or excessive iron ingestion. Excessive iron stores usually accumulate in the reticuloendothelial tissues and cause little damage ("hemosiderosis"). If overload continues, iron eventually begins to accumulate in tissues such as hepatic parenchyma, pancreas, heart and synovium, causing hemochromatosis.

Coded Elsewhere: Friedreich ataxia (8A03.10)

Atransferrinaemia (3A00.Y)

Microcytic anaemia with liver iron overload (3A00.Y)

5C64.1Y Other specified disorders of iron metabolism

5C64.1Z Disorders of iron metabolism, unspecified

5C64.2 Disorders of zinc metabolism

Any condition caused by failure to correctly metabolize zinc. These conditions may present with dermatitis, diarrhoea, alopecia, loss of appetite, growth impairment, neuropsychological changes, or immune deficiency syndromes.

5C64.20 Acrodermatitis enteropathica

Acrodermatitis enteropathica is an uncommon autosomal recessive disorder of intestinal zinc absorption. Signs usually appear within the first months of life with an exudative and crusted erythema located predominantly around body orifices (mouth, anogenital) and on the scalp and distal extremities. The signs are often misdiagnosed as being due to infection. The condition responds rapidly to zinc supplementation which must be continued throughout life.

5C64.21 Zinc deficiency syndromes

Coded Elsewhere: Acrodermatitis enteropathica (5C64.20)

5C64.2Y Other specified disorders of zinc metabolism

5C64.2Z Disorders of zinc metabolism, unspecified

5C64.3 Disorders of phosphorus metabolism or phosphatases

Any condition caused by errors in phosphorus metabolism, or in phosphatase activity.

Exclusions: Adult osteomalacia (FB83.2)

Osteoporosis (FB83.1)

Coded Elsewhere: Hypophosphataemic rickets (5C63.22)

Phosphate losing hypophosphataemia (GB90.48)

5C64.4 **Disorders of magnesium metabolism**

Any condition caused by failure to correctly metabolize magnesium.

Coded Elsewhere: Transitory neonatal disorders of calcium or magnesium metabolism (KB61)

5C64.40 Hypermagnesaemia

This is an electrolyte disturbance in which there is an abnormally elevated level of magnesium in the blood. Usually this results in excess of magnesium in the body.

5C64.41 Hypomagnesaemia

This is an electrolyte disturbance in which there is an abnormally low level of magnesium in the blood. Normal magnesium levels in humans fall between 1.5 - 2.5 mg/dL. Usually a serum level less than 0.7 mmol/L is used as reference for hypomagnesemia (not hypomagnesia which refers to low magnesium content in food/supplement sources).

Coded Elsewhere: Neonatal hypomagnesaemia (KB61.0)

5C64.4Z Disorders of magnesium metabolism, unspecified

5C64.5 **Disorders of calcium metabolism**

This refers to and disorders in the mechanism by which the body maintains adequate calcium levels. Derangements of this mechanism lead to hypercalcaemia or hypocalcaemia, both of which can have important consequences for health.

Exclusions: Hyperparathyroidism (5A51)

Chondrocalcinosis (FA26.2)

Coded Elsewhere: Familial hypocalciuric hypercalcaemia (5A51.2)

Hypercalciuria (MF98.0)

Nephrocalcinosis (GB57)

Hypercalcaemia (5B91.0)

Transitory neonatal disorders of calcium or magnesium metabolism (KB61)

5C64.6 **Disorders of sodium metabolism**

Coded Elsewhere: Tubular disorders of sodium or potassium transport (GB90.46)

Congenital sodium diarrhoea (DA90.1)

5C64.7 **Disorders of chloride metabolism**

Coded Elsewhere: Congenital chloride diarrhoea (DA90.1)

5C64.Y **Disorders of other specified mineral absorption and transport**

5C64.Z **Disorders of mineral absorption or transport, unspecified**

5C6Y **Other specified disorders of metabolite absorption or transport**

5C6Z **Disorders of metabolite absorption or transport, unspecified**

5C70 Volume depletion

Exclusions: Hypovolaemic shock (MG40.1)

5C70.0 Dehydration

Dehydration occurs when there is an insufficient amount or excessive loss of water in the body. This can be caused by vomiting, diarrhoea, fever, use of diuretics, profuse sweating, or decreased water intake.

Coded Elsewhere: Dehydration of newborn (KB63.1)

5C70.1 Hypovolaemia

This is a state of decreased blood volume; more specifically, decrease in volume of blood plasma. It is thus the intravascular component of volume contraction (or loss of blood volume due to things such as haemorrhaging or dehydration), but, as it also is the most essential one, hypovolemia and volume contraction are sometimes used synonymously.

Exclusions: Traumatic shock, not elsewhere classified (NF0A.4)

Hypovolaemic shock (MG40.1)

5C70.Y Other specified volume depletion

5C70.Z Volume depletion, unspecified

5C71 Hyperosmolality or hypernatraemia

Serum sodium concentrations in excess of 145 mmol/L; increased serum concentration of osmotically active particles

Coded Elsewhere: Hypernatremia of newborn (KB63.21)

5C72 Hypo-osmolality or hyponatraemia

Serum sodium concentrations of less than 135 mEq/L; decreased serum concentration of osmotically active particles

Inclusions: sodium [na] deficiency

Exclusions: Syndrome of inappropriate secretion of antidiuretic hormone (5A60.2)

Coded Elsewhere: Hyponatremia of newborn (KB63.20)

5C73 Acidosis

Acidosis is an abnormally acidic state of the blood and tissues.

Exclusions: diabetic acidosis (5A10-5A2Y)

Coded Elsewhere: Late metabolic acidosis of newborn (KB63.0)

Kussmaul respiration (5A22.Y)

5C73.0 **Acute respiratory acidosis**

This is an acute condition in which decreased ventilation (hypoventilation) causes increased blood carbon dioxide concentration and decreased pH (a condition generally called acidosis). Carbon dioxide is produced continuously as the body's cells respire, and this CO2 will accumulate rapidly if the lungs do not adequately expel it through alveolar ventilation. Alveolar hypoventilation thus leads to an increased PaCO2 (called hypercapnia). The increase in PaCO2 in turn decreases the HCO3-/PaCO2 ratio and decreases pH.

5C73.1 **Chronic respiratory acidosis**

This is a chronic condition in which decreased ventilation (hypoventilation) causes increased blood carbon dioxide concentration and decreased pH (a condition generally called acidosis). Carbon dioxide is produced continuously as the body's cells respire, and this CO2 will accumulate rapidly if the lungs do not adequately expel it through alveolar ventilation. Alveolar hypoventilation thus leads to an increased PaCO2 (called hypercapnia). The increase in PaCO2 in turn decreases the HCO3?/PaCO2 ratio and decreases pH.

5C73.2 **Anion gap metabolic acidosis**

This is a form of metabolic acidosis characterised by a high anion gap. The list of agents that cause high anion gap metabolic acidosis is similar to but broader than the list of agents that cause a serum osmolal gap.

5C73.Y **Other specified acidosis**

5C73.Z **Acidosis, unspecified**

5C74 Alkalosis

Alkalosis is an abnormally basic state of the blood and tissues.

5C75 Mixed disorder of acid-base balance

This is a condition where more than one of the normal mechanisms that regulate the amount of acid or base content in the body are dysfunctional.

5C76 Hyperkalaemia

Inclusions: Potassium [K] excess

Potassium [K] overload

Coded Elsewhere: Hyperkalaemia of newborn (KB63.31)

5C77 Hypokalaemia

Coded Elsewhere: Hypokalaemia of newborn (KB63.30)

5C78 **Fluid overload**

This is the condition where there is too much fluid in the blood. The opposite condition is hypovolemia, which is too little fluid volume in the blood. Fluid volume excess in the intravascular compartment occurs due to an increase in total body sodium content and a consequent increase in extracellular body water. The mechanism usually stems from compromised regulatory mechanisms for sodium handling as seen in congestive heart failure (CHF), kidney failure, and liver failure. It may also be caused by excessive intake of sodium from foods, intravenous (IV) solutions and blood transfusions, medications, or diagnostic contrast dyes.

5C7Y **Other specified disorders of fluid, electrolyte or acid-base balance**

5C7Z **Disorders of fluid, electrolyte or acid-base balance, unspecified**

Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z)

Elevated levels of lipoprotein(a), or Lp(a), in the blood. It is associated with an elevated risk of cardiovascular diseases.

Exclusions: Sphingolipidosis (5C56.0)

Coded Elsewhere: Lipoid dermatoarthritis (FA38.Y)

Multicentric reticulohistiocytosis (EE8Y)

Lipoid proteinosis (LD27.Y)

5C80 **Hyperlipoproteinaemia**

Disorders of lipoprotein metabolism that result in high levels of lipoproteins in the circulating blood

5C80.0 Hypercholesterolaemia

5C80.00 Primary hypercholesterolaemia

This is a genetic disorder characterised by high cholesterol levels, specifically very high levels of low-density lipoprotein (LDL, "bad cholesterol"), in the blood and early cardiovascular disease.

Coded Elsewhere: Sitosterolaemia (5C52.1Y)

5C80.01 Secondary hypercholesterolaemia

Coding Note: Code also the causing condition

5C80.0Z Hypercholesterolaemia, unspecified

5C80.1 Hypertriglyceridaemia

A form of hyperlipidaemia characterised by abnormally elevated levels of triglyceride-rich lipoproteins in the blood. It is associated with an elevated risk of cardiovascular morbidity.

Inclusions: Hyperlipidaemia, group B

Endogenous hyperglyceridaemia

5C80.2 Mixed hyperlipidaemia

Elevated levels of both LDL cholesterol and triglycerides in the blood

Inclusions: Hyperbetalipoproteinaemia with prebetalipoproteinaemia

Hypercholesterolaemia with endogenous hyperglyceridaemia

Hyperlipidaemia, group C

Exclusions: cerebrotendinous cholesterosis [van Bogaert-Scherer-Epstein] (5C52.11)

5C80.3 Hyperalphalipoproteinaemia

A condition in which high-density lipoprotein is elevated in the blood.

5C80.Y Other specified hyperlipoproteinaemia

5C80.Z Hyperlipoproteinaemia, unspecified

5C81 Hypolipoproteinaemia

Disorders characterised by low level of lipoproteins of any type in the blood

Inclusions: High-density lipoprotein deficiency

5C81.0 Hypoalphalipoproteinaemia

A disorder characterised by low levels of high-density lipoprotein in the blood.

5C81.1 Hypobetalipoproteinaemia

Hypobetalipoproteinemia (HBL) constitutes a group of lipoprotein metabolism disorders that are characterised by permanently low levels (below the 5th percentile) of apolipoprotein B and LDL cholesterol. There are two types of HBL: familial hypobetalipoproteinemia and chylomicron retention disease (CMRD; see these terms). The familial form can be severe with early onset (abetalipoproteinemia/homozygous familial hypobetalipoproteinemia; see this term) or benign (benign familial hypobetalipoproteinemia; see this term). (Please add the sentence). Severe familial HBL and CMRD appear in infancy or childhood. As a result they are often associated with growth delay, diarrhoea with steatorrhoea, and fat malabsorption. Benign familial hypobetalipoproteinemia is generally asymptomatic, but in adults is occasionally associated with dietary intolerance to fat. HBL disorders are caused by mutations in proteins involved in the synthesis, secretion and catabolism of lipoproteins containing apolipoprotein B (LDL, VLDL and chylomicrons).

5C81.Y Other specified hypolipoproteinaemia

5C81.Z Hypolipoproteinaemia, unspecified

5C8Y Other specified disorders of lipoprotein metabolism or lipidaemias

5C8Z Unspecified disorders of lipoprotein metabolism or lipidaemias

5C90 Metabolic or transporter liver disease

Exclusions: Alcoholic liver disease (DB94)

Non-alcoholic fatty liver disease (DB92)

Drug-induced or toxic liver disease (DB95)

Acute fatty liver of pregnancy (JA65.0)

Coded Elsewhere: Bile acid synthesis defect with cholestasis (5C52.11)

Progressive familial intrahepatic cholestasis (5C58.03)

Benign recurrent intrahepatic cholestasis (5C58.04)

Glycogen storage disease (5C51.3)

Disorders of galactose metabolism (5C51.4)

Disorders of fructose metabolism (5C51.5)

Alpha-1-antitrypsin deficiency (5C5A)

Reye syndrome (8E46)

5C90.0 Liver diseases due to urea cycle defects

This is a group of liver diseases due to defects in the urea cycle, which is a metabolic cycle of nitrogen-containing compounds that produces the waste product urea.

Coded Elsewhere: Argininosuccinic aciduria (5C50.A0)

Carbamoylphosphate synthetase deficiency (5C50.A1)

Argininaemia (5C50.A2)

Ornithine carbamoyltransferase deficiency (5C50.AY)

5C90.1 Liver diseases due to disorders of porphyrin or bilirubin metabolism or transport

These are liver diseases due to disorders of porphyrin and bilirubin metabolism and transport

Exclusions: Defects of catalase and peroxidase (5C58)

Coded Elsewhere: Porphyria cutanea tarda (5C58.10)

Variegate porphyria (5C58.13)

Crigler-Najjar syndrome (5C58.00)

Gilbert syndrome (5C58.01)

Dubin-Johnson syndrome (5C58.02)

Rotor syndrome (5C58.0Y)

5C90.2 Liver diseases due to disorders of amino acid metabolism

This is liver disease due to the disorder of the various biochemical processes responsible for the synthesis of proteins and amino acids, and the breakdown of proteins (and other large molecules, too) by catabolism.

Coded Elsewhere: Disorders of tyrosine metabolism (5C50.1)

Citrullinaemia (5C50.A3)

5C90.3 **Liver disease due to disorders of lysosomal storage**

This is liver disease due to a group of approximately 50 rare inherited metabolic disorders that result from defects in lysosomal function.

Coded Elsewhere: Gaucher disease (5C56.0Y)

Niemann-Pick disease (5C56.0Y)

Wolman disease (5C56.0Y)

Cholesteryl ester storage disease (5C56.0Y)

5C90.4 **Liver diseases due to mitochondrial disorders**

This is liver disease due to a group of disorders caused by dysfunctional mitochondria, the organelles that generate energy for the cell.

5C90.5 **Liver diseases due to disorders of mineral metabolism**

This is a liver disease due to a disorder of the organic compound required by an organism as a vital nutrient in limited amounts.

Coding Note: Code also the causing condition

5C90.Y **Other specified metabolic or transporter liver disease**

5C90.Z **Metabolic or transporter liver disease, unspecified**

Other metabolic disorders (5D00-5D0Y)

Exclusions: histiocytosis X (chronic) (2B31.2)

Coded Elsewhere: Tophaceous gout (FA25.20)

5D00 **Amyloidosis**

Amyloidosis is a vast group of diseases defined by the presence of insoluble protein deposits in tissues. Its diagnosis is based on histological findings. Amyloidoses are classified according to clinical signs and biochemical type of amyloid protein involved. Most amyloidoses are multisystemic, 'generalised' or 'diffuse'. There are a few forms of localised amylosis. The most frequent forms are AL amyloidosis (immunoglobulins), AA (inflammatory), and ATTR (transthyretin accumulation).

Exclusions: Dementia due to Alzheimer disease (6D80)

5D00.0 **AL amyloidosis**

AL amyloid is due to the deposition of immunoglobulin light chains in glomeruli where they are seen as Congo red binding fibrils and immuno-stain specifically for kappa or lambda light chains. By light microscopy there is amorphous hyaline material in the mesangium and capillary walls. A light chain producing plasma cell or B-cell dysplasia is responsible. Other organs are also involved in this systemic disease.

Coded Elsewhere: Isolated cerebral amyloid angiopathy (8B22.3)

5D00.1 **AA amyloidosis**

AA amyloid is due to the deposition of the acute phase reactant serum amyloid A protein (SAA) in glomeruli where they are seen as Congo red binding fibrils which immuno- stain specifically for SAA. Chronic inflammation is responsible. Other organs are also involved in this systemic disease.

5D00.2 **Hereditary amyloidosis**

Hereditary amyloidosis (familial amyloidosis) is an inherited disorder that often affects the liver, nerves, heart and kidneys. Many different types of gene abnormalities present at birth are associated with an increased risk of amyloid disease. The type and location of an amyloid gene abnormality can affect the risk of certain complications, the age at which symptoms first appear, and the way the disease progresses over time.

5D00.20 Hereditary ATTR amyloidosis

5D00.21 Non-neuropathic heredofamilial amyloidosis

This is an amyloidosis (the formation of insoluble proteins, or amyloids) of inherited origin that does not affect the peripheral nerves. The most common sites of deposits are associated with the kidney and heart.

Coded Elsewhere: Familial Mediterranean fever with amyloidosis (4A60.0)

5D00.2Y Other specified hereditary amyloidosis

5D00.2Z Hereditary amyloidosis, unspecified

5D00.3 **Dialysis-associated amyloidosis**

Dialysis-related amyloidosis develops when proteins in blood are deposited in joints and tendons — causing pain, stiffness and fluid in the joints, as well as carpal tunnel syndrome. This type generally affects people on long-term dialysis.

5D00.Y **Other specified amyloidosis**

5D00.Z **Amyloidosis, unspecified**

5D01 Tumour lysis syndrome

This is a group of metabolic complications that can occur after treatment of cancer, usually lymphomas and leukaemias, and sometimes even without treatment. These complications are caused by the breakdown products of dying cancer cells and include hyperkalaemia, hyperphosphataemia, hyperuricaemia and hyperuricosuria, hypocalcaemia, and consequent acute uric acid nephropathy and acute renal failure.

Coding Note: Code also the causing condition

5D0Y Other specified metabolic disorders

5D2Z Metabolic disorders, unspecified

Postprocedural endocrine or metabolic disorders (5D40-5D46)

Any endocrine or metabolic disorder caused by or subsequent to any medical procedure.

Coded Elsewhere: Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

5D40 **Postprocedural hypothyroidism**

5D40.0 Postirridation hypothyroidism

5D40.00 Hypothyroidism postradioactive iodine ablation

5D40.0Y Other specified postirridation hypothyroidism

5D40.0Z Postirridation hypothyroidism, unspecified

5D40.Y Other specified postprocedural hypothyroidism

5D40.Z Postprocedural hypothyroidism, unspecified

5D41 **Postprocedural hypoinsulinaemia**

This is a low level of insulin that can result after medical procedures, including radiation, and it carries a risk of developing diabetes mellitus.

Inclusions: Postpancreatectomy hyperglycaemia

Postsurgical hypoinsulinaemia

5D42 **Postprocedural hypoparathyroidism**

This refers to a postprocedural decreased function of the parathyroid glands with underproduction of parathyroid hormone. This can lead to low levels of calcium in the blood, often causing cramping and twitching of muscles or tetany (involuntary muscle contraction), and several other symptoms.

Inclusions: Parathyroprival tetany

5D43 **Postprocedural hypopituitarism**

This is the postprocedural decreased (hypo) secretion of one or more of the eight hormones normally produced by the pituitary gland at the base of the brain. If there is decreased secretion of most pituitary hormones, the term panhypopituitarism (pan meaning "all") is used.

5D44 **Postprocedural ovarian failure**

A condition in women characterised by amenorrhea, caused by or subsequent to any intervention. This condition may also present with hot flashes, night sweats, irritability, poor concentration, decreased sex drive, pain during sex, vaginal dryness.

5D45 **Postprocedural testicular hypofunction**

A condition in men characterised by testosterone deficiency, caused by or subsequent to any intervention. This condition may present with fatigue, decreased libido, erectile dysfunction, negative mood states, decreased lean body mass, increased fat mass, or decreased bone mineral density.

5D46 **Postprocedural adrenocortical hypofunction**

A condition caused by or subsequent to any medical procedure. This condition is characterised by adrenocortical hormone deficiency. This condition may present with chronic fatigue, muscle weakness, loss of appetite, weight loss or abdominal pain.

CHAPTER 06

Mental, behavioural or neurodevelopmental disorders

This chapter has 162 four-character categories.

Code range starts with 6A00

Mental, behavioural and neurodevelopmental disorders are syndromes characterised by clinically significant disturbance in an individual's cognition, emotional regulation, or behaviour that reflects a dysfunction in the psychological, biological, or developmental processes that underlie mental and behavioural functioning. These disturbances are usually associated with distress or impairment in personal, family, social, educational, occupational, or other important areas of functioning.

Exclusions:	Acute stress reaction (QE84)
	Uncomplicated bereavement (QE62)
Coded Elsewhere:	Sleep-wake disorders (7A00-7B2Z)
	Sexual dysfunctions (HA00-HA0Z)
	Gender incongruence (HA60-HA6Z)

This chapter contains the following top level blocks:

- Neurodevelopmental disorders
- Schizophrenia or other primary psychotic disorders
- Catatonia
- Mood disorders
- Anxiety or fear-related disorders
- Obsessive-compulsive or related disorders
- Disorders specifically associated with stress
- Dissociative disorders
- Feeding or eating disorders
- Elimination disorders
- Disorders of bodily distress or bodily experience
- Disorders due to substance use or addictive behaviours
- Impulse control disorders
- Disruptive behaviour or dissocial disorders
- Personality disorders and related traits
- Paraphilic disorders
- Factitious disorders
- Neurocognitive disorders

- Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium
- Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere

Neurodevelopmental disorders (6A00-6A0Z)

Neurodevelopmental disorders are behavioural and cognitive disorders that arise during the developmental period that involve significant difficulties in the acquisition and execution of specific intellectual, motor, language, or social functions. Although behavioural and cognitive deficits are present in many mental and behavioural disorders that can arise during the developmental period (e.g., Schizophrenia, Bipolar disorder), only disorders whose core features are neurodevelopmental are included in this grouping. The presumptive etiology for neurodevelopmental disorders is complex, and in many individual cases is unknown.

Coded Elsewhere: Primary tics or tic disorders (8A05.0)

Secondary neurodevelopmental syndrome (6E60)

6A00 Disorders of intellectual development

Disorders of intellectual development are a group of etiologically diverse conditions originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two or more standard deviations below the mean (approximately less than the 2.3rd percentile), based on appropriately normed, individually administered standardized tests. Where appropriately normed and standardized tests are not available, diagnosis of disorders of intellectual development requires greater reliance on clinical judgment based on appropriate assessment of comparable behavioural indicators.

Coding Note: Use additional code, if desired, to identify any known aetiology.

Exclusions: Dementia (6D80-6D8Z)

6A00.0 Disorder of intellectual development, mild

A mild disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two to three standard deviations below the mean (approximately 0.1 – 2.3 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons often exhibit difficulties in the acquisition and comprehension of complex language concepts and academic skills. Most master basic self-care, domestic, and practical activities. Persons affected by a mild disorder of intellectual development can generally achieve relatively independent living and employment as adults but may require appropriate support.

6A00.1 **Disorder of intellectual development, moderate**

A moderate disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately three to four standard deviations below the mean (approximately 0.003 – 0.1 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Language and capacity for acquisition of academic skills of persons affected by a moderate disorder of intellectual development vary but are generally limited to basic skills. Some may master basic self-care, domestic, and practical activities. Most affected persons require considerable and consistent support in order to achieve independent living and employment as adults.

6A00.2 **Disorder of intellectual development, severe**

A severe disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four of more standard deviations below the mean (less than approximately the 0.003rd percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons exhibit very limited language and capacity for acquisition of academic skills. They may also have motor impairments and typically require daily support in a supervised environment for adequate care, but may acquire basic self-care skills with intensive training. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

6A00.3 **Disorder of intellectual development, profound**

A profound disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four of more standard deviations below the mean (approximately less than the 0.003rd percentile), based on individually administered appropriately normed, standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons possess very limited communication abilities and capacity for acquisition of academic skills is restricted to basic concrete skills. They may also have co-occurring motor and sensory impairments and typically require daily support in a supervised environment for adequate care. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

6A00.4 **Disorder of intellectual development, provisional**

Disorder of intellectual development, provisional is assigned when there is evidence of a disorder of intellectual development but the individual is an infant or child under the age of four or it is not possible to conduct a valid assessment of intellectual functioning and adaptive behaviour because of sensory or physical impairments (e.g., blindness, pre-lingual deafness), motor or communication impairments, severe problem behaviours or co-occurring mental and behavioural disorders.

6A00.Z **Disorders of intellectual development, unspecified**

Coding Note: Use additional code, if desired, to identify any known aetiology.

6A01 **Developmental speech or language disorders**

Developmental speech or language disorders arise during the developmental period and are characterised by difficulties in understanding or producing speech and language or in using language in context for the purposes of communication that are outside the limits of normal variation expected for age and level of intellectual functioning. The observed speech and language problems are not attributable to regional, social, or cultural/ethnic language variations and are not fully explained by anatomical or neurological abnormalities. The presumptive aetiology for Developmental speech or language disorders is complex, and in many individual cases, is unknown.

6A01.0 **Developmental speech sound disorder**

Developmental speech sound disorder is characterised by difficulties in the acquisition, production and perception of speech that result in errors of pronunciation, either in number or types of speech errors made or the overall quality of speech production, that are outside the limits of normal variation expected for age and level of intellectual functioning and result in reduced intelligibility and significantly affect communication. The errors in pronunciation arise during the early developmental period and cannot be explained by social, cultural, and other environmental variations (e.g., regional dialects). The speech errors are not fully explained by a hearing impairment or a structural or neurological abnormality.

Inclusions: Functional speech articulation disorder

Exclusions: Deafness not otherwise specified (AB52)

Diseases of the nervous system (Chapter 08)

Dysarthria (MA80.2)

Verbal apraxia (MB4A)

6A01.1 **Developmental speech fluency disorder**

Developmental speech fluency disorder is characterised by frequent or pervasive disruption of the normal rhythmic flow and rate of speech characterised by repetitions and prolongations in sounds, syllables, words, and phrases, as well as blocking and word avoidance or substitutions. The speech dysfluency is persistent over time. The onset of speech dysfluency occurs during the developmental period and speech fluency is markedly below what would be expected for age. Speech dysfluency results in significant impairment in social communication, personal, family, social, educational, occupational or other important areas of functioning. The speech dysfluency is not better accounted for by a Disorder of Intellectual Development, a Disease of the Nervous System, a sensory impairment, or a structural abnormality, or other speech or voice disorder.

Exclusions: Tic disorders (8A05)

6A01.2 **Developmental language disorder**

Developmental language disorder is characterised by persistent deficits in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The individual's ability to understand, produce or use language is markedly below what would be expected given the individual's age. The language deficits are not explained by another neurodevelopmental disorder or a sensory impairment or neurological condition, including the effects of brain injury or infection.

Exclusions: Autism spectrum disorder (6A02)

Diseases of the nervous system (Chapter 08)

Deafness not otherwise specified (AB52)

Selective mutism (6B06)

6A01.20 Developmental language disorder with impairment of receptive and expressive language

Developmental language disorder with impairment of receptive and expressive language is characterised by persistent difficulties in the acquisition, understanding, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to understand spoken or signed language (i.e., receptive language) is markedly below the expected level given the individual's age and level of intellectual functioning, and is accompanied by persistent impairment in the ability to produce and use spoken or signed language (i.e., expressive language).

Inclusions: developmental dysphasia or aphasia, receptive type

Exclusions: acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)

Autism spectrum disorder (6A02)

Selective mutism (6B06)

dysphasia NOS (MA80.1)

Diseases of the nervous system (Chapter 08)

Deafness not otherwise specified (AB52)

6A01.21 Developmental language disorder with impairment of mainly expressive language

Developmental language disorder with impairment of mainly expressive language is characterised by persistent difficulties in the acquisition, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to produce and use spoken or signed language (i.e., expressive language) is markedly below the expected level given the individual's age and level of intellectual functioning, but the ability to understand spoken or signed language (i.e., receptive language) is relatively intact.

Inclusions: Developmental dysphasia or aphasia, expressive type

Exclusions: acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)

Selective mutism (6B06)

dysphasia and aphasia: developmental, receptive type (6A01.20)

dysphasia NOS (MA80.1)

aphasia NOS (MA80.0)

Diseases of the nervous system (Chapter 08)

Deafness not otherwise specified (AB52)

6A01.22 Developmental language disorder with impairment of mainly pragmatic language

Developmental language disorder with impairment of mainly pragmatic language is characterised by persistent and marked difficulties with the understanding and use of language in social contexts, for example making inferences, understanding verbal humour, and resolving ambiguous meaning. These difficulties arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. Pragmatic language abilities are markedly below the expected level given the individual's age and level of intellectual functioning, but the other components of receptive and expressive language are relatively intact. This qualifier should not be used if the pragmatic language impairment is better explained by Autism Spectrum Disorder or by impairments in other components of receptive or expressive language.

Exclusions: Diseases of the nervous system (Chapter 08)

Selective mutism (6B06)

6A01.23 Developmental language disorder, with other specified language impairment

Developmental language disorder with other specified language impairment is characterised by persistent difficulties in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period and cause significant limitations in the individual's ability to communicate. The pattern of specific deficits in language abilities is not adequately captured by any of the other developmental language disorder categories.

Exclusions: Autism spectrum disorder (6A02)

Diseases of the nervous system (Chapter 08)

Disorders of intellectual development (6A00)

Selective mutism (6B06)

6A01.Y **Other specified developmental speech or language disorders**

6A01.Z **Developmental speech or language disorders, unspecified**

6A02 Autism spectrum disorder

Autism spectrum disorder is characterised by persistent deficits in the ability to initiate and to sustain reciprocal social interaction and social communication, and by a range of restricted, repetitive, and inflexible patterns of behaviour, interests or activities that are clearly atypical or excessive for the individual's age and sociocultural context. The onset of the disorder occurs during the developmental period, typically in early childhood, but symptoms may not become fully manifest until later, when social demands exceed limited capacities. Deficits are sufficiently severe to cause impairment in personal, family, social, educational, occupational or other important areas of functioning and are usually a pervasive feature of the individual's functioning observable in all settings, although they may vary according to social, educational, or other context. Individuals along the spectrum exhibit a full range of intellectual functioning and language abilities.

Inclusions: Autistic disorder

Exclusions: Rett syndrome (LD90.4)

6A02.0 **Autism spectrum disorder without disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

6A02.1 **Autism spectrum disorder with disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

6A02.2 **Autism spectrum disorder without disorder of intellectual development and with impaired functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

6A02.3 **Autism spectrum disorder with disorder of intellectual development and with impaired functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

6A02.5 **Autism spectrum disorder with disorder of intellectual development and with absence of functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is complete, or almost complete, absence of ability relative to the individual's age to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires

6A02.Y **Other specified autism spectrum disorder**

6A02.Z **Autism spectrum disorder, unspecified**

6A03 Developmental learning disorder

Developmental learning disorder is characterised by significant and persistent difficulties in learning academic skills, which may include reading, writing, or arithmetic. The individual's performance in the affected academic skill(s) is markedly below what would be expected for chronological age and general level of intellectual functioning, and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder first manifests when academic skills are taught during the early school years. Developmental learning disorder is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.

Exclusions: Symbolic dysfunctions (MB4B)

6A03.0 **Developmental learning disorder with impairment in reading**

Developmental learning disorder with impairment in reading is characterised by significant and persistent difficulties in learning academic skills related to reading, such as word reading accuracy, reading fluency, and reading comprehension. The individual's performance in reading is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in reading is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.

Exclusions: Disorders of intellectual development (6A00)

6A03.1 Developmental learning disorder with impairment in written expression

Developmental learning disorder with impairment in written expression is characterised by significant and persistent difficulties in learning academic skills related to writing, such as spelling accuracy, grammar and punctuation accuracy, and organisation and coherence of ideas in writing. The individual's performance in written expression is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in written expression is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.

Exclusions: Disorders of intellectual development (6A00)

6A03.2 Developmental learning disorder with impairment in mathematics

Developmental learning disorder with impairment in mathematics is characterised by significant and persistent difficulties in learning academic skills related to mathematics or arithmetic, such as number sense, memorization of number facts, accurate calculation, fluent calculation, and accurate mathematic reasoning. The individual's performance in mathematics or arithmetic is markedly below what would be expected for chronological or developmental age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in mathematics is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.

Exclusions: Disorders of intellectual development (6A00)

6A03.3 Developmental learning disorder with other specified impairment of learning

Developmental learning disorder with other specified impairment of learning is characterised by significant and persistent difficulties in learning academic skills other than reading, mathematics, and written expression. The individual's performance in the relevant academic skill is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with other specified impairment of learning is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.

Exclusions: Disorders of intellectual development (6A00)

6A03.Z Developmental learning disorder, unspecified

6A04

Developmental motor coordination disorder

Developmental motor coordination disorder is characterised by a significant delay in the acquisition of gross and fine motor skills and impairment in the execution of coordinated motor skills that manifest in clumsiness, slowness, or inaccuracy of motor performance. Coordinated motor skills are markedly below that expected given the individual's chronological age and level of intellectual functioning. Onset of coordinated motor skills difficulties occurs during the developmental period and is typically apparent from early childhood. Coordinated motor skills difficulties cause significant and persistent limitations in functioning (e.g. in activities of daily living, school work, and vocational and leisure activities). Difficulties with coordinated motor skills are not solely attributable to a Disease of the Nervous System, Disease of the Musculoskeletal System or Connective Tissue, sensory impairment, and not better explained by a Disorder of Intellectual Development.

Exclusions: Abnormalities of gait and mobility (MB44)

Diseases of the musculoskeletal system or connective tissue (Chapter 15)

Diseases of the nervous system (Chapter 08)

6A05

Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder is characterised by a persistent pattern (at least 6 months) of inattention and/or hyperactivity-impulsivity that has a direct negative impact on academic, occupational, or social functioning. There is evidence of significant inattention and/or hyperactivity-impulsivity symptoms prior to age 12, typically by early to mid-childhood, though some individuals may first come to clinical attention later. The degree of inattention and hyperactivity-impulsivity is outside the limits of normal variation expected for age and level of intellectual functioning. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences. The relative balance and the specific manifestations of inattentive and hyperactive-impulsive characteristics varies across individuals and may change over the course of development. In order for a diagnosis to be made, manifestations of inattention and/or hyperactivity-impulsivity must be evident across multiple situations or settings (e.g., home, school, work, with friends or relatives), but are likely to vary according to the structure and demands of the setting. Symptoms are not better accounted for by another mental, behavioural, or neurodevelopmental disorder and are not due to the effect of a substance or medication.

Inclusions: attention deficit disorder with hyperactivity

attention deficit syndrome with hyperactivity

6A05.0 Attention deficit hyperactivity disorder, predominantly inattentive presentation

All definitional requirements for attention deficit hyperactivity disorder are met and inattentive symptoms are predominant in the clinical presentation. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Some hyperactive-impulsive symptoms may also be present, but these are not clinically significant in relation to the inattentive symptoms.

6A05.1 Attention deficit hyperactivity disorder, predominantly hyperactive-impulsive presentation

All definitional requirements for attention deficit hyperactivity disorder are met and hyperactive-impulsive symptoms are predominant in the clinical presentation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences. Some inattentive symptoms may also be present, but these are not clinically significant in relation to the hyperactive-impulsive symptoms.

6A05.2 Attention deficit hyperactivity disorder, combined presentation

All definitional requirements for attention deficit hyperactivity disorder are met. Both inattentive and hyperactive-impulsive symptoms are clinically significant, with neither predominating in the clinical presentation. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences.

6A05.Y Attention deficit hyperactivity disorder, other specified presentation

6A05.Z Attention deficit hyperactivity disorder, presentation unspecified

6A06 Stereotyped movement disorder

Stereotyped movement disorder is characterised by the persistent (e.g., lasting several months) presence of voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal), and markedly interfere with normal activities or result in self-inflicted bodily injury. Stereotyped movements that are non-injurious can include body rocking, head rocking, finger-flicking mannerisms, and hand flapping. Stereotyped self-injurious behaviours can include repetitive head banging, face slapping, eye poking, and biting of the hands, lips, or other body parts.

Exclusions: Tic disorders (8A05)

Trichotillomania (6B25.0)

Abnormal involuntary movements (MB46)

6A06.0 Stereotyped movement disorder without self-injury

This category should be applied to forms of Stereotyped movement disorder in which stereotyped behaviours markedly interfere with normal activities, but do not result in self-inflicted bodily injury. Stereotyped movement disorder without self-injury is characterised by voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal), and markedly interfere with normal activities. Stereotyped movements that are non-injurious can include body rocking, head rocking, finger-flicking mannerisms, and hand flapping.

6A06.1 Stereotyped movement disorder with self-injury

This category should be applied to forms of Stereotyped movement disorder in which stereotyped behaviours result in self-inflicted bodily injury that is significant enough to require medical treatment, or would result in such injury if protective measures (e.g., helmet to prevent head injury) were not employed. Stereotyped movement disorder with self-injury is characterised by voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal). Stereotyped movements that are self-injurious can include head banging, face slapping, eye poking, and biting of the hands, lips, or other body parts.

6A06.Z Stereotyped movement disorder, unspecified

6A0Y Other specified neurodevelopmental disorders

6A0Z Neurodevelopmental disorders, unspecified

Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Schizophrenia and other primary psychotic disorders are characterised by significant impairments in reality testing and alterations in behaviour manifest in positive symptoms such as persistent delusions, persistent hallucinations, disorganised thinking (typically manifest as disorganised speech), grossly disorganised behaviour, and experiences of passivity and control, negative symptoms such as blunted or flat affect and avolition, and psychomotor disturbances. The symptoms occur with sufficient frequency and intensity to deviate from expected cultural or subcultural norms. These symptoms do not arise as a feature of another mental and behavioural disorder (e.g., a mood disorder, delirium, or a disorder due to substance use). The categories in this grouping should not be used to classify the expression of ideas, beliefs, or behaviours that are culturally sanctioned.

Coded Elsewhere: Substance-induced psychotic disorders

Secondary psychotic syndrome (6E61)

6A20 **Schizophrenia**

Schizophrenia is characterised by disturbances in multiple mental modalities, including thinking (e.g., delusions, disorganisation in the form of thought), perception (e.g., hallucinations), self-experience (e.g., the experience that one's feelings, impulses, thoughts, or behaviour are under the control of an external force), cognition (e.g., impaired attention, verbal memory, and social cognition), volition (e.g., loss of motivation), affect (e.g., blunted emotional expression), and behaviour (e.g., behaviour that appears bizarre or purposeless, unpredictable or inappropriate emotional responses that interfere with the organisation of behaviour). Psychomotor disturbances, including catatonia, may be present. Persistent delusions, persistent hallucinations, thought disorder, and experiences of influence, passivity, or control are considered core symptoms. Symptoms must have persisted for at least one month in order for a diagnosis of schizophrenia to be assigned. The symptoms are not a manifestation of another health condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g., corticosteroids), including withdrawal (e.g., alcohol withdrawal).

Exclusions: Schizotypal disorder (6A22)

schizophrenic reaction (6A22)

Acute and transient psychotic disorder (6A23)

6A20.0 Schizophrenia, first episode

Schizophrenia, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizophrenia were met.

6A20.00 Schizophrenia, first episode, currently symptomatic

All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

6A20.01 Schizophrenia, first episode, in partial remission

All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A20.02 Schizophrenia, first episode, in full remission

All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A20.0Z Schizophrenia, first episode, unspecified

6A20.1 Schizophrenia, multiple episodes

Schizophrenia, multiple episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia and who have also previously experienced episodes during which diagnostic requirements were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during periods of remission, and remissions may have occurred in response to medication or other treatment.

6A20.10 Schizophrenia, multiple episodes, currently symptomatic

All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.

6A20.11 Schizophrenia, multiple episodes, in partial remission

All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A20.12 Schizophrenia, multiple episodes, in full remission

All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A20.1Z Schizophrenia, multiple episodes, unspecified

6A20.2 Schizophrenia, continuous

Symptoms fulfilling all definitional requirements of Schizophrenia have been present for almost all of the illness course over a period of at least one year, with periods of subthreshold symptoms being very brief relative to the overall course.

6A20.20 Schizophrenia, continuous, currently symptomatic

All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration are currently met, or have been met within the past one month.

6A20.21 Schizophrenia, continuous, in partial remission

All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A20.22 Schizophrenia, continuous, in full remission

All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A20.2Z Schizophrenia, continuous, unspecified

6A20.Y Other specified episode of schizophrenia

6A20.Z Schizophrenia, episode unspecified

6A21 Schizoaffective disorder

Schizoaffective disorder is an episodic disorder in which the diagnostic requirements of schizophrenia and a manic, mixed, or moderate or severe depressive episode are met within the same episode of illness, either simultaneously or within a few days of each other. Prominent symptoms of schizophrenia (e.g. delusions, hallucinations, disorganisation in the form of thought, experiences of influence, passivity and control) are accompanied by typical symptoms of a moderate or severe depressive episode (e.g. depressed mood, loss of interest, reduced energy), a manic episode (e.g. an extreme mood state characterised by euphoria, irritability, or expansiveness; increased activity or a subjective experience of increased energy) or a mixed episode. Psychomotor disturbances, including catatonia, may be present. Symptoms must have persisted for at least one month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumor) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal).

6A21.0 Schizoaffective disorder, first episode

Schizoaffective disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met.

6A21.00 Schizoaffective disorder, first episode, currently symptomatic

All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

6A21.01 Schizoaffective disorder, first episode, in partial remission

All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A21.02 Schizoaffective disorder, first episode, in full remission

All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A21.0Z Schizoaffective disorder, first episode, unspecified

6A21.1 Schizoaffective disorder, multiple episodes

Schizoaffective disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder and who have also previously experienced episodes during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during period of remission, and remissions may have occurred in response to medication or other treatment.

6A21.10 Schizoaffective disorder, multiple episodes, currently symptomatic

All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.

6A21.11 Schizoaffective disorder, multiple episodes, in partial remission

All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A21.12 Schizoaffective disorder, multiple episodes, in full remission

All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A21.1Z Schizoaffective disorder, multiple episodes, unspecified

6A21.2 **Schizoaffective disorder, continuous**

Symptoms fulfilling all definitional requirements of Schizoaffective disorder have been present for almost all of the illness course over a period of at least one year, with periods of subthreshold symptoms being very brief relative to the overall course.

6A21.20 Schizoaffective disorder, continuous, currently symptomatic

All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration are currently met, or have been met within the past one month.

6A21.21 Schizoaffective disorder, continuous, in partial remission

All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A21.22 Schizoaffective disorder, continuous, in full remission

All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A21.2Z Schizoaffective disorder, continuous, unspecified

6A21.Y **Other specified schizoaffective disorder**

6A21.Z **Schizoaffective disorder, unspecified**

6A22 Schizotypal disorder

Schizotypal disorder is characterised by an enduring pattern (i.e. characteristic of the person's functioning over a period of at least several years) of eccentricities in behaviour, appearance and speech, accompanied by cognitive and perceptual distortions, unusual beliefs, and discomfort with— and often reduced capacity for— interpersonal relationships. Symptoms may include constricted or inappropriate affect and anhedonia. Paranoid ideas, ideas of reference, or other psychotic symptoms, including hallucinations in any modality, may occur, but are not of sufficient intensity or duration to meet the diagnostic requirements of schizophrenia, schizoaffective disorder, or delusional disorder. The symptoms cause distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: Schizotypal personality disorder

Exclusions: Autism spectrum disorder (6A02)

Personality disorder (6D10)

6A23 **Acute and transient psychotic disorder**

Acute and transient psychotic disorder is characterised by acute onset of psychotic symptoms that emerge without a prodrome and reach their maximal severity within two weeks. Symptoms may include delusions, hallucinations, disorganisation of thought processes, perplexity or confusion, and disturbances of affect and mood. Catatonia-like psychomotor disturbances may be present. Symptoms typically change rapidly, both in nature and intensity, from day to day, or even within a single day. The duration of the episode does not exceed 3 months, and most commonly lasts from a few days to 1 month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal).

6A23.0 Acute and transient psychotic disorder, first episode

Acute and transient psychotic disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder but who have never before experienced a similar episode.

6A23.00 Acute and transient psychotic disorder, first episode, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

6A23.01 Acute and transient psychotic disorder, first episode, in partial remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A23.02 Acute and transient psychotic disorder, first episode, in full remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A23.0Z Acute and transient psychotic disorder, first episode, unspecified

6A23.1 Acute and transient psychotic disorder, multiple episodes

Acute and transient psychotic disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder and who have experienced similar episodes in the past.

6A23.10 Acute and transient psychotic disorder, multiple episodes, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.

6A23.11 Acute and transient psychotic disorder, multiple episodes, in partial remission

All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A23.12 Acute and transient psychotic disorder, multiple episodes, in full remission

All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A23.1Z Acute and transient psychotic disorder, multiple episodes, unspecified

6A23.Y Other specified acute and transient psychotic disorder

6A23.Z Acute and transient psychotic disorder, unspecified

6A24 Delusional disorder

Delusional disorder is characterised by the development of a delusion or set of related delusions, typically persisting for at least 3 months and often much longer, in the absence of a Depressive, Manic, or Mixed mood episode. The delusions are variable in content across individuals, but typically stable within individuals, although they may evolve over time. Other characteristic symptoms of Schizophrenia (i.e. clear and persistent hallucinations, negative symptoms, disorganised thinking, or experiences of influence, passivity, or control) are not present, although various forms of perceptual disturbances (e.g. hallucinations, illusions, misidentifications of persons) thematically related to the delusion are still consistent with the diagnosis. Apart from actions and attitudes directly related to the delusion or delusional system, affect, speech, and behavior are typically unaffected. The symptoms are not a manifestation of another medical condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal effects (e.g. alcohol withdrawal).

6A24.0 Delusional disorder, currently symptomatic

All definitional requirements for Delusional disorder in terms of symptoms and duration are currently met, or have been met within the past one month.

6A24.1 Delusional disorder, in partial remission

All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

6A24.2 **Delusional disorder, in full remission**

All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

6A24.Z **Delusional disorder, unspecified**

6A25 Symptomatic manifestations of primary psychotic disorders

These categories may be used to characterize the current clinical presentation in individuals diagnosed with Schizophrenia or another primary psychotic disorder, and should not be used in individuals without such a diagnosis. Multiple categories may be applied. Symptoms attributable to the direct pathophysiological consequences of a health condition or injury not classified under Mental, behavioural or neurodevelopmental disorders (e.g., a brain tumour or traumatic brain injury), or to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, should not be considered as examples of the respective types of symptoms.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.0 **Positive symptoms in primary psychotic disorders**

Positive symptoms in primary psychotic disorders include persistent delusions, persistent hallucinations (most commonly verbal auditory hallucinations), disorganised thinking (formal thought disorder such as loose associations, thought derailment, or incoherence), grossly disorganised behaviour (behaviour that appears bizarre, purposeless and not goal-directed) and experiences of passivity and control (the experience that one's feelings, impulses, or thoughts are under the control of an external force). The rating should be made based on the severity of positive symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.1 **Negative symptoms in primary psychotic disorders**

Negative symptoms in primary psychotic disorders include constricted, blunted, or flat affect, alogia or paucity of speech, avolition (general lack of drive, or lack of motivation to pursue meaningful goals), asociality (reduced or absent engagement with others and interest in social interaction) and anhedonia (inability to experience pleasure from normally pleasurable activities). To be considered negative psychotic symptoms, relevant symptoms should not be entirely attributable to antipsychotic drug treatment, a depressive disorder, or an under-stimulating environment, and should not be a direct consequence of a positive symptom (e.g., persecutory delusions causing a person to become socially isolated due to fear of harm). The rating should be made based on the severity of negative symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.2 **Depressive mood symptoms in primary psychotic disorders**

Depressive mood symptoms in primary psychotic disorders refer to depressed mood as reported by the individual (feeling down, sad) or manifested as a sign (e.g. tearful, defeated appearance). If only non-mood symptoms of a depressive episode are present (e.g., anhedonia, psychomotor slowing), this descriptor should not be used. This descriptor may be used whether or not depressive symptoms meet the diagnostic requirements of a separately diagnosed Depressive disorder. The rating should be made based on the severity of depressive mood symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.3 **Manic mood symptoms in primary psychotic disorders**

Manic mood symptoms in primary psychotic disorders refer to elevated, euphoric, irritable, or expansive mood states, including rapid changes among different mood states (i.e., mood lability). It also includes increased subjective experience of energy, which may be accompanied by increased goal-directed activity. The severity of associated non-mood symptoms of a Manic or Hypomanic Episode (e.g., decreased need for sleep, distractibility) should not be considered in making a rating. Increased non-goal-directed psychomotor activity should be considered as part of the rating of the 'psychomotor symptoms in primary psychotic disorders' rather than here. This descriptor may be used whether or not the manic symptoms meet the diagnostic requirements of a separately diagnosed bipolar disorder. The rating should be made based on the severity of manic mood symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.4 **Psychomotor symptoms in primary psychotic disorders**

Psychomotor symptoms in primary psychotic disorders include psychomotor agitation or excessive motor activity, usually manifested by purposeless behaviours such as fidgeting, shifting, fiddling, inability to sit or stand still, wringing of the hands, psychomotor retardation, or a visible generalised slowing of movements and speech, and catatonic symptoms such as excitement, posturing, waxy flexibility, negativism, mutism, or stupor. The rating should be made based on the severity of psychomotor symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

6A25.5 Cognitive symptoms in primary psychotic disorders

Cognitive symptoms in primary psychotic disorders refer to cognitive impairment in any of the following domains: speed of processing, attention/concentration, orientation, judgment, abstraction, verbal or visual learning, and working memory. The cognitive impairment is not attributable to a neurodevelopmental disorder, a delirium or other neurocognitive disorder, or the direct effects of a substance or medication on the central nervous system, including withdrawal effects. Ideally, use of this category should be based on the results of locally validated, standardized neuropsychological assessments, although such measures may not be available in all settings. The rating should be made based on the severity of cognitive symptoms during the past week.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

Exclusions: Neurocognitive disorders (6D70-6E0Z)

Neurodevelopmental disorders (6A00-6A0Z)

6A2Y **Other specified primary psychotic disorder**

6A2Z **Schizophrenia or other primary psychotic disorders, unspecified**

Catatonia (6A40-6A4Z)

Catatonia is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abormal psychomotor activity. The assessment of catatonia is complex and requires observation, interview and physical exam. Catatonia can occur in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder. Catatonia can also develop during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin). Finally, Catatonia can occur as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

Exclusions: Harmful effects of drugs, medicaments or biological substances, not elsewhere classified (NE60)

Coded Elsewhere: Secondary catatonia syndrome (6E69)

6A40 **Catatonia associated with another mental disorder**

Catatonia associated with another mental disorder is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abormal psychomotor activity, which occurs in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder.

6A41 **Catatonia induced by substances or medications**

Catatonia induced by substances or medications is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abormal psychomotor activity, which develops during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin).

Exclusions: Neuroleptic malignant syndrome (8A00-8A0Z)

Serotonin syndrome (8D85)

6A4Z **Catatonia, unspecified**

Coding Note: Code also the causing condition

Mood disorders (6A60-6A8Z)

Mood Disorders refers to a superordinate grouping of Bipolar and Depressive Disorders. Mood disorders are defined according to particular types of mood episodes and their pattern over time. The primary types of mood episodes are Depressive episode, Manic episode, Mixed episode, and Hypomanic episode. Mood episodes are not independently diagnosable entities, and therefore do not have their own diagnostic codes. Rather, mood episodes make up the primary components of most of the Depressive and Bipolar Disorders.

Coded Elsewhere: Substance-induced mood disorders

Secondary mood syndrome (6E62)

Bipolar or related disorders (6A60-6A6Z)

Bipolar and related disorders are episodic mood disorders defined by the occurrence of Manic, Mixed or Hypomanic episodes or symptoms. These episodes typically alternate over the course of these disorders with Depressive episodes or periods of depressive symptoms.

6A60 **Bipolar type I disorder**

Bipolar type I disorder is an episodic mood disorder defined by the occurrence of one or more manic or mixed episodes. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. Although the diagnosis can be made based on evidence of a single manic or mixed episode, typically manic or mixed episodes alternate with depressive episodes over the course of the disorder.

Exclusions: Cyclothymia (6A62)

Bipolar type II disorder (6A61)

6A60.0 Bipolar type I disorder, current episode manic, without psychotic symptoms

Bipolar type I disorder, current episode manic, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met, the current episode is manic, and there are no delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

6A60.1 Bipolar type I disorder, current episode manic, with psychotic symptoms

Bipolar type I disorder, current episode manic with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I Disorder have been met, the current episode is Manic and there are delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

6A60.2 Bipolar type I disorder, current episode hypomanic

Bipolar type I disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

6A60.3 Bipolar type I disorder, current episode depressive, mild

Bipolar type I disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one of more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

6A60.4 Bipolar type I disorder, current episode depressive, moderate without psychotic symptoms

Bipolar type I disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A60.5 Bipolar type I disorder, current episode depressive, moderate with psychotic symptoms

Bipolar type I disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A60.6 Bipolar type I disorder, current episode depressive, severe without psychotic symptoms

Bipolar type I disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

6A60.7 Bipolar type I disorder, current episode depressive, severe with psychotic symptoms

Bipolar type I disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

6A60.8 Bipolar type I disorder, current episode depressive, unspecified severity

Bipolar type I disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

6A60.9 Bipolar type I disorder, current episode mixed, without psychotic symptoms

Bipolar type I disorder, current episode mixed, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are no delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.

6A60.A Bipolar type I disorder, current episode mixed, with psychotic symptoms

Bipolar type I disorder, current episode mixed, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.

6A60.B Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic

Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a manic or hypomanic episode. The full definitional requirements for a manic or hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than manic or hypomanic, but do not satisfy the definitional requirements for a depressive episode.

6A60.C Bipolar type I disorder, currently in partial remission, most recent episode depressive

Bipolar type I disorder, currently in partial remission, most recent episode depressive is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a depressive episode. The full definitional requirements for the episode are no longer met but some significant depressive symptoms remain.

6A60.D **Bipolar type I disorder, currently in partial remission, most recent episode mixed**

Bipolar type I disorder, currently in partial remission, most recent episode mixed is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a mixed episode. The full definitional requirements for the episode are no longer met but some significant mood symptoms remain.

6A60.E **Bipolar type I disorder, currently in partial remission, most recent episode unspecified**

Bipolar type I disorder, currently in partial remission, most recent episode unspecified is diagnosed when the definitional requirements for Bipolar type I disorder have been met but there is insufficient information to determine the nature of the most recent mood episode. The full definitional requirements for a mood episode are no longer met but some significant mood symptoms remain.

6A60.F **Bipolar type I disorder, currently in full remission**

Bipolar type I disorder, currently in full remission is diagnosed when the full definitional requirements for Bipolar I disorder have been met in the past but there are no longer any significant mood symptoms.

6A60.Y **Other specified bipolar type I disorder**

6A60.Z **Bipolar type I disorder, unspecified**

6A61 Bipolar type II disorder

Bipolar type II disorder is an episodic mood disorder defined by the occurrence of one or more hypomanic episodes and at least one depressive episode. A hypomanic episode is a persistent mood state lasting for at least several days characterised by persistent elevation of mood or increased irritability as well as increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as increased talkativeness, rapid or racing thoughts, increased self-esteem, decreased need for sleep, distractability, and impulsive or reckless behavior. The symptoms represent a change from the individual’s typical mood, energy level, and behavior but are not severe enough to cause marked impairment in functioning. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as changes in appetite or sleep, psychomotor agitation or retardation, fatigue, feelings of worthless or excessive or inappropriate guilt, feelings or hopelessness, difficulty concentrating, and suicidality. There is no history of manic or mixed episodes.

6A61.0 Bipolar type II disorder, current episode hypomanic

Bipolar type II disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

6A61.1 Bipolar type II disorder, current episode depressive, mild

Bipolar type II disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one of more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

6A61.2 Bipolar type II disorder, current episode depressive, moderate without psychotic symptoms

Bipolar type II disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A61.3 Bipolar type II disorder, current episode depressive, moderate with psychotic symptoms

Bipolar type II disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A61.4 Bipolar type II disorder, current episode depressive, severe without psychotic symptoms

Bipolar type II disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

6A61.5 Bipolar type II disorder, current episode depressive, severe with psychotic symptoms

Bipolar type II disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

6A61.6 Bipolar type II disorder, current episode depressive, unspecified severity

Bipolar type II disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

6A61.7 Bipolar type II disorder, currently in partial remission, most recent episode hypomanic

Bipolar type II disorder, currently in partial remission, most recent episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the most recent episode was a hypomanic episode. The full definitional requirements for a hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than hypomanic, but do not satisfy the definitional requirements for a depressive episode.

6A61.8 Bipolar type II disorder, currently in partial remission, most recent episode depressive

Bipolar type II disorder, currently in partial remission, most recent episode depressive is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the most recent episode was a depressive episode. The full definitional requirements for the episode are no longer met but some significant depressive symptoms remain.

6A61.9 Bipolar type II disorder, currently in partial remission, most recent episode unspecified

Bipolar type II disorder, currently in partial remission, most recent episode unspecified is diagnosed when the definitional requirements for Bipolar type II disorder have been met but there is insufficient information to determine the nature of the most recent mood episode. The full definitional requirements for a mood episode are no longer met but some significant mood symptoms remain.

6A61.A Bipolar type II disorder, currently in full remission

Bipolar type II disorder, currently in full remission, is diagnosed when the definitional requirements for Bipolar type II disorder have been met but there are no longer any significant mood symptoms.

6A61.Y Other specified bipolar type II disorder

6A61.Z Bipolar type II disorder, unspecified

6A62 **Cyclothymic disorder**

Cyclothymic disorder is characterised by a persistent instability of mood over a period of at least 2 years, involving numerous periods of hypomanic (e.g., euphoria, irritability, or expansiveness, psychomotor activation) and depressive (e.g., feeling down, diminished interest in activities, fatigue) symptoms that are present during more of the time than not. The hypomanic symptomatology may or may not be sufficiently severe or prolonged to meet the full definitional requirements of a hypomanic episode (see Bipolar type II disorder), but there is no history of manic or mixed episodes (see Bipolar type I disorder). The depressive symptomatology has never been sufficiently severe or prolonged to meet the diagnostic requirements for a depressive episode (see Bipolar type II disorder). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: Cycloid personality

Cyclothymic personality

6A6Y **Other specified bipolar or related disorders**

6A6Z **Bipolar or related disorders, unspecified**

Depressive disorders (6A70-6A7Z)

Depressive disorders are characterised by depressive mood (e.g., sad, irritable, empty) or loss of pleasure accompanied by other cognitive, behavioural, or neurovegetative symptoms that significantly affect the individual's ability to function. A depressive disorder should not be diagnosed in individuals who have ever experienced a manic, mixed or hypomanic episode, which would indicate the presence of a bipolar disorder.

Coded Elsewhere: Premenstrual dysphoric disorder (GA34.41)

6A70 **Single episode depressive disorder**

Single episode depressive disorder is characterised by the presence or history of one depressive episode when there is no history of prior depressive episodes. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a bipolar disorder.

Exclusions: recurrent depressive disorder (6A71)

Adjustment disorder (6B43)

Bipolar or related disorders (6A60-6A6Z)

6A70.0 Single episode depressive disorder, mild

Single episode depressive disorder, mild, is diagnosed when the definitional requirements of a Depressive episode are met and the episode is of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one of more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

6A70.1 Single episode depressive disorder, moderate, without psychotic symptoms

Single episode depressive disorder, moderate, without psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A70.2 Single episode depressive disorder, moderate, with psychotic symptoms

Single episode depressive disorder, moderate, with psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A70.3 Single episode depressive disorder, severe, without psychotic symptoms

Single episode depressive disorder, severe, without psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

Inclusions: Major depression single episode without psychotic symptoms

Vital depression single episode without psychotic symptoms

6A70.4 Single episode depressive disorder, severe, with psychotic symptoms

Single episode depressive disorder, severe, with psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

6A70.5 Single episode depressive disorder, unspecified severity

Single episode depressive disorder, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, and there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

6A70.6 Single episode depressive disorder, currently in partial remission

Single episode depressive disorder, currently in partial remission, is diagnosed when the full definitional requirements for a depressive episode have been met and there is no history of prior depressive episodes. The full definitional requirements for a depressive episode are no longer met but some significant mood symptoms remain.

6A70.7 Single episode depressive disorder, currently in full remission

Single episode depressive disorder, currently in full remission is diagnosed when the full definitional requirements for one depressive episode have been met in the past and there are no longer any significant mood symptoms. There is no history of depressive episodes preceding the episode under consideration.

6A70.Y Other specified single episode depressive disorder

6A70.Z Single episode depressive disorder, unspecified

6A71 Recurrent depressive disorder

Recurrent depressive disorder is characterised by a history or at least two depressive episodes separated by at least several months without significant mood disturbance. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a Bipolar disorder.

Inclusions: seasonal depressive disorder

Exclusions: Adjustment disorder (6B43)

Bipolar or related disorders (6A60-6A6Z)

Single episode depressive disorder (6A70)

6A71.0 Recurrent depressive disorder, current episode mild

Recurrent depressive disorder, current episode mild is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one of more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

6A71.1 Recurrent depressive disorder, current episode moderate, without psychotic symptoms

Recurrent depressive disorder, current episode moderate, without psychotic symptoms is diagnosed when the definitional requirements for recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A71.2 Recurrent depressive disorder, current episode moderate, with psychotic symptoms

Recurrent depressive disorder, current episode moderate, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

6A71.3 Recurrent depressive disorder, current episode severe, without psychotic symptoms

Recurrent depressive disorder, current episode severe, without psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

Inclusions: Endogenous depression without psychotic symptoms

Major depression, recurrent without psychotic symptoms

Manic-depressive psychosis, depressed type without psychotic symptoms

Vital depression, recurrent without psychotic symptoms

6A71.4 Recurrent depressive disorder, current episode severe, with psychotic symptoms

Recurrent depressive disorder, current episode severe, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

Inclusions: Endogenous depression with psychotic symptoms

Manic-depressive psychosis, depressed type with psychotic symptoms

6A71.5 **Recurrent depressive disorder, current episode, unspecified severity**

Recurrent depressive disorder current episode, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met and there is a history of prior depressive episodes, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of almost daily depressed mood or diminished interest in activities lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

6A71.6 **Recurrent depressive disorder, currently in partial remission**

Recurrent depressive disorder, currently in partial remission, is diagnosed when the definitional requirements for Recurrent depressive disorder have been met; the full definitional requirements for a depressive episode are no longer met but some significant mood symptoms remain.

6A71.7 **Recurrent depressive disorder, currently in full remission**

Recurrent depressive disorder, currently in full remission is diagnosed when the definitional requirements for recurrent depressive disorder have been met but currently there are no significant mood symptoms.

6A71.Y **Other specified recurrent depressive disorder**

6A71.Z **Recurrent depressive disorder, unspecified**

6A72 Dysthymic disorder

Dysthymic disorder is characterised by a persistent depressive mood (i.e., lasting 2 years or more), for most of the day, for more days than not. In children and adolescents depressed mood can manifest as pervasive irritability. The depressed mood is accompanied by additional symptoms such as markedly diminished interest or pleasure in activities, reduced concentration and attention or indecisiveness, low self-worth or excessive or inappropriate guilt, hopelessness about the future, disturbed sleep or increased sleep, diminished or increased appetite, or low energy or fatigue. During the first 2 years of the disorder, there has never been a 2-week period during which the number and duration of symptoms were sufficient to meet the diagnostic requirements for a Depressive Episode. There is no history of Manic, Mixed, or Hypomanic Episodes.

Inclusions: Dysthymia

Exclusions: anxiety depression (mild or not persistent) (6A73)

6A73 Mixed depressive and anxiety disorder

Mixed depressive and anxiety disorder is characterised by symptoms of both anxiety and depression more days than not for a period of two weeks or more. Depressive symptoms include depressed mood or markedly diminished interest or pleasure in activities. There are multiple anxiety symptoms, which may include feeling nervous, anxious, or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, muscle tension, or sympathetic autonomic symptoms. Neither set of symptoms, considered separately, is sufficiently severe, numerous, or persistent to justify a diagnosis of another depressive disorder or an anxiety or fear-related disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. There is no history of manic or mixed episodes, which would indicate the presence of a bipolar disorder.

6A7Y Other specified depressive disorders

6A7Z Depressive disorders, unspecified

6A80 Symptomatic and course presentations for mood episodes in mood disorders

These categories may be applied to describe the presentation and characteristics of mood episodes in the context of single episode depressive disorder, recurrent depressive disorder, bipolar type I disorder, or bipolar type II disorder. These categories indicate the presence of specific, important features of the clinical presentation or of the course, onset, and pattern of mood episodes. These categories are not mutually exclusive, and as many may be added as apply.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

Coded Elsewhere: Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms (6E20)

Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms (6E21)

6A80.0 Prominent anxiety symptoms in mood episodes

In the context of a current depressive, manic, mixed, or hypomanic episode, prominent and clinically significant anxiety symptoms (e.g., feeling nervous, anxious or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, motor tension, autonomic symptoms) have been present for most of the time during the episode. If there have been panic attacks during a current depressive or mixed episode, these should be recorded separately.

When the diagnostic requirements for both a mood disorder and an anxiety or fear-related disorder are met, the anxiety or fear-related disorder should also be diagnosed.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

6A80.1 Panic attacks in mood episodes

In the context of a current mood episode (manic, depressive, mixed, or hypomanic), there have been recurrent panic attacks (i.e., at least two) during the past month that occur specifically in response to anxiety-provoking cognitions that are features of the mood episode. If panic attacks occur exclusively in response to such thoughts, panic attacks should be recorded using this qualifier rather than assigning an additional co-occurring diagnosis of panic disorder.

If some panic attacks over the course of the depressive or mixed episode have been unexpected and not exclusively in response to depressive or anxiety-provoking thoughts, a separate diagnosis of panic disorder should be assigned.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

Exclusions: Panic disorder (6B01)

6A80.2 Current depressive episode persistent

The diagnostic requirements for a depressive episode are currently met and have been met continuously for at least the past 2 years.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

6A80.3 Current depressive episode with melancholia

In the context of a current Depressive Episode, several of the following symptoms have been present during the worst period of the current episode: loss of interest or pleasure in most activities that are normally enjoyable to the individual (i.e., pervasive anhedonia); lack of emotional reactivity to normally pleasurable stimuli or circumstances (i.e., mood does not lift even transiently with exposure); terminal insomnia (i.e., waking in the morning two hours or more before the usual time); depressive symptoms are worse in the morning; marked psychomotor retardation or agitation; marked loss of appetite or loss of weight.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

6A80.4 Seasonal pattern of mood episode onset

In the context of recurrent depressive disorder, bipolar type I or bipolar type II disorder, there has been a regular seasonal pattern of onset and remission of at least one type of episode (i.e., depressive, manic, mixed, or hypomanic episodes), with a substantial majority of the relevant mood episodes corresponding to the seasonal pattern. (In bipolar type I and bipolar type II disorder, all types of mood episodes may not follow this pattern.) A seasonal pattern should be differentiated from an episode that is coincidental with a particular season but predominantly related to a psychological stressor that regularly occurs at that time of the year (e.g., seasonal unemployment).

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

6A80.5 **Rapid cycling**

In the context of bipolar type I or bipolar type II disorder, there has been a high frequency of mood episodes (at least four) over the past 12 months. There may be a switch from one polarity of mood to the other, or the mood episodes may be demarcated by a period of remission. In individuals with a high frequency of mood episodes, some may have a shorter duration than those usually observed in bipolar type I or bipolar type II disorder. In particular, depressive periods may only last several days. If depressive and manic symptoms alternate very rapidly (i.e., from day to day or within the same day), a mixed episode should be diagnosed rather than rapid cycling.

Coding Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

6A8Y **Other specified mood disorders**

6A8Z **Mood disorders, unspecified**

Anxiety or fear-related disorders (6B00-6B0Z)

Anxiety and fear-related disorders are characterised by excessive fear and anxiety and related behavioural disturbances, with symptoms that are severe enough to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Fear and anxiety are closely related phenomena; fear represents a reaction to perceived imminent threat in the present, whereas anxiety is more future-oriented, referring to perceived anticipated threat. A key differentiating feature among the Anxiety and fear-related disorders are disorder-specific foci of apprehension, that is, the stimulus or situation that triggers the fear or anxiety. The clinical presentation of Anxiety and fear-related disorders typically includes specific associated cognitions that can assist in differentiating among the disorders by clarifying the focus of apprehension.

Coded Elsewhere: Substance-induced anxiety disorders

Hypochondriasis (6B23)

Secondary anxiety syndrome (6E63)

6B00 **Generalised anxiety disorder**

Generalised anxiety disorder is characterised by marked symptoms of anxiety that persist for at least several months, for more days than not, manifested by either general apprehension (i.e. ‘free-floating anxiety’) or excessive worry focused on multiple everyday events, most often concerning family, health, finances, and school or work, together with additional symptoms such as muscular tension or motor restlessness, sympathetic autonomic over-activity, subjective experience of nervousness, difficulty maintaining concentration, irritability, or sleep disturbance. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another health condition and are not due to the effects of a substance or medication on the central nervous system.

6B01 **Panic disorder**

Panic disorder is characterised by recurrent unexpected panic attacks that are not restricted to particular stimuli or situations. Panic attacks are discrete episodes of intense fear or apprehension accompanied by the rapid and concurrent onset of several characteristic symptoms (e.g. palpitations or increased heart rate, sweating, trembling, shortness of breath, chest pain, dizziness or lightheadedness, chills, hot flushes, fear of imminent death). In addition, panic disorder is characterised by persistent concern about the recurrence or significance of panic attacks, or behaviours intended to avoid their recurrence, that results in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another medical condition and are not due to the effects of a substance or medication on the central nervous system.

Exclusions: Panic attack (MB23.H)

6B02 **Agoraphobia**

Agoraphobia is characterised by marked and excessive fear or anxiety that occurs in response to multiple situations where escape might be difficult or help might not be available, such as using public transportation, being in crowds, being outside the home alone (e.g., in shops, theatres, standing in line). The individual is consistently anxious about these situations due to a fear of specific negative outcomes (e.g., panic attacks, other incapacitating or embarrassing physical symptoms). The situations are actively avoided, entered only under specific circumstances such as in the presence of a trusted companion, or endured with intense fear or anxiety. The symptoms persist for least several months, and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

6B03 **Specific phobia**

Specific phobia is characterised by a marked and excessive fear or anxiety that consistently occurs upon exposure or anticipation of exposure to one or more specific objects or situations (e.g., proximity to certain animals, flying, heights, closed spaces, sight of blood or injury) that is out of proportion to actual danger. The phobic objects or situations are avoided or else endured with intense fear or anxiety. Symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

Inclusions: Simple phobia

Exclusions: Body dysmorphic disorder (6B21)

Hypochondriasis (6B23)

6B04 **Social anxiety disorder**

Social anxiety disorder is characterised by marked and excessive fear or anxiety that consistently occurs in one or more social situations such as social interactions (e.g. having a conversation), doing something while feeling observed (e.g. eating or drinking in the presence of others), or performing in front of others (e.g. giving a speech). The individual is concerned that he or she will act in a way, or show anxiety symptoms, that will be negatively evaluated by others. Relevant social situations are consistently avoided or else endured with intense fear or anxiety. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

6B05 **Separation anxiety disorder**

Separation anxiety disorder is characterised by marked and excessive fear or anxiety about separation from specific attachment figures. In children and adolescents, separation anxiety typically focuses on caregivers, parents or other family members and the fear or anxiety is beyond what would be considered developmentally normative. In adults, the focus is typically a romantic partner or children. Manifestations of separation anxiety may include thoughts of harm or untoward events befalling the attachment figure, reluctance to go to school or work, recurrent excessive distress upon separation, reluctance or refusal to sleep away from the attachment figure, and recurrent nightmares about separation. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

Exclusions: mood [affective] disorders (6A60-6A8Z)

Selective mutism (6B06)

Social anxiety disorder (6B04)

6B06 **Selective mutism**

Selective mutism is characterised by consistent selectivity in speaking, such that a child demonstrates adequate language competence in specific social situations, typically at home, but consistently fails to speak in others, typically at school. The disturbance lasts for at least one month, is not limited to the first month of school, and is of sufficient severity to interfere with educational achievement or with social communication. Failure to speak is not due to a lack of knowledge of, or comfort with, the spoken language required in the social situation (e.g. a different language spoken at school than at home).

Exclusions: Schizophrenia (6A20)

transient mutism as part of separation anxiety in young children (6B05)

Autism spectrum disorder (6A02)

6B0Y **Other specified anxiety or fear-related disorders**

6B0Z **Anxiety or fear-related disorders, unspecified**

Obsessive-compulsive or related disorders (6B20-6B2Z)

Obsessive-compulsive and related disorders is a group of disorders characterised by repetitive thoughts and behaviours that are believed to share similarities in aetiology and key diagnostic validators. Cognitive phenomena such as obsessions, intrusive thoughts and preoccupations are central to a subset of these conditions (i.e., obsessive-compulsive disorder, body dysmorphic disorder, hypochondriasis, and olfactory reference disorder) and are accompanied by related repetitive behaviours. Hoarding Disorder is not associated with intrusive unwanted thoughts but rather is characterised by a compulsive need to accumulate possessions and distress related to discarding them. Also included in the grouping are body-focused repetitive behaviour disorders, which are primarily characterised by recurrent and habitual actions directed at the integument (e.g., hair-pulling, skin-picking) and lack a prominent cognitive aspect. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

Coded Elsewhere: Substance-induced obsessive-compulsive or related disorders

Secondary obsessive-compulsive or related syndrome (6E64)

Tourette syndrome (8A05.00)

6B20 Obsessive-compulsive disorder

Obsessive-Compulsive Disorder is characterised by the presence of persistent obsessions or compulsions, or most commonly both. Obsessions are repetitive and persistent thoughts, images, or impulses/urges that are intrusive, unwanted, and are commonly associated with anxiety. The individual attempts to ignore or suppress obsessions or to neutralize them by performing compulsions. Compulsions are repetitive behaviours including repetitive mental acts that the individual feels driven to perform in response to an obsession, according to rigid rules, or to achieve a sense of 'completeness'. In order for obsessive-compulsive disorder to be diagnosed, obsessions and compulsions must be time consuming (e.g. taking more than an hour per day) or result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: anankastic neurosis

obsessive-compulsive neurosis

Exclusions: obsessive compulsive behaviour (MB23.4)

6B20.0 Obsessive-compulsive disorder with fair to good insight

All definitional requirements of obsessive-compulsive disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

6B20.1 Obsessive-compulsive disorder with poor to absent insight

All definitional requirements of obsessive-compulsive disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

6B20.Z Obsessive-compulsive disorder, unspecified

6B21 Body dysmorphic disorder

Body Dysmorphic Disorder is characterised by persistent preoccupation with one or more perceived defects or flaws in appearance that are either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the perceived defect or flaw). In response to their preoccupation, individuals engage in repetitive and excessive behaviours that include repeated examination of the appearance or severity of the perceived defect or flaw, excessive attempts to camouflage or alter the perceived defect, or marked avoidance of social situations or triggers that increase distress about the perceived defect or flaw. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions: Anorexia Nervosa (6B80)

Bodily distress disorder (6C20)

Concern about body appearance (QD30-QD3Z)

6B21.0 Body dysmorphic disorder with fair to good insight

All definitional requirements of body dysmorphic disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

6B21.1 Body dysmorphic disorder with poor to absent insight

All definitional requirements of body dysmorphic disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

6B21.Z Body dysmorphic disorder, unspecified

6B22 Olfactory reference disorder

Olfactory Reference Disorder is characterised by persistent preoccupation with the belief that one is emitting a perceived foul or offensive body odour or breath that is either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness about the perceived odour, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the odour). In response to their preoccupation, individuals engage in repetitive and excessive behaviours such as repeatedly checking for body odour or checking the perceived source of the smell, or repeatedly seeking reassurance, excessive attempts to camouflage, alter, or prevent the perceived odour, or marked avoidance of social situations or triggers that increase distress about the perceived foul or offensive odour. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B22.0 **Olfactory reference disorder with fair to good insight**

All definitional requirements of olfactory reference disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

6B22.1 **Olfactory reference disorder with poor to absent insight**

All definitional requirements of olfactory reference disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

6B22.Z **Olfactory reference disorder, unspecified**

6B23 Hypochondriasis

Hypochondriasis is characterised by persistent preoccupation or fear about the possibility of having one or more serious, progressive or life-threatening illnesses. The preoccupation is accompanied by either: 1) repetitive and excessive health-related behaviours, such as repeatedly checking of the body for evidence of illness, spending inordinate amounts of time searching for information about the feared illness, repeatedly seeking reassurance (e.g. arranging multiple medical consultations); or 2) maladaptive avoidance behaviour related to health (e.g. avoids medical appointments). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: Hypochondriacal neurosis

Illness anxiety disorder

Exclusions: Body dysmorphic disorder (6B21)

Bodily distress disorder (6C20)

Fear of cancer (MG24.0)

6B23.0 **Hypochondriasis with fair to good insight**

All definitional requirements of hypochondriasis are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

6B23.1 **Hypochondriasis with poor to absent insight**

All definitional requirements of hypochondriasis are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

6B23.Z **Hypochondriasis, unspecified**

6B24 Hoarding disorder

Hoarding disorder is characterised by accumulation of possessions that results in living spaces becoming cluttered to the point that their use or safety is compromised. Accumulation occurs due to both repetitive urges or behaviours related to amassing items and difficulty discarding possessions due to a perceived need to save items and distress associated with discarding them. If living areas are uncluttered this is only due to the intervention of third parties (e.g., family members, cleaners, authorities). Amassment may be passive (e.g. accumulation of incoming flyers or mail) or active (e.g. excessive acquisition of free, purchased, or stolen items). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B24.0 Hoarding disorder with fair to good insight

All definitional requirements of hoarding disorder are met. The individual recognizes that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are problematic. This qualifier level may still be applied if, at circumscribed times (e.g., when being forced to discard items), the individual demonstrates no insight.

6B24.1 Hoarding disorder with poor to absent insight

All definitional requirements of hoarding disorder are met. Most or all of the time, the individual is convinced that that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are not problematic, despite evidence to the contrary. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

6B24.Z Hoarding disorder, unspecified

6B25 Body-focused repetitive behaviour disorders

Body focused repetitive behaviour disorders are characterised by recurrent and habitual actions directed at the integument (e.g. hair-pulling, skin-picking, lip-biting), typically accompanied by unsuccessful attempts to decrease or stop the behaviour involved, and which lead to dermatological sequelae (e.g., hair loss, skin lesions, lip abrasions). The behaviour may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B25.0 Trichotillomania

Trichotillomania is characterised by recurrent pulling of one's own hair leading to significant hair loss, accompanied by unsuccessful attempts to decrease or stop the behaviour. Hair pulling may occur from any region of the body in which hair grows but the most common sites are the scalp, eyebrows, and eyelids. Hair pulling may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: Compulsive hair plucking

Exclusions: stereotyped movement disorder with hair-plucking (6A06)

6B25.1 Excoriation disorder

Excoriation disorder is characterised by recurrent picking of one's own skin leading to skin lesions, accompanied by unsuccessful attempts to decrease or stop the behaviour. The most commonly picked sites are the face, arms and hands, but many individuals pick from multiple body sites. Skin picking may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: skin picking disorder

Exclusions: Stereotyped movement disorder (6A06)

Acute excoriation of skin (ME62.9)

Chronic excoriation of skin (ME63.7)

6B25.Y Other specified body-focused repetitive behaviour disorders

6B25.Z Body-focused repetitive behaviour disorders, unspecified

6B2Y Other specified obsessive-compulsive or related disorders

6B2Z Obsessive-compulsive or related disorders, unspecified

Disorders specifically associated with stress (6B40-6B4Z)

Disorders specifically associated with stress are directly related to exposure to a stressful or traumatic event, or a series of such events or adverse experiences. For each of the disorders in this grouping, an identifiable stressor is a necessary, though not sufficient, causal factor. Although not all individuals exposed to an identified stressor will develop a disorder, the disorders in this grouping would not have occurred without experiencing the stressor. Stressful events for some disorders in this grouping are within the normal range of life experiences (e.g., divorce, socio-economic problems, bereavement). Other disorders require the experience of a stressor of an extremely threatening or horrific nature (i.e., potentially traumatic events). With all disorders in this grouping, it is the nature, pattern, and duration of the symptoms that arise in response to the stressful events—together with associated functional impairment—that distinguishes the disorders.

Exclusions: Burnout (QD85)

Acute stress reaction (QE84)

6B40 Post traumatic stress disorder

Post traumatic stress disorder (PTSD) may develop following exposure to an extremely threatening or horrific event or series of events. It is characterised by all of the following: 1) re-experiencing the traumatic event or events in the present in the form of vivid intrusive memories, flashbacks, or nightmares. Re-experiencing may occur via one or multiple sensory modalities and is typically accompanied by strong or overwhelming emotions, particularly fear or horror, and strong physical sensations; 2) avoidance of thoughts and memories of the event or events, or avoidance of activities, situations, or people reminiscent of the event(s); and 3) persistent perceptions of heightened current threat, for example as indicated by hypervigilance or an enhanced startle reaction to stimuli such as unexpected noises. The symptoms persist for at least several weeks and cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Inclusions: Traumatic neurosis

Exclusions: Acute stress reaction (QE84)

Complex post traumatic stress disorder (6B41)

6B41 Complex post traumatic stress disorder

Complex post traumatic stress disorder (Complex PTSD) is a disorder that may develop following exposure to an event or series of events of an extremely threatening or horrific nature, most commonly prolonged or repetitive events from which escape is difficult or impossible (e.g. torture, slavery, genocide campaigns, prolonged domestic violence, repeated childhood sexual or physical abuse). All diagnostic requirements for PTSD are met. In addition, Complex PTSD is characterised by severe and persistent 1) problems in affect regulation; 2) beliefs about oneself as diminished, defeated or worthless, accompanied by feelings of shame, guilt or failure related to the traumatic event; and 3) difficulties in sustaining relationships and in feeling close to others. These symptoms cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions: Post traumatic stress disorder (6B40)

6B42

Prolonged grief disorder

Prolonged grief disorder is a disturbance in which, following the death of a partner, parent, child, or other person close to the bereaved, there is persistent and pervasive grief response characterised by longing for the deceased or persistent preoccupation with the deceased accompanied by intense emotional pain (e.g. sadness, guilt, anger, denial, blame, difficulty accepting the death, feeling one has lost a part of one's self, an inability to experience positive mood, emotional numbness, difficulty in engaging with social or other activities). The grief response has persisted for an atypically long period of time following the loss (more than 6 months at a minimum) and clearly exceeds expected social, cultural or religious norms for the individual's culture and context. Grief reactions that have persisted for longer periods that are within a normative period of grieving given the person's cultural and religious context are viewed as normal bereavement responses and are not assigned a diagnosis. The disturbance causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B43

Adjustment disorder

Adjustment disorder is a maladaptive reaction to an identifiable psychosocial stressor or multiple stressors (e.g. divorce, illness or disability, socio-economic problems, conflicts at home or work) that usually emerges within a month of the stressor. The disorder is characterised by preoccupation with the stressor or its consequences, including excessive worry, recurrent and distressing thoughts about the stressor, or constant rumination about its implications, as well as by failure to adapt to the stressor that causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The symptoms are not better explained by another mental disorder (e.g., Mood Disorder, another Disorder Specifically Associated with Stress) and typically resolve within 6 months, unless the stressor persists for a longer duration.

Exclusions: separation anxiety disorder of childhood (6B05)

Recurrent depressive disorder (6A71)

Single episode depressive disorder (6A70)

Prolonged grief disorder (6B42)

Uncomplicated bereavement (QE62)

Burnout (QD85)

Acute stress reaction (QE84)

6B44 **Reactive attachment disorder**

Reactive attachment disorder is characterised by grossly abnormal attachment behaviours in early childhood, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, maltreatment, institutional deprivation). Even when an adequate primary caregiver is newly available, the child does not turn to the primary caregiver for comfort, support and nurture, rarely displays security-seeking behaviours towards any adult, and does not respond when comfort is offered. Reactive attachment disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

Exclusions: Asperger syndrome (6A02)

disinhibited attachment disorder of childhood (6B45)

6B45 **Disinhibited social engagement disorder**

Disinhibited social engagement disorder is characterised by grossly abnormal social behaviour, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, institutional deprivation). The child approaches adults indiscriminately, lacks reticence to approach, will go away with unfamiliar adults, and exhibits overly familiar behaviour towards strangers. Disinhibited social engagement disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

Exclusions: Asperger syndrome (6A02)

Adjustment disorder (6B43)

Attention deficit hyperactivity disorder (6A05)

reactive attachment disorder of childhood (6B44)

6B4Y **Other specified disorders specifically associated with stress**

6B4Z **Disorders specifically associated with stress, unspecified**

Dissociative disorders (6B60-6B6Z)

Dissociative disorders are characterised by involuntary disruption or discontinuity in the normal integration of one or more of the following: identity, sensations, perceptions, affects, thoughts, memories, control over bodily movements, or behaviour. Disruption or discontinuity may be complete, but is more commonly partial, and can vary from day to day or even from hour to hour. The symptoms of dissociative disorders are not due the direct effects of a medication or substance, including withdrawal effects, are not better explained by another Mental, behavioural, or neurodevelopmental disorder, a Sleep-wake disorder, a Disease of the nervous system or other health condition, and are not part of an accepted cultural, religious, or spiritual practice. Dissociative symptoms in dissociative disorders are sufficiently severe to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Coded Elsewhere: Secondary dissociative syndrome (6E65)

6B60 **Dissociative neurological symptom disorder**

Dissociative neurological symptom disorder is characterised by the presentation of motor, sensory, or cognitive symptoms that imply an involuntary discontinuity in the normal integration of motor, sensory, or cognitive functions and are not consistent with a recognised disease of the nervous system, other mental or behavioural disorder, or other medical condition. The symptoms do not occur exclusively during another dissociative disorder and are not due to the effects of a substance or medication on the central nervous system, including withdrawal effects, or a Sleep-Wake disorder.

Exclusions: Factitious disorders (6D50-6D5Z)

6B60.0 Dissociative neurological symptom disorder, with visual disturbance

Dissociative neurological symptom disorder, with visual disturbance is characterised by visual symptoms such as blindness, tunnel vision, diplopia, visual distortions or hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.1 Dissociative neurological symptom disorder, with auditory disturbance

Dissociative neurological symptom disorder, with auditory disturbance is characterised by auditory symptoms such as loss of hearing or auditory hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.2 Dissociative neurological symptom disorder, with vertigo or dizziness

Dissociative neurological symptom disorder, with vertigo or dizziness is characterised by a sensation of spinning while stationary (vertigo) or dizziness that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

6B60.3 Dissociative neurological symptom disorder, with other sensory disturbance

Dissociative neurological symptom disorder, with other sensory disturbance is characterised by sensory symptoms not identified in other specific categories in this grouping such as numbness, tightness, tingling, burning, pain, or other symptoms related to touch, smell, taste, balance, proprioception, kinesthesia, or thermoception. The symptoms are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.4 Dissociative neurological symptom disorder, with non-epileptic seizures

Dissociative neurological symptom disorder, with non-epileptic seizures is characterised by a symptomatic presentation of seizures or convulsions that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.5 Dissociative neurological symptom disorder, with speech disturbance

Dissociative neurological symptom disorder, with speech disturbance is characterised by symptoms such as difficulty with speaking (dysphonia), loss of the ability to speak (aphonia) or difficult or unclear articulation of speech (dysarthria) that are not consistent with a recognised disease of the nervous system, a neurodevelopmental or neurocognitive disorder, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.6 Dissociative neurological symptom disorder, with paresis or weakness

Dissociative neurological symptom disorder, with paresis or weakness is characterised by a difficulty or inability to intentionally move parts of the body or to coordinate movements that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

6B60.7 Dissociative neurological symptom disorder, with gait disturbance

Dissociative neurological symptom disorder, with gait disturbance is characterised by symptoms involving the individual's ability or manner of walking, including ataxia and the inability to stand unaided, that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.8 Dissociative neurological symptom disorder, with movement disturbance

Dissociative neurological symptom disorder, with movement disturbance is characterised by symptoms such as chorea, myoclonus, tremor, dystonia, facial spasm, parkinsonism, or dyskinesia that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.80 Dissociative neurological symptom disorder, with chorea

Dissociative neurological symptom disorder, with chorea is characterised by irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.81 Dissociative neurological symptom disorder, with myoclonus

Dissociative neurological symptom disorder, with myoclonus is characterised by sudden rapid jerks that may be focal, multifocal or generalised that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.82 Dissociative neurological symptom disorder, with tremor

Dissociative neurological symptom disorder, with tremor is characterised by involuntary oscillation of a body part that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

6B60.83 Dissociative neurological symptom disorder, with dystonia

Dissociative neurological symptom disorder, with dystonia is characterised by sustained muscle contractions that frequently causing twisting and repetitive movements or abnormal postures that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

6B60.84 Dissociative neurological symptom disorder, with facial spasm

Dissociative neurological symptom disorder, with facial spasm is characterised by involuntary muscle contractions or twitching of the face that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

6B60.85 Dissociative neurological symptom disorder, with Parkinsonism

Dissociative neurological symptom disorder, with Parkinsonism is characterised by a symptomatic presentation of a Parkinson-like syndrome in the absence of confirmed Parkinson disease that does not occur exclusively during another mental, behavioural or neurodevelopmental disorder, other medical condition, or another dissociative disorder. Dissociative neurological symptom disorder, with Parkinsonism can be distinguished from Parkinson disease by features such as abrupt onset, early disability, bilateral shaking and slowness, nondecremental slowness when performing repetitive movements, voluntary resistance against passive movement without cogwheel rigidity, distractability, ‘give-way’ weakness, stuttering speech, bizarre gait, and a variety of behavioural symptoms.

6B60.8Y Dissociative neurological symptom disorder, with other specified movement disturbance

6B60.8Z Dissociative neurological symptom disorder, with unspecified movement disturbance

6B60.9 Dissociative neurological symptom disorder, with cognitive symptoms

Dissociative neurological symptom disorder, with cognitive symptoms is characterised by impaired cognitive performance in memory, language or other cognitive domains that is internally inconsistent and not consistent with a recognised disease of the nervous system, a neurodevelopmental or neurocognitive disorder, other mental, behavioural or neurodevelopmental disorder, or another medical condition and does not occur exclusively during another dissociative disorder.

Exclusions: Dissociative amnesia (6B61)

6B60.Y Dissociative neurological symptom disorder, with other specified symptoms

6B60.Z Dissociative neurological symptom disorder, with unspecified symptoms

6B61 Dissociative amnesia

Dissociative amnesia is characterised by an inability to recall important autobiographical memories, typically of recent traumatic or stressful events, that is inconsistent with ordinary forgetting. The amnesia does not occur exclusively during another dissociative disorder and is not better explained by another mental, behavioural or neurodevelopmental disorder. The amnesia is not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and is not due to a disease of the nervous system or to head trauma. The amnesia results in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions: amnesia NOS (MB21.1)

Amnestic disorder due to use of alcohol (6D72.10)

Anterograde amnesia (MB21.10)

Retrograde amnesia (MB21.11)

nonalcoholic organic amnesic syndrome (6D72.0)

postictal amnesia in epilepsy (8A60-8A6Z)

6B61.0 Dissociative amnesia with dissociative fugue

Dissociative amnesia with dissociative fugue is characterised by all of the features of Dissociative Amnesia, accompanied by dissociative fugue, i.e., a loss of a sense of personal identity and sudden travel away from home, work, or significant others for an extended period of time (days or weeks). A new identity may be assumed.

Exclusions: postictal fugue in epilepsy (8A60-8A6Z)

6B61.1 Dissociative amnesia without dissociative fugue

Dissociative amnesia without dissociative fugue is characterised by all of the features of dissociative amnesia occurring in the absence of symptoms of dissociative fugue.

6B61.Z Dissociative amnesia, unspecified

6B62

Trance disorder

Trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness or a loss of the individual's customary sense of personal identity in which the individual experiences a narrowing of awareness of immediate surroundings or unusually narrow and selective focusing on environmental stimuli and restriction of movements, postures, and speech to repetition of a small repertoire that is experienced as being outside of one's control. The trance state is not characterised by the experience of being replaced by an alternate identity. Trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system, head trauma, or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B63

Possession trance disorder

Possession trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness and the individual's customary sense of personal identity is replaced by an external 'possessing' identity and in which the individual's behaviours or movements are experienced as being controlled by the possessing agent. Possession trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The possession trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions:

Schizophrenia (6A20)

Disorders due to use of other specified psychoactive substances, including medications (6C4E)

Acute and transient psychotic disorder (6A23)

Secondary personality change (6E68)

6B64

Dissociative identity disorder

Dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. At least two distinct personality states recurrently take executive control of the individual's consciousness and functioning in interacting with others or with the environment, such as in the performance of specific aspects of daily life such as parenting, or work, or in response to specific situations (e.g., those that are perceived as threatening). Changes in personality state are accompanied by related alterations in sensation, perception, affect, cognition, memory, motor control, and behaviour. There are typically episodes of amnesia, which may be severe. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B65

Partial dissociative identity disorder

Partial dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. One personality state is dominant and normally functions in daily life, but is intruded upon by one or more non-dominant personality states (dissociative intrusions). These intrusions may be cognitive, affective, perceptual, motor, or behavioural. They are experienced as interfering with the functioning of the dominant personality state and are typically aversive. The non-dominant personality states do not recurrently take executive control of the individual's consciousness and functioning, but there may be occasional, limited and transient episodes in which a distinct personality state assumes executive control to engage in circumscribed behaviours, such as in response to extreme emotional states or during episodes of self-harm or the reenactment of traumatic memories. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B66 **Depersonalization-derealization disorder**

Depersonalization-derealization disorder is characterised by persistent or recurrent experiences of depersonalization, derealization, or both. Depersonalization is characterised by experiencing the self as strange or unreal, or feeling detached from, or as though one were an outside observer of, one's thoughts, feelings, sensations, body, or actions. Derealization is characterised by experiencing other persons, objects, or the world as strange or unreal (e.g., dreamlike, distant, foggy, lifeless, colourless, or visually distorted) or feeling detached from one's surroundings. During experiences of depersonalization or derealization, reality testing remains intact. The experiences of depersonalization or derealization do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The experiences of depersonalization or derealization are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or to head trauma. The symptoms result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B6Y **Other specified dissociative disorders**

6B6Z **Dissociative disorders, unspecified**

Feeding or eating disorders (6B80-6B8Z)

Feeding and Eating Disorders involve abnormal eating or feeding behaviours that are not explained by another health condition and are not developmentally appropriate or culturally sanctioned. Feeding disorders involve behavioural disturbances that are not related to body weight and shape concerns, such as eating of non-edible substances or voluntary regurgitation of foods. Eating disorders involve abnormal eating behaviour and preoccupation with food as well as prominent body weight and shape concerns.

6B80 **Anorexia Nervosa**

Anorexia Nervosa is characterised by significantly low body weight for the individual's height, age and developmental stage that is not due to another health condition or to the unavailability of food. A commonly used threshold is body mass index (BMI) less than 18.5 kg/m2 in adults and BMI-for-age under 5th percentile in children and adolescents. Rapid weight loss (e.g. more than 20% of total body weight within 6 months) may replace the low body weight guideline as long as other diagnostic requirements are met. Children and adolescents may exhibit failure to gain weight as expected based on the individual developmental trajectory rather than weight loss. Low body weight is accompanied by a persistent pattern of behaviours to prevent restoration of normal weight, which may include behaviours aimed at reducing energy intake (restricted eating), purging behaviours (e.g. self-induced vomiting, misuse of laxatives), and behaviours aimed at increasing energy expenditure (e.g. excessive exercise), typically associated with a fear of weight gain. Low body weight or shape is central to the person's self-evaluation or is inaccurately perceived to be normal or even excessive.

6B80.0 **Anorexia Nervosa with significantly low body weight**

Anorexia Nervosa with significantly low body weight meets all definitional requirements for Anorexia Nervosa, with BMI between 18.5 kg/m2 and 14.0 kg/m² for adults or between the fifth percentile and the 0.3 percentile for BMI-for-age in children and adolescents).

6B80.00 Anorexia Nervosa with significantly low body weight, restricting pattern

Anorexia Nervosa with significantly low body weight, restricting pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with significantly low body weight and who induce weight loss and maintain low body weight through restricted food intake or fasting alone or in combination with increased energy expenditure (such as through excessive exercise) but who do not engage in binge eating or purging behaviours.

6B80.01 Anorexia Nervosa with significantly low body weight, binge-purge pattern

Anorexia Nervosa with significantly low body weight, binge-purge pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with significantly low body weight and who present with episodes of binge eating or purging behaviours. These individuals induce weight loss and maintain low body weight through restricted food intake, commonly accompanied by significant purging behaviours aimed at getting rid of ingested food (e.g. self-induced vomiting, laxative abuse or enemas). This pattern also includes individuals who exhibit binge eating episodes but do not purge.

6B80.0Z Anorexia Nervosa with significantly low body weight, unspecified

6B80.1 **Anorexia Nervosa with dangerously low body weight**

Anorexia Nervosa with dangerously low body weight meets all definitional requirements for Anorexia Nervosa, with BMI under 14.0 kg/m² in adults or under the 0.3rd percentile for BMI-for-age in children and adolescents. In the context of Anorexia Nervosa, severe underweight status is an important prognostic factor that is associated with high risk of physical complications and substantially increased mortality.

6B80.10 Anorexia Nervosa with dangerously low body weight, restricting pattern

Anorexia Nervosa with dangerously low body weight, restricting pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with dangerously low body weight and who induce weight loss and maintain low body weight through restricted food intake or fasting alone or in combination with increased energy expenditure (such as through excessive exercise) but who do not engage in binge eating or purging behaviours.

6B80.11 Anorexia Nervosa with dangerously low body weight, binge-purge pattern

Anorexia Nervosa with dangerously low body weight, binge-purge pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with dangerously low body weight and who present with episodes of binge eating or purging behaviours. These individuals induce weight loss and maintain low body weight through restricted food intake, commonly accompanied by significant purging behaviours aimed at getting rid of ingested food (e.g. self-induced vomiting, laxative abuse or enemas). This pattern also includes individuals who exhibit binge eating episodes but do not purge.

6B80.1Z Anorexia Nervosa with dangerously low body weight, unspecified

6B80.2 **Anorexia Nervosa in recovery with normal body weight**

Among individuals who are recovering from Anorexia Nervosa and whose body weight is more than 18.5 kg/m2 for adults or over the fifth percentile for BMI-for-age for children and adolescents, the diagnosis should be retained until a full and lasting recovery is achieved, as indicated by the maintenance of a healthy weight and the cessation of behaviours aimed at reducing body weight independent of the provision of treatment (e.g., for at least 1 year after intensive treatment is withdrawn).

6B80.Y **Other specified anorexia Nervosa**

6B80.Z **Anorexia Nervosa, unspecified**

6B81 Bulimia Nervosa

Bulimia Nervosa is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of at least one month). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is accompanied by repeated inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). The individual is preoccupied with body shape or weight, which strongly influences self-evaluation. There is marked distress about the pattern of binge eating and inappropriate compensatory behaviour or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The individual does not meet the diagnostic requirements of Anorexia Nervosa.

Exclusions: Binge eating disorder (6B82)

6B82 Binge eating disorder

Binge eating disorder is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of several months). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is experienced as very distressing, and is often accompanied by negative emotions such as guilt or disgust. However, unlike in Bulimia Nervosa, binge eating episodes are not regularly followed by inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). There is marked distress about the pattern of binge eating or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions: Bulimia Nervosa (6B81)

6B83 **Avoidant-restrictive food intake disorder**

Avoidant-restrictive food intake disorder (ARFID) is characterised by avoidance or restriction of food intake that results in: 1) the intake of an insufficient quantity or variety of food to meet adequate energy or nutritional requirements that has resulted in significant weight loss, clinically significant nutritional deficiencies, dependence on oral nutritional supplements or tube feeding, or has otherwise negatively affected the physical health of the individual; or 2) significant impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g.,due to avoidance or distress related to participating in social experiences involving eating). The pattern of eating behaviour is not motivated by preoccupation with body weight or shape. Restricted food intake and its effects on weight, other aspects of health, or functioning is not due to unavailability of food, not a manifestation of another medical condition (e.g. food allergies, hyperthyroidism) or mental disorder, and are not due to the effect of a substance or medication on the central nervous system including withdrawal effects.

Exclusions: Anorexia Nervosa (6B80)

Feeding problem of infant (MG43.30)

Feeding problems of newborn (KD32)

6B84 **Pica**

Pica is characterised by the regular consumption of non-nutritive substances, such as non-food objects and materials (e.g., clay, soil, chalk, plaster, plastic, metal and paper) or raw food ingredients (e.g., large quantities of salt or corn flour) that is persistent or severe enough to require clinical attention in an individual who has reached a developmental age at which they would be expected to distinguish between edible and non-edible substances (approximately 2 years). That is, the behaviour causes damage to health, impairment in functioning, or significant risk due to the frequency, amount or nature of the substances or objects ingested.

6B85 **Rumination-regurgitation disorder**

Rumination-regurgitation disorder is characterised by the intentional and repeated bringing up of previously swallowed food back to the mouth (i.e., regurgitation), which may be re-chewed and re-swallowed (i.e. rumination), or may be deliberately spat out (but not as in vomiting). The regurgitation behaviour is frequent (at least several times per week) and sustained over a period of at least several weeks. The regurgitation behaviour is not fully accounted for by another medical condition that directly causes regurgitation (e.g., oesophageal strictures or neuromuscular disorders affecting oesophageal functioning) or causes nausea or vomiting (e.g. pyloric stenosis). Rumination-regurgitation disorder should only be diagnosed in individuals who have reached a developmental age of at least 2 years.

Exclusions: Adult rumination syndrome (DD90.6)

Nausea or vomiting (MD90)

6B8Y **Other specified feeding or eating disorders**

6B8Z **Feeding or eating disorders, unspecified**

Elimination disorders (6C00-6C0Z)

Elimination disorders include the repeated voiding of urine into clothes or bed (enuresis) and the repeated passage of faeces in inappropriate places (encopresis). Elimination disorders should only be diagnosed after the individual has reached a developmental age when continence is ordinarily expected (5 years for enuresis and 4 years for encopresis). The urinary or faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder or bowel control. An Elimination disorder should not be diagnosed if the behaviour is fully attributable to another health condition that causes incontinence, congenital or acquired abnormalities of the urinary tract or bowel, or excessive use of laxatives or diuretics.

6C00 Enuresis

Enuresis is the repeated voiding of urine into clothes or bed, which may occur during the day or at night, in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional. Enuresis should not be diagnosed if unintentional voiding of urine is due to a health condition that interferes with continence (e.g., diseases of the nervous system or musculoskeletal disorders) or by congenital or acquired abnormalities of the urinary tract.

Inclusions:
- Functional enuresis
- Psychogenic enuresis
- Urinary incontinence of nonorganic origin

Exclusions:
- Stress incontinence (MF50.20)
- Urge Incontinence (MF50.21)
- Functional urinary incontinence (MF50.23)
- Overflow Incontinence (MF50.2)
- Reflex incontinence (MF50.24)
- Extraurethral urinary incontinence (MF50.2)

6C00.0 Nocturnal enuresis

Nocturnal enuresis refers to repeated voiding of urine into clothes or bed that occurs only during sleep (i.e., during the night) in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

6C00.1 Diurnal enuresis

Diurnal enuresis refers to repeated voiding of urine into clothes that occurs only during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

6C00.2 **Nocturnal and diurnal enuresis**

Nocturnal and diurnal enuresis refers to repeated voiding of urine into clothes or bed that occurs both during sleep (i.e., during the night) and during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

6C00.Z **Enuresis, unspecified**

6C01 Encopresis

Encopresis is the repeated passage of faeces in inappropriate places. Encopresis should be diagnosed if inappropriate passage of faeces occurs repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis should not be diagnosed if faecal soiling is fully attributable to another health condition (e.g., aganglionic megacolon, spina bifida, dementia), congenital or acquired abnormalities of the bowel, gastrointestinal infection, or excessive use of laxatives.

6C01.0 **Encopresis with constipation or overflow incontinence**

Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis with constipation and overflow incontinence is the most common form of faecal soiling, and involves retention and impaction of faeces. Stools are typically— but not always— poorly formed (loose or liquid) and leakage may range from occasional to continuous. There is often a history of toilet avoidance leading to constipation.

6C01.1 **Encopresis without constipation or overflow incontinence**

Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis without constipation and overflow is not associated with retention and impaction of faeces, but rather reflects reluctance, resistance or failure to conform to social norms in defecating in acceptable places in the context of normal physiological control over defecation. Stools are typically of normal consistency and inappropriate defecation is likely to be intermittent.

6C01.Z **Encopresis, unspecified**

6C0Z Elimination disorders, unspecified

Disorders of bodily distress or bodily experience (6C20-6C2Z)

Disorders of bodily distress and bodily experience are characterised by disturbances in the person's experience of his or her body. Bodily distress disorder involves bodily symptoms that the individual finds distressing and to which excessive attention is directed. Body integrity dysphoria involves a disturbance in the person's experience of the body manifested by the persistent desire to have a specific physical disability accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration.

Exclusions: Dissociative neurological symptom disorder (6B60)

Concern about body appearance (QD30-QD3Z)

6C20 Bodily distress disorder

Bodily distress disorder is characterised by the presence of bodily symptoms that are distressing to the individual and excessive attention directed toward the symptoms, which may be manifest by repeated contact with health care providers. If another health condition is causing or contributing to the symptoms, the degree of attention is clearly excessive in relation to its nature and progression. Excessive attention is not alleviated by appropriate clinical examination and investigations and appropriate reassurance. Bodily symptoms are persistent, being present on most days for at least several months. Typically, bodily distress disorder involves multiple bodily symptoms that may vary over time. Occasionally there is a single symptom—usually pain or fatigue—that is associated with the other features of the disorder. The symptoms and associated distress and preoccupation have at least some impact on the individual's functioning (e.g. strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities).

Exclusions: Tourette syndrome (8A05.00)

Hair pulling disorder (6B25.0)

Dissociative disorders (6B60-6B6Z)

hair-plucking (6B25.0)

Hypochondriasis (6B23)

Body dysmorphic disorder (6B21)

Excoriation disorder (6B25.1)

Gender incongruence (HA60-HA6Z)

Sexual dysfunctions (HA00-HA0Z)

Tic disorders (8A05)

Sexual pain-penetration disorder (HA20)

Postviral fatigue syndrome (8E49)

Chronic fatigue syndrome (8E49)

Myalgic encephalomyelitis (8E49)

6C20.0 Mild bodily distress disorder

All definitional requirements of bodily distress disorder are present. There is excessive attention to distressing symptoms and their consequences, which may result in frequent medical visits, but the person is not preoccupied with the symptoms (e.g., the individual spends less than an hour per day focusing on them). Although the individual expresses distress about the symptoms and they may have some impact on his or her life (e.g., strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities), there is no substantial impairment in the person's personal, family, social, educational, occupational, or other important areas of functioning.

6C20.1 Moderate bodily distress disorder

All definitional requirements of bodily distress disorder are present. There is persistent preoccupation with the distressing symptoms and their consequences (e.g., the individual spends more than an hour a day thinking about them), typically associated with frequent medical visits. The person devotes much of his or her energy to focusing on the symptoms and their consequences. The symptoms and associated distress and preoccupation cause moderate impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., relationship conflict, performance problems at work, abandonment of a range of social and leisure activities).

6C20.2 Severe bodily distress disorder

All definitional requirements of Bodily distress disorder are present. There is pervasive and persistent preoccupation with the symptoms and their consequences to the extent that these may become the focal point of the person's life, typically resulting in extensive interactions with the health care system. The symptoms and associated distress and preoccupation cause serious impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., unable to work, alienation of friends and family, abandonment of nearly all social and leisure activities). The person's interests may become so narrow so as to focus almost exclusively on his or her bodily symptoms and their negative consequences.

6C20.Z Bodily distress disorder, unspecified

6C21 Body integrity dysphoria

Body integrity dysphoria is characterised by an intense and persistent desire to become physically disabled in a significant way (e.g. major limb amputee, paraplegic, blind), with onset by early adolescence accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration. The desire to become physically disabled results in harmful consequences, as manifested by either the preoccupation with the desire (including time spent pretending to be disabled) significantly interfering with productivity, with leisure activities, or with social functioning (e.g. person is unwilling to have a close relationships because it would make it difficult to pretend) or by attempts to actually become disabled have resulted in the person putting his or her health or life in significant jeopardy. The disturbance is not better accounted for by another mental, behavioural or neurodevelopmental disorder, by a Disease of the Nervous System or by another medical condition, or by Malingering.

Exclusions: Gender incongruence of adolescence or adulthood (HA60)

6C2Y **Other specified disorders of bodily distress or bodily experience**

6C2Z **Disorders of bodily distress or bodily experience, unspecified**

Disorders due to substance use or addictive behaviours (6C40-6C5Z)

Disorders due to substance use and addictive behaviours are mental and behavioural disorders that develop as a result of the use of predominantly psychoactive substances, including medications, or specific repetitive rewarding and reinforcing behaviours.

Disorders due to substance use (6C40-6C4Z)

Disorders due to substance use include disorders that result from a single occasion or repeated use of substances that have psychoactive properties, including certain medications. Disorders related to fourteen classes or groups of psychoactive substances are included. Typically, initial use of these substances produces pleasant or appealing psychoactive effects that are rewarding and reinforcing with repeated use. With continued use, many of the included substances have the capacity to produce dependence. They also have the potential to cause numerous forms of harm, both to mental and physical health. Disorders due to harmful non-medical use of non-psychoactive substances are also included in this grouping.

Coded Elsewhere: Catatonia induced by substances or medications (6A41)

6C40 **Disorders due to use of alcohol**

Disorders due to use of alcohol are characterised by the pattern and consequences of alcohol use. Alcohol—more specifically termed ethyl alcohol or ethanol—is an intoxicating compound produced by fermentation of sugars usually in agricultural products such as fruits, cereals, and vegetables with or without subsequent distillation. There are a wide variety of alcoholic drinks, with alcohol concentrations typically ranging from 1.5% to 60%. Alcohol is predominantly a central nervous system depressant. In addition to ability to produce Alcohol Intoxication, alcohol has dependence-producing properties, resulting in Alcohol Dependence in some people and Alcohol Withdrawal when alcohol use is reduced or discontinued. Unlike most other substances, elimination of alcohol from the body occurs at a constant rate, such that its clearance follows a linear rather than a logarithmic course. Alcohol is implicated in a wide range of harms affecting most organs and systems of the body (e.g., cirrhosis of the liver, gastrointestinal cancers, pancreatitis). Harm to others resulting from behaviour during Alcohol Intoxication is well recognized and is included in the definitions of harmful use of alcohol (i.e., Episode of Harmful Use of Alcohol and Harmful Pattern of Use of Alcohol). Several alcohol-induced mental disorders (e.g., Alcohol-Induced Psychotic Disorder) and alcohol-related forms of neurocognitive impairment (e.g., Dementia Due to Use of Alcohol) are recognized.

Exclusions: Hazardous alcohol use (QE10)

6C40.0 **Episode of harmful use of alcohol**

An episode of use of alcohol that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to alcohol intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of alcohol use.

Exclusions: Harmful pattern of use of alcohol (6C40.1)

Alcohol dependence (6C40.2)

6C40.1 **Harmful pattern of use of alcohol**

A pattern of alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of alcohol use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.

Exclusions: Alcohol dependence (6C40.2)

Episode of harmful use of alcohol (6C40.0)

6C40.10 Harmful pattern of use of alcohol, episodic

A pattern of episodic or intermittent alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic alcohol use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Alcohol dependence (6C40.2)

6C40.11 Harmful pattern of use of alcohol, continuous

A pattern of continuous (daily or almost daily) alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous alcohol use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Alcohol dependence (6C40.2)

6C40.1Z Harmful pattern of use of alcohol, unspecified

6C40.2 Alcohol dependence

Alcohol dependence is a disorder of regulation of alcohol use arising from repeated or continuous use of alcohol. The characteristic feature is a strong internal drive to use alcohol, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use alcohol. Physiological features of dependence may also be present, including tolerance to the effects of alcohol, withdrawal symptoms following cessation or reduction in use of alcohol, or repeated use of alcohol or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if alcohol use is continuous (daily or almost daily) for at least 3 months.

Inclusions: Chronic alcoholism

Dipsomania

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.20 Alcohol dependence, current use, continuous

Alcohol dependence with continuous consumption of alcohol (daily or almost daily) over a period of at least 1 month.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.21 Alcohol dependence, current use, episodic

During the past 12 months, there has been alcohol dependence with intermittent heavy drinking, with periods of abstinence from alcohol. If current use is continuous (daily or almost daily over at least the past 1 month), the diagnosis of Alcohol dependence, current use, continuous should be made instead.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.22 Alcohol dependence, early full remission

After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from alcohol during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.23 Alcohol dependence, sustained partial remission

After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in alcohol consumption for more than 12 months, such that even though intermittent or continuing drinking has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.24 Alcohol dependence, sustained full remission

After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from alcohol for 12 months or longer.

Exclusions: Episode of harmful use of alcohol (6C40.0)

Harmful pattern of use of alcohol (6C40.1)

6C40.2Z Alcohol dependence, unspecified

6C40.3 Alcohol intoxication

Alcohol intoxication is a clinically significant transient condition that develops during or shortly after the consumption of alcohol that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of alcohol and their intensity is closely related to the amount of alcohol consumed. They are time-limited and abate as alcohol is cleared from the body. Presenting features may include impaired attention, inappropriate or aggressive behaviour, lability of mood and emotions, impaired judgment, poor coordination, unsteady gait, fine nystagmus and slurred speech. At more severe levels of intoxication, stupor or coma may occur. Alcohol intoxication may facilitate suicidal ideation or behaviour.

Coding Note: Code also the causing condition

Exclusions: alcohol poisoning (NE61)

Possession trance disorder (6B63)

6C40.4 **Alcohol withdrawal**

Alcohol withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of alcohol in individuals who have developed Alcohol dependence or have used alcohol for a prolonged period or in large amounts. Presenting features of Alcohol withdrawal may include autonomic hyperactivity (e.g. tachycardia, hypertension, perspiration), increased hand tremor, nausea, retching or vomiting, insomnia, anxiety, psychomotor agitation, depressed or dysphoric mood, transient visual, tactile or auditory illusions or hallucinations, and distractability. Less commonly, the withdrawal state is complicated by generalised tonic-clonic seizures. The withdrawal state may progress to a very severe form of delirium characterised by confusion and disorientation, delusions, and prolonged visual, tactile or auditory hallucinations. In such cases, a separate diagnosis of Alcohol-induced delirium should also be assigned.

Coding Note: Code also the causing condition

6C40.40 Alcohol withdrawal, uncomplicated

All diagnostic requirements for Alcohol Withdrawal are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.

Coding Note: Code also the causing condition

6C40.41 Alcohol withdrawal with perceptual disturbances

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.

Coding Note: Code also the causing condition

6C40.42 Alcohol withdrawal with seizures

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.

Coding Note: Code also the causing condition

6C40.43 Alcohol withdrawal with perceptual disturbances and seizures

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by both seizures (i.e., generalised tonic-clonic seizures) and perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. Diagnostic requirements for Delirium are not met.

Coding Note: Code also the causing condition

6C40.4Z Alcohol withdrawal, unspecified

Coding Note: Code also the causing condition

6C40.5 **Alcohol-induced delirium**

Alcohol-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of alcohol. The amount and duration of alcohol use must be capable of producing delirium. Specific features of alcohol-induced delirium may include impaired consciousness with disorientation, vivid hallucinations and illusions, insomnia, delusions, agitation, disturbances of attention, and accompanying tremor and physiological symptoms of alcohol withdrawal. In some cases of alcohol withdrawal, the withdrawal state may progress to a very severe form of Alcohol-induced delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

Inclusions: Delirium tremens (alcohol-induced)

Delirium induced by alcohol withdrawal

6C40.6 **Alcohol-induced psychotic disorder**

Alcohol-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with alcohol use).

Coding Note: Code also the causing condition

6C40.60 Alcohol-induced psychotic disorder with hallucinations

Alcohol-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of alcohol use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C40.61 Alcohol-induced psychotic disorder with delusions

Alcohol-induced psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of alcohol use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C40.62 Alcohol-induced psychotic disorder with mixed psychotic symptoms

Alcohol-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of alcohol use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C40.6Z Alcohol-induced psychotic disorder, unspecified

Coding Note: Code also the causing condition

6C40.7 **Certain specified alcohol-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

Coded Elsewhere: Amnestic disorder due to use of alcohol (6D72.10)

Dementia due to use of alcohol (6D84.0)

6C40.70 Alcohol-induced mood disorder

Alcohol-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with alcohol use).

Coding Note: Code also the causing condition

6C40.71 Alcohol-induced anxiety disorder

Alcohol-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with alcohol use).

Coding Note: Code also the causing condition

6C40.Y **Other specified disorders due to use of alcohol**

6C40.Z **Disorders due to use of alcohol, unspecified**

6C41 Disorders due to use of cannabis

Disorders due to use of cannabis are characterised by the pattern and consequences of cannabis use. Cannabis is the collective term for a range of psychoactive preparations of the cannabis plant, Cannabis sativa, and related species and hybrids. Cannabis contains cannabinoids, a class of diverse chemical compounds that act on endogenous cannabinoid receptors that modulate neurotransmitter release in the brain. The principal psychoactive cannabinoid is δ-9-tetrahydrocannabinol (THC). Cannabis is typically smoked in the form of the flowering heads or leaves of the marijuana plant; tobacco is often mixed with cannabis when smoked. There are also cannabis oils that are prepared from these same sources. These preparations vary considerably in their THC potency. Cannabis has predominantly central nervous system depressant effects and produces a characteristic euphoria that may be part of the presenting features of Cannabis Intoxication, which may also include impairment in cognitive and psychomotor functioning. Cannabis has dependence-producing properties resulting in Cannabis Dependence in some people and Cannabis Withdrawal when use is reduced or discontinued. Cannabis is associated with a range of Cannabis-Induced Mental Disorders.

Exclusions: Disorders due to use of synthetic cannabinoids (6C42)

Hazardous use of cannabis (QE11.1)

6C41.0 Episode of harmful use of cannabis

An episode of use of cannabis that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cannabis intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cannabis use.

Exclusions: Cannabis dependence (6C41.2)

Harmful pattern of use of cannabis (6C41.1)

6C41.1 Harmful pattern of use of cannabis

A pattern of cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cannabis use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.

Exclusions: Cannabis dependence (6C41.2)

Episode of harmful use of cannabis (6C41.0)

6C41.10 Harmful pattern of use of cannabis, episodic

A pattern of episodic or intermittent cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic cannabis use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Cannabis dependence (6C41.2)

6C41.11 Harmful pattern of use of cannabis, continuous

A pattern of continuous (daily or almost daily) cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous cannabis use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Cannabis dependence (6C41.2)

6C41.1Z Harmful pattern of use of cannabis, unspecified

6C41.2 Cannabis dependence

Cannabis dependence is a disorder of regulation of cannabis use arising from repeated or continuous use of cannabis. The characteristic feature is a strong internal drive to use cannabis, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use cannabis. Physiological features of dependence may also be present, including tolerance to the effects of cannabis, withdrawal symptoms following cessation or reduction in use of cannabis, or repeated use of cannabis or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if cannabis use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Harmful pattern of use of cannabis (6C41.1)

6C41.20 Cannabis dependence, current use

Current cannabis dependence with use of cannabis within the past month.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Harmful pattern of use of cannabis (6C41.1)

6C41.21 Cannabis dependence, early full remission

After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from cannabis during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Harmful pattern of use of cannabis (6C41.1)

6C41.22 Cannabis dependence, sustained partial remission

After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in cannabis consumption for more than 12 months, such that even though cannabis use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Harmful pattern of use of cannabis (6C41.1)

6C41.23 Cannabis dependence, sustained full remission

After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from cannabis for 12 months or longer.

Exclusions: Episode of harmful use of cannabis (6C41.0)

Harmful pattern of use of cannabis (6C41.1)

6C41.2Z Cannabis dependence, unspecified

6C41.3 Cannabis intoxication

Cannabis intoxication is a clinically significant transient condition that develops during or shortly after the consumption of cannabis that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of cannabis and their intensity is closely related to the amount of cannabis consumed. They are time-limited and abate as cannabis is cleared from the body. Presenting features may include inappropriate euphoria, impaired attention, impaired judgment, perceptual alterations (such as the sensation of floating, altered perception of time), changes in sociability, increased appetite, anxiety, intensification of ordinary experiences, impaired short-term memory, and sluggishness. Physical signs include conjunctival injection (red or bloodshot eyes) and tachycardia.

Coding Note: Code also the causing condition

Inclusions: "Bad trips" due to cannabinoids

Exclusions: cannabinoid poisoning (NE60)

Possession trance disorder (6B63)

6C41.4 Cannabis withdrawal

Cannabis withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of cannabis in individuals who have developed Cannabis dependence or have used cannabis for a prolonged period or in large amounts. Presenting features of Cannabis withdrawal may include irritability, anger or aggressive behaviour, shakiness, insomnia, restlessness, anxiety, depressed or dysphoric mood, decreased appetite and weight loss, headache, sweating or chills, abdominal cramps and muscle aches.

Coding Note: Code also the causing condition

6C41.5 **Cannabis-induced delirium**

Cannabis-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of cannabis. The amount and duration of cannabis use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C41.6 **Cannabis-induced psychotic disorder**

Cannabis-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with cannabis use).

Coding Note: Code also the causing condition

6C41.7 **Certain specified cannabis-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C41.70 Cannabis-induced mood disorder

Cannabis-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with cannabis use).

Coding Note: Code also the causing condition

6C41.71 Cannabis-induced anxiety disorder

Cannabis-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with cannabis use).

Coding Note: Code also the causing condition

6C41.Y **Other specified disorders due to use of cannabis**

6C41.Z **Disorders due to use of cannabis, unspecified**

6C42 Disorders due to use of synthetic cannabinoids

Disorders due to use of synthetic cannabinoids are characterised by the pattern and consequences of synthetic cannabinoid use. Synthetic cannabinoids are synthesized diverse chemical compounds that are potent agonists for endogenous cannabinoid receptors. There are several hundred such compounds. The synthetic compound is typically sprayed onto a vehicle such as cannabis or tea leaves and then smoked. The effect of these compounds is distinctly different from smoking naturally cultivated cannabis in that the euphoric effects are typically accompanied or dominated by psychotic-like symptoms (e.g., paranoia, hallucinations, and disorganized behavior). Synthetic Cannabinoid Intoxication may therefore present more frequently with psychotic symptoms in addition to the more typical effects of cannabis. Synthetic cannabinoids are also dependence-producing and Synthetic Cannabinoid Dependence and Synthetic Cannabinoid Withdrawal are recognized. Synthetic Cannabinoid-Induced Mental Disorders also occur; in particular Synthetic Cannabinoid-Induced Psychotic Disorder is recognized.

Exclusions: Disorders due to use of cannabis (6C41)

6C42.0 **Episode of harmful use of synthetic cannabinoids**

An episode of use of a synthetic cannabinoid that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to synthetic cannabinoid intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of synthetic cannabinoid use.

Exclusions: Harmful pattern of use of synthetic cannabinoids (6C42.1)

Synthetic cannabinoid dependence (6C42.2)

6C42.1 Harmful pattern of use of synthetic cannabinoids

A pattern of use of synthetic cannabinoids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of synthetic cannabinoid use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cannabinoid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cannabinoids applies.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Synthetic cannabinoid dependence (6C42.2)

6C42.10 Harmful pattern of use of synthetic cannabinoids, episodic

A pattern of episodic or intermittent use of synthetic cannabinoids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic synthetic cannabinoid use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cannabinoid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cannabinoids applies.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Synthetic cannabinoid dependence (6C42.2)

6C42.11 Harmful pattern of use of synthetic cannabinoids, continuous

A pattern of continuous (daily or almost daily) use of synthetic cannabinoids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous synthetic cannabinoid use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cannabinoid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cannabinoids applies.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Synthetic cannabinoid dependence (6C42.2)

6C42.1Y Other specified harmful pattern of use of synthetic cannabinoids

6C42.1Z Harmful pattern of use of synthetic cannabinoids, unspecified

6C42.2 **Synthetic cannabinoid dependence**

Synthetic cannabinoid dependence is a disorder of regulation of synthetic cannabinoid use arising from repeated or continuous use of synthetic cannabinoids. The characteristic feature is a strong internal drive to use synthetic cannabinoids, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use synthetic cannabinoids. Physiological features of dependence may also be present, including tolerance to the effects of synthetic cannabinoids, withdrawal symptoms following cessation or reduction in use of synthetic cannabinoids, or repeated use of synthetic cannabinoids or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if synthetic cannabinoid use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Harmful pattern of use of synthetic cannabinoids (6C42.1)

6C42.20 Synthetic cannabinoid dependence, current use

Current synthetic cannabinoid dependence with use of synthetic cannabinoids within the past month.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Harmful pattern of use of synthetic cannabinoids (6C42.1)

6C42.21 Synthetic cannabinoid dependence, early full remission

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from synthetic cannabinoid use during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Harmful pattern of use of synthetic cannabinoids (6C42.1)

6C42.22 Synthetic cannabinoid dependence, sustained partial remission

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in synthetic cannabinoid consumption for more than 12 months, such that even though synthetic cannabinoid use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Harmful pattern of use of synthetic cannabinoids (6C42.1)

6C42.23 Synthetic cannabinoid dependence, sustained full remission

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from synthetic cannabinoid use for 12 months or longer.

Exclusions: Episode of harmful use of synthetic cannabinoids (6C42.0)

Harmful pattern of use of synthetic cannabinoids (6C42.1)

6C42.2Y Other specified synthetic cannabinoid dependence

6C42.2Z Synthetic cannabinoid dependence, unspecified

6C42.3 Synthetic cannabinoid intoxication

Synthetic cannabinoid intoxication is a clinically significant transient condition that develops during or shortly after the consumption of synthetic cannabinoids that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of synthetic cannabinoids and their intensity is closely related to the amount of synthetic cannabinoid consumed. They are time-limited and abate as synthetic cannabinoid is cleared from the body. Presenting features may include inappropriate euphoria, impaired attention, impaired judgment, perceptual alterations (such as the sensation of floating, altered perception of time), changes in sociability, increased appetite, anxiety, intensification of ordinary experiences, impaired short-term memory, and sluggishness. Physical signs include conjunctival injection (red or bloodshot eyes) and tachycardia. Intoxication with synthetic cannabinoids may also cause delirium or acute psychosis.

Coding Note: Code also the causing condition

6C42.4 Synthetic cannabinoid withdrawal

Synthetic cannabinoid withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of synthetic cannabinoids in individuals who have developed Synthetic cannabinoid dependence or have used synthetic cannabinoids for a prolonged period or in large amounts. Presenting features of Synthetic cannabinoid withdrawal may include irritability, anger, aggression, shakiness, insomnia and disturbing dreams, restlessness, anxiety, depressed mood and appetite disturbance. In the early phase, Synthetic cannabinoid withdrawal may be accompanied by residual features of intoxication from the drug, such as paranoid ideation and auditory and visual hallucinations.

Coding Note: Code also the causing condition

6C42.5 Synthetic cannabinoid-induced delirium

Synthetic cannabinoid-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of synthetic cannabinoids. The amount and duration of synthetic cannabinoid use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C42.6 **Synthetic cannabinoid-induced psychotic disorder**

Synthetic cannabinoid-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

Coding Note: Code also the causing condition

6C42.7 **Certain specified synthetic cannabinoids-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C42.70 Synthetic cannabinoid-induced mood disorder

Synthetic cannabinoid-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

Coding Note: Code also the causing condition

6C42.71 Synthetic cannabinoid-induced anxiety disorder

Synthetic cannabinoid-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

Coding Note: Code also the causing condition

6C42.Y Other specified disorders due to use of synthetic cannabinoids

6C42.Z Disorders due to use of synthetic cannabinoids, unspecified

6C43 Disorders due to use of opioids

Disorders due to use of opioids are characterised by the pattern and consequences of opioid use. Opioids is a generic term that encompasses the constituents or derivatives of the opium poppy Papaver somniferum as well as a range of synthetic and semisynthetic compounds, some related to morphine and others chemically distinct but all having their primary actions on the μ opioid receptor. Examples of opioids include morphine, diacetylmorphine (heroin), fentanyl, pethidine, oxycodone, hydromorphone, methadone, buprenorphine, codeine and d-propoxyphene. The opioids all have analgesic properties of different potencies and are primarily central nervous system depressants. They suppress respiration as well as other vital functions and are a common cause of overdose and related deaths. Certain opioids are used or administered parenterally, including heroin, a common and potent opioid that is primarily used non-medically. Therapeutic opioids are prescribed for a range of indications worldwide, and are essential for pain management in cancer pain and palliative care, although they are also used for non-therapeutic reasons. In some countries morbidity and mortality related to therapeutic opioids is greater than that related to heroin. All opioids may result in Opioid Intoxication, Opioid Dependence and Opioid Withdrawal. A range of Opioid-Induced Disorders occur, some of which occur following Opioid Withdrawal.

Exclusions: Hazardous use of opioids (QE11.0)

6C43.0 Episode of harmful use of opioids

An episode of opioid use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to opioid intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of opioid use.

Exclusions: Harmful pattern of use of opioids (6C43.1)

Opioid dependence (6C43.2)

6C43.1 Harmful pattern of use of opioids

A pattern of use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of opioid use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

Exclusions: Episode of harmful use of opioids (6C43.0)

Opioid dependence (6C43.2)

6C43.10 Harmful pattern of use of opioids, episodic

A pattern of episodic or intermittent use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic opioid use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

Exclusions: Episode of harmful use of opioids (6C43.0)

Opioid dependence (6C43.2)

6C43.11 Harmful pattern of use of opioids, continuous

A pattern of continuous (daily or almost daily) use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous opioid use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

Exclusions: Episode of harmful use of opioids (6C43.0)

Opioid dependence (6C43.2)

6C43.1Z Harmful pattern of use of opioids, unspecified

6C43.2 Opioid dependence

Opioid dependence is a disorder of regulation of opioid use arising from repeated or continuous use of opioids. The characteristic feature is a strong internal drive to use opioids, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use opioids. Physiological features of dependence may also be present, including tolerance to the effects of opioids, withdrawal symptoms following cessation or reduction in use of opioids, or repeated use of opioids or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if opioid use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of opioids (6C43.0)

Harmful pattern of use of opioids (6C43.1)

6C43.20 Opioid dependence, current use

Opioid dependence, with use of an opioid within the past month.

Exclusions: Episode of harmful use of opioids (6C43.0)

Harmful pattern of use of opioids (6C43.1)

6C43.21 Opioid dependence, early full remission

After a diagnosis of opioid dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from opioid use during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of opioids (6C43.0)

Harmful pattern of use of opioids (6C43.1)

6C43.22 Opioid dependence, sustained partial remission

After a diagnosis of Opioid dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in opioid consumption for more than 12 months, such that even though opioid use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of opioids (6C43.0)

Harmful pattern of use of opioids (6C43.1)

6C43.23 Opioid dependence, sustained full remission

After a diagnosis of Opioid dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from opioids for 12 months or longer.

Exclusions: Episode of harmful use of opioids (6C43.0)

Harmful pattern of use of opioids (6C43.1)

6C43.2Z Opioid dependence, unspecified

6C43.3 Opioid intoxication

Opioid intoxication is a clinically significant transient condition that develops during or shortly after the consumption of opioids that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of opioids and their intensity is closely related to the amount of opioids consumed. They are time-limited and abate as opioids are cleared from the body. Presenting features may include somnolence, stupor, mood changes (e.g. euphoria followed by apathy and dysphoria), psychomotor retardation, impaired judgment, respiratory depression, slurred speech, and impairment of memory and attention. In severe intoxication coma may ensue. A characteristic physical sign is pupillary constriction but this sign may be absent when intoxication is due to synthetic opioids. Severe opioid intoxication can lead to death due to respiratory depression.

Coding Note: Code also the causing condition

Exclusions: opioid poisoning (NE60)

Possession trance disorder (6B63)

fentanyl poisoning (NE60)

oxycodone poisoning (NE60)

6C43.4 Opioid withdrawal

Opioid withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of opioids in individuals who have developed Opioid dependence or have used opioids for a prolonged period or in large amounts. Opioid withdrawal can also occur when prescribed opioids have been used in standard therapeutic doses. Presenting features of Opioid withdrawal may include dysphoric mood, craving for an opioid, anxiety, nausea or vomiting, abdominal cramps, muscle aches, yawning, perspiration, hot and cold flushes, lacrimation, rhinorrhea, hypersomnia (typically in the initial phase) or insomnia, diarrhea, piloerection, and pupillary dilatation.

Coding Note: Code also the causing condition

6C43.5 Opioid-induced delirium

Opioid-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of opioids. The amount and duration of opioid use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, Behavioural, and Neurodevelopmental Disorders.

Coding Note: Code also the causing condition

Inclusions: Delirium induced by opioid withdrawal

6C43.6 Opioid-induced psychotic disorder

Opioid-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from opioids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Opioid intoxication or Opioid withdrawal. The amount and duration of opioid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the opioid use, if the symptoms persist for a substantial period of time after cessation of the opioid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with opioid use).

Coding Note: Code also the causing condition

6C43.7 Certain specified opioid-induced mental or behavioural disorders

Coding Note: Code also the causing condition

6C43.70 Opioid-induced mood disorder

Opioid-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from opioids. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Opioid intoxication or Opioid withdrawal. The amount and duration of opioid use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the opioid use, if the symptoms persist for a substantial period of time after cessation of the opioid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with opioid use).

Coding Note: Code also the causing condition

6C43.71 Opioid-induced anxiety disorder

Opioid-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from opioids. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Opioid intoxication or Opioid withdrawal. The amount and duration of opioid use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the opioid use, if the symptoms persist for a substantial period of time after cessation of the opioid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with opioid use).

Coding Note: Code also the causing condition

6C43.Y **Other specified disorders due to use of opioids**

6C43.Z **Disorders due to use of opioids, unspecified**

6C44 Disorders due to use of sedatives, hypnotics or anxiolytics

Disorders due to use of sedatives, hypnotics or anxiolytics are characterised by the pattern and consequences of use of these substances. Sedatives, hypnotics, and anxiolytics are typically prescribed for the short-term treatment of anxiety or insomnia and are also employed to provide sedation for medical procedures. They include the benzodiazepines and the non-benzodiazepine positive allosteric modulators of GABA receptors (i.e., ‘Z-drugs’) as well as many other compounds. Sedatives, hypnotics, and anxiolytics include barbiturates, which are available much less commonly now than in previous decades. Sedatives, hypnotics, and anxiolytics have dependence-inducing properties that are related to the dose and duration of their use. They may cause intoxication, dependence and withdrawal. Several other mental disorders induced by sedatives, hypnotics, or anxiolytics are recognized.

Exclusions: Hazardous use of sedatives, hypnotics or anxiolytics (QE11.2)

6C44.0 Episode of harmful use of sedatives, hypnotics or anxiolytics

An episode of use of a sedative, hypnotic or anxiolytic that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to sedative, hypnotic or anxiolytic intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of sedative, hypnotic or anxiolytic use.

Exclusions: Sedative, hypnotic or anxiolytic dependence (6C44.2)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.1 Harmful pattern of use of sedatives, hypnotics or anxiolytics

A pattern of sedative, hypnotic, or anxiolytic use that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of sedative, hypnotic, or anxiolytic use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

Exclusions: Sedative, hypnotic or anxiolytic dependence (6C44.2)

Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

6C44.10 Harmful pattern of use of sedatives, hypnotics or anxiolytics, episodic

A pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics is evident over a period of at least 12 months. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Sedative, hypnotic or anxiolytic dependence (6C44.2)

6C44.11 Harmful pattern of use of sedatives, hypnotics or anxiolytics, continuous

A pattern of continuous use of sedatives, hypnotics or anxiolytics (daily or almost daily) that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of continuous use of sedatives, hypnotics or anxiolytics is evident over a period of at least one month. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Sedative, hypnotic or anxiolytic dependence (6C44.2)

6C44.1Z Harmful pattern of use of sedatives, hypnotics or anxiolytics, unspecified

6C44.2 Sedative, hypnotic or anxiolytic dependence

Sedative, hypnotic or anxiolytic dependence is a disorder of regulation of sedative use arising from repeated or continuous use of these substances. The characteristic feature is a strong internal drive to use sedatives, hypnotics, or anxiolytics, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use these substances. Physiological features of dependence may also be present, including tolerance to the effects of sedatives, hypnotics or anxiolytics, withdrawal symptoms following cessation or reduction in use, or repeated use of sedatives or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if sedative use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.20 Sedative, hypnotic or anxiolytic dependence, current use

Current Sedative, hypnotic or anxiolytic dependence with use of a sedative, hypnotic or anxiolytic drug within the past month.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.21 Sedative, hypnotic or anxiolytic dependence, early full remission

After a diagnosis of Sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from sedatives, hypnotics or anxiolytics during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.22 Sedative, hypnotic or anxiolytic dependence, sustained partial remission

After a diagnosis of Sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in sedative, hypnotic or anxiolytic consumption for more than 12 months, such that even though sedative, hypnotic or anxiolytic use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.23 Sedative, hypnotic or anxiolytic dependence, sustained full remission

After a diagnosis of sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from sedative, hypnotic or anxiolytic for 12 months or longer.

Exclusions: Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

6C44.2Z Sedative, hypnotic or anxiolytic dependence, unspecified

6C44.3 **Sedative, hypnotic or anxiolytic intoxication**

Sedative, hypnotic or anxiolytic intoxication is a clinically significant transient condition that develops during or shortly after the consumption of sedatives, hypnotics or anxiolytics that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of sedatives, hypnotics or anxiolytics and their intensity is closely related to the amount of sedatives, hypnotics or anxiolytics consumed. They are time-limited and abate as sedatives, hypnotics or anxiolytics are cleared from the body. Presenting features may include somnolence, impaired judgment, inappropriate behavior (including sexual behavior or aggression), slurred speech, impaired motor coordination, unsteady gait, mood changes, as well as impaired memory, attention and concentration. Nystagmus (repetitive, uncontrolled eye movements) is a common physical sign. In severe cases stupor or coma may occur.

Coding Note: Code also the causing condition

Inclusions: "Bad trips" due to sedatives, hypnotics or anxiolytics

Exclusions: sedative, hypnotic drugs and other CNS depressants poisoning (NE60)

Possession trance disorder (6B63)

6C44.4 **Sedative, hypnotic or anxiolytic withdrawal**

Sedative, hypnotic or anxiolytic withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of sedatives, hypnotics or anxiolytics in individuals who have developed dependence or have used sedatives, hypnotics or anxiolytics for a prolonged period or in large amounts. Sedative, hypnotic or anxiolytic withdrawal can also occur when prescribed sedatives, hypnotics or anxiolytics have been used in standard therapeutic doses. Presenting features of Sedative, hypnotic or anxiolytic withdrawal may include anxiety, psychomotor agitation, insomnia, increased hand tremor, nausea or vomiting, and transient visual, tactile or auditory illusions or hallucinations. There may be signs of autonomic hyperactivity (e.g., tachycardia, hypertension, sweating), or postural hypotension. The withdrawal state may be complicated by seizures. Less commonly, there may be progression to a more severe withdrawal state characterised by confusion and disorientation, delusions, and more prolonged visual, tactile or auditory hallucinations. In such cases, a separate diagnosis of Sedative, hypnotic, or anxiolytic-induced delirium should be assigned.

Coding Note: Code also the causing condition

6C44.40 Sedative, hypnotic or anxiolytic withdrawal, uncomplicated

All diagnostic requirements for Sedative, hypnotic or anxiolytic Withdrawal are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.

Coding Note: Code also the causing condition

6C44.41 Sedative, hypnotic or anxiolytic withdrawal, with perceptual disturbances

All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.

Coding Note: Code also the causing condition

6C44.42 Sedative, hypnotic or anxiolytic withdrawal, with seizures

All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.

Coding Note: Code also the causing condition

6C44.43 Sedative, hypnotic or anxiolytic withdrawal, with perceptual disturbances and seizures

All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by both seizures (i.e., generalised tonic-clonic seizures) and perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. Diagnostic requirements for Delirium are not met.

Coding Note: Code also the causing condition

6C44.4Z Sedative, hypnotic or anxiolytic withdrawal, unspecified

Coding Note: Code also the causing condition

6C44.5 Sedative, hypnotic or anxiolytic-induced delirium

Sedative, hypnotic or anxiolytic-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of sedatives, hypnotics, or anxiolytics. Specific features of Sedative, hypnotic or anxiolytic-induced delirium may include confusion and disorientation, paranoid delusions, and recurrent visual, tactile or auditory hallucinations. The amount and duration of sedative, hypnotic, or anxiolytic use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

Inclusions: Delirium induced by sedative, hypnotic or anxiolytic withdrawal

6C44.6 **Sedative, hypnotic or anxiolytic-induced psychotic disorder**

Sedative, hypnotic or anxiolytic-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

Coding Note: Code also the causing condition

Coding Note: Code also the causing condition

Coded Elsewhere: Amnestic disorder due to use of sedatives, hypnotics or anxiolytics (6D72.11)

Dementia due to use of sedatives, hypnotics or anxiolytics (6D84.1)

6C44.70 Sedative, hypnotic or anxiolytic-induced mood disorder

Sedative, hypnotic or anxiolytic-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

Coding Note: Code also the causing condition

6C44.71 Sedative, hypnotic or anxiolytic-induced anxiety disorder

Sedative, hypnotic or anxiolytic-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

Coding Note: Code also the causing condition

6C44.Z **Disorders due to use of sedatives, hypnotics or anxiolytics, unspecified**

6C45 Disorders due to use of cocaine

Disorders due to use of cocaine are characterised by the pattern and consequences of cocaine use. Cocaine is a compound found in the leaves of the coca plant, Erythroxylum coca, which is indigenous to countries in northern regions of South America. Cocaine has a limited place in medical treatment as an anaesthetic and vasoconstrictive agent. It is commonly used illicitly and widely available across the world, where it is found in two main forms: cocaine hydrochloride and cocaine freebase (also known as ‘crack’). Cocaine is a central nervous system stimulant, and Cocaine Intoxication typically includes a state of euphoria and hyperactivity. Cocaine has potent dependence-producing properties and Cocaine Dependence is a common cause of morbidity and of clinical presentations. Cocaine Withdrawal has a characteristic course that includes lethargy and depressed mood. A range of Cocaine-Induced Mental Disorders is described.

Exclusions: Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)

Hazardous use of cocaine (QE11.3)

6C45.0 Episode of harmful use of cocaine

An episode of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cocaine intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cocaine use.

Exclusions: Cocaine dependence (6C45.2)

Harmful pattern of use of cocaine (6C45.1)

6C45.1 Harmful pattern of use of cocaine

A pattern of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cocaine use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.

Exclusions: Cocaine dependence (6C45.2)

Episode of harmful use of cocaine (6C45.0)

6C45.10 Harmful pattern of use of cocaine, episodic

A pattern of episodic or intermittent cocaine use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic cocaine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Cocaine dependence (6C45.2)

6C45.11 Harmful pattern of use of cocaine, continuous

A pattern of continuous (daily or almost daily) cocaine use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous cocaine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Cocaine dependence (6C45.2)

6C45.1Z Harmful pattern of use of cocaine, unspecified

6C45.2 **Cocaine dependence**

Cocaine dependence is a disorder of regulation of cocaine use arising from repeated or continuous use of cocaine. The characteristic feature is a strong internal drive to use cocaine, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use cocaine. Physiological features of dependence may also be present, including tolerance to the effects of cocaine, withdrawal symptoms following cessation or reduction in use of cocaine, or repeated use of cocaine or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if cocaine use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Harmful pattern of use of cocaine (6C45.1)

6C45.20 Cocaine dependence, current use

Current cocaine dependence with cocaine use within the past month.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Harmful pattern of use of cocaine (6C45.1)

6C45.21 Cocaine dependence, early full remission

After a diagnosis of Cocaine dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from cocaine during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Harmful pattern of use of cocaine (6C45.1)

6C45.22 Cocaine dependence, sustained partial remission

After a diagnosis of Cocaine dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in cocaine consumption for more than 12 months, such that even though cocaine use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Harmful pattern of use of cocaine (6C45.1)

6C45.23 Cocaine dependence, sustained full remission

After a diagnosis of cocaine dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from cocaine for 12 months or longer.

Exclusions: Episode of harmful use of cocaine (6C45.0)

Harmful pattern of use of cocaine (6C45.1)

6C45.2Z Cocaine dependence, unspecified

6C45.3 Cocaine intoxication

Cocaine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of cocaine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of cocaine and their intensity is closely related to the amount of cocaine consumed. They are time-limited and abate as cocaine is cleared from the body. Presenting features may include inappropriate euphoria, anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (sometimes of delusional intensity), auditory hallucinations, confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations and chest pain may be experienced. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, usually in severe intoxication, cocaine use can result in seizures, muscle weakness, dyskinesia, or dystonia.

Coding Note: Code also the causing condition

Exclusions: cocaine poisoning (NE60)

Possession trance disorder (6B63)

6C45.4 Cocaine withdrawal

Cocaine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of cocaine in individuals who have developed Cocaine dependence or have used cocaine for a prolonged period or in large amounts. Presenting features of Cocaine withdrawal may include dysphoric mood, irritability, fatigue, psychomotor retardation, vivid unpleasant dreams, insomnia or hypersomnia, increased appetite, anxiety, psychomotor agitation or retardation, and craving for cocaine.

Coding Note: Code also the causing condition

6C45.5 **Cocaine-induced delirium**

Cocaine-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of cocaine. The amount and duration of cocaine use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural, and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C45.6 **Cocaine-induced psychotic disorder**

Cocaine-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with cocaine use).

Coding Note: Code also the causing condition

6C45.60 Cocaine-induced psychotic disorder with hallucinations

Cocaine-induced psychotic disorder with hallucinations is characterised by the by the presence of hallucinations that are judged to be the direct consequence of cocaine use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C45.61 Cocaine-induced psychotic disorder with delusions

Cocaine-induced psychotic disorder with delusions is characterised by the by the presence of delusions that are judged to be the direct consequence of cocaine use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C45.62 Cocaine-induced psychotic disorder with mixed psychotic symptoms

Cocaine-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of cocaine use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C45.6Z Cocaine-induced psychotic disorder, unspecified

Coding Note: Code also the causing condition

6C45.7 Certain specified cocaine-induced mental or behavioural disorders

Coding Note: Code also the causing condition

6C45.70 Cocaine-induced mood disorder

Cocaine-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with cocaine use).

Coding Note: Code also the causing condition

6C45.71 Cocaine-induced anxiety disorder

Cocaine-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with cocaine use).

Coding Note: Code also the causing condition

6C45.72 Cocaine-induced obsessive-compulsive or related disorder

Cocaine-induced obsessive-compulsive or related disorder is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with cocaine use).

Coding Note: Code also the causing condition

6C45.73 Cocaine-induced impulse control disorder

Cocaine-induced impulse control disorder is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with cocaine use).

Coding Note: Code also the causing condition

6C45.Y **Other specified disorders due to use of cocaine**

6C45.Z **Disorders due to use of cocaine, unspecified**

6C46 Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone

Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone are characterised by the pattern and consequences of use of these substances. There is a wide array of naturally occurring and synthetically produced psychostimulants other than cocaine. The most numerous of this group are the amphetamine-type substances, including methamphetamine. Prescribed stimulants including dexamphetamine are indicated for a limited number of conditions such as for Attention Deficit Hyperactivity Disorder. Methcathinone, known in many countries as ephedrone, is a synthetic potent stimulant that is a structural analogue of methamphetamine and is related to cathinone. All these drugs have primarily psychostimulant properties and are also vasoconstrictors to a varying degree. They induce euphoria and hyperactivity as may be seen in Stimulant Intoxication. They have potent dependence-producing properties, which may lead to the diagnosis of Stimulant Dependence and Stimulant Withdrawal following the cessation of use. Several Stimulant-Induced Mental Disorders are described.

Exclusions: Disorders due to use of synthetic cathinones (6C47)

Disorders due to use of caffeine (6C48)

Disorders due to use of cocaine (6C45)

Hazardous use of stimulants including amphetamines or methamphetamine (QE11.4)

6C46.0 Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone

An episode of use of a stimulant including amphetamines, methamphetamine and methcathinone that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to stimulant intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of stimulant including amphetamines, methamphetamine and methcathinone use.

Exclusions: Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

6C46.1 **Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone**

A pattern of use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of stimulant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

Exclusions: Harmful pattern of use of caffeine (6C48.1)

Harmful pattern of use of cocaine (6C45.1)

Harmful pattern of use of synthetic cathinones (6C47.1)

Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

6C46.10 Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone, episodic

A pattern of episodic or intermittent use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic stimulant use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

Exclusions: Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

6C46.11 Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone, continuous

A pattern of use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of stimulant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

Exclusions: Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

6C46.1Z Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone, unspecified

6C46.2 Stimulant dependence including amphetamines, methamphetamine or methcathinone

Stimulant dependence including amphetamines, methamphetamine or methcathinone is a disorder of regulation of stimulant use arising from repeated or continuous use of stimulants. The characteristic feature is a strong internal drive to use stimulants, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use stimulants. Physiological features of dependence may also be present, including tolerance to the effects of stimulants, withdrawal symptoms following cessation or reduction in use of stimulants, or repeated use of stimulants or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if stimulant use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Cocaine dependence (6C45.2)

Synthetic cathinone dependence (6C47.2)

Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

6C46.20 Stimulant dependence including amphetamines, methamphetamine or methcathinone, current use

Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones refers to amphetamine or other stimulant use within the past month.

Exclusions: Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

6C46.21 Stimulant dependence including amphetamines, methamphetamine or methcathinone, early full remission

After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from stimulants during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

6C46.22 Stimulant dependence including amphetamines, methamphetamine or methcathinone, sustained partial remission

After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in amphetamine or other stimulant consumption for more than 12 months, such that even though amphetamine or other stimulant use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

6C46.23 Stimulant dependence including amphetamines, methamphetamine or methcathinone, sustained full remission

After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from amphetamine or other stimulants for 12 months or longer.

Exclusions: Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

6C46.2Z Stimulant dependence including amphetamines, methamphetamine or methcathinone, unspecified

6C46.3 **Stimulant intoxication including amphetamines, methamphetamine or methcathinone**

Stimulant intoxication including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones is a clinically significant transient condition that develops during or shortly after the consumption of amphetamine or other stimulants that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of amphetamine or other stimulants and their intensity is closely related to the amount of amphetamine or other stimulant consumed. They are time-limited and abate as amphetamine or another stimulant is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of stimulants including amphetamines, methamphetamine and methcathinone can result in seizures.

Coding Note: Code also the causing condition

Exclusions: amphetamine poisoning (NE60)

Caffeine intoxication (6C48.2)

Cocaine intoxication (6C45.3)

Synthetic cathinone intoxication (6C47.3)

Possession trance disorder (6B63)

6C46.4 **Stimulant withdrawal including amphetamines, methamphetamine or methcathinone**

Stimulant withdrawal including amphetamines, methamphetamine and methcathinone is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of stimulants in individuals who have developed Stimulant dependence or have used stimulants for a prolonged period or in large amounts. Stimulant withdrawal can also occur when prescribed stimulants have been used in standard therapeutic doses. Presenting features of stimulant withdrawal may include dysphoric mood, irritability, fatigue, insomnia or (more commonly) hypersomnia, vivid and unpleasant dreams, increased appetite, psychomotor agitation or retardation, and craving for amphetamine or related stimulants.

Coding Note: Code also the causing condition

Exclusions: Cocaine withdrawal (6C45.4)

Caffeine withdrawal (6C48.3)

Synthetic cathinone withdrawal (6C47.4)

6C46.5 Stimulant-induced delirium including amphetamines, methamphetamine or methcathinone

Stimulant-induced delirium including amphetamines, methamphetamine and methcathinone is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of stimulants. The amount and duration of stimulant use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

Exclusions: Cocaine-induced delirium (6C45.5)

Synthetic cathinone-induced delirium (6C47.5)

Disorders due to use of caffeine (6C48)

6C46.6 Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced psychotic disorder including amphetamines, methamphetamine and methcathinone is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with use of stimulants).

Coding Note: Code also the causing condition

Exclusions: Cocaine-induced psychotic disorder (6C45.6)

Synthetic cathinone-induced psychotic disorder (6C47.6)

Disorders due to use of caffeine (6C48)

6C46.60 Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone with hallucinations

Stimulant-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of stimulant use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

Exclusions: Cocaine-induced psychotic disorder with hallucinations (6C45.60)

Disorders due to use of caffeine (6C48)

Synthetic cathinone-induced psychotic disorder with hallucinations (6C47.60)

6C46.61 Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone with delusions

Stimulant-induced psychotic disorder including amphetamines, methamphetamine and methcathinone is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with use of stimulants).

Coding Note: Code also the causing condition

Exclusions: Disorders due to use of caffeine (6C48)

Cocaine-induced psychotic disorder with delusions (6C45.61)

Synthetic cathinone-induced psychotic disorder with delusions (6C47.61)

6C46.62 Stimulant-induced psychotic disorder including amphetamines but excluding caffeine or cocaine with mixed psychotic symptoms

Stimulant-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of stimulant use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

Exclusions: Disorders due to use of caffeine (6C48)

Cocaine-induced psychotic disorder with mixed psychotic symptoms (6C45.62)

Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms (6C47.62)

6C46.6Z Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone, unspecified

Coding Note: Code also the causing condition

6C46.7 Certain specified stimulant-induced mental or behavioural disorders including amphetamines, methamphetamine or methcathinone

Coding Note: Code also the causing condition

6C46.70 Stimulant-induced mood disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced mood disorder including amphetamines, methamphetamine and methcathinone is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with use of stimulants).

Coding Note: Code also the causing condition

Exclusions: Synthetic cathinone-induced mood disorder (6C47.70)

Cocaine-induced mood disorder (6C45.70)

Disorders due to use of caffeine (6C48)

6C46.71 Stimulant-induced anxiety disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced anxiety disorder including amphetamines, methamphetamine and methcathinone is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with use of stimulants).

Coding Note: Code also the causing condition

Exclusions: Cocaine-induced anxiety disorder (6C45.71)

Caffeine-induced anxiety disorder (6C48.40)

Synthetic cathinone-induced anxiety disorder (6C47.71)

6C46.72 Stimulant-induced obsessive-compulsive or related disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced obsessive-compulsive or related disorder including amphetamines, methamphetamine and methcathinone is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from stimulants. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with stimulant use).

Coding Note: Code also the causing condition

Exclusions: Cocaine-induced obsessive-compulsive or related disorder (6C45.72)

Synthetic cathinone-induced obsessive-compulsive or related syndrome (6C47.72)

Disorders due to use of caffeine (6C48)

6C46.73 Stimulant-induced impulse control disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced impulse control disorder including amphetamines, methamphetamine and methcathinone is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from stimulants. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with stimulant use).

Coding Note: Code also the causing condition

6C46.Y **Other specified disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone**

6C46.Z **Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone, unspecified**

6C47 Disorders due to use of synthetic cathinones

Disorders due to use of synthetic cathinones are characterised by the pattern and consequences of synthetic cathinone use. Synthetic cathinones (also known as 'bath salts') are synthetic compounds with stimulant properties related to cathinone found in the khat plant, Catha edulis. The use of synthetic cathinones is common in young populations in many countries. They may produce a range of disorders including Synthetic Cathinone Intoxication, Synthetic Cathinone Dependence and Synthetic Cathinone Withdrawal. Several synthetic cathinone-induced mental disorders are recognised.

6C47.0 **Episode of harmful use of synthetic cathinones**

An episode of synthetic cathinone use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to synthetic cathinone intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of synthetic cathinone use.

Exclusions: Harmful pattern of use of synthetic cathinones (6C47.1)

Synthetic cathinone dependence (6C47.2)

6C47.1 **Harmful pattern of use of synthetic cathinones**

A pattern of use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of synthetic cathinone use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cathinones applies.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Synthetic cathinone dependence (6C47.2)

6C47.10 Harmful pattern of use of synthetic cathinones, episodic

A pattern of episodic or intermittent use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic synthetic cathinone use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cathinones applies.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Synthetic cathinone dependence (6C47.2)

6C47.11 Harmful use of synthetic cathinones, continuous

A pattern of continuous (daily or almost daily) use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous synthetic cathinone use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful use of synthetic cathinones applies.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Synthetic cathinone dependence (6C47.2)

6C47.1Y Other specified harmful pattern of use of synthetic cathinones

6C47.1Z Harmful pattern of use of synthetic cathinones, unspecified

6C47.2 Synthetic cathinone dependence

Synthetic cathinone dependence is a disorder of regulation of synthetic cathinone use arising from repeated or continuous use of synthetic cathinones. The characteristic feature is a strong internal drive to use synthetic cathinones, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use synthetic cathinones. Physiological features of dependence may also be present, including tolerance to the effects of synthetic cathinones, withdrawal symptoms following cessation or reduction in use of synthetic cathinones, or repeated use of synthetic cathinones or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if synthetic cathinone use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Harmful pattern of use of synthetic cathinones (6C47.1)

Episode of harmful use of synthetic cathinones (6C47.0)

6C47.20 Synthetic cathinone dependence, current use

Current synthetic cathinone dependence with use of synthetic cathinones within the past month.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Harmful pattern of use of synthetic cathinones (6C47.1)

6C47.21 Synthetic cathinone dependence, early full remission

After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from synthetic cathinone use during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Harmful pattern of use of synthetic cathinones (6C47.1)

6C47.22 Synthetic cathinone dependence, sustained partial remission

After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in synthetic cathinone consumption for more than 12 months, such that even though synthetic cathinone use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Harmful pattern of use of synthetic cathinones (6C47.1)

6C47.23 Synthetic cathinone dependence, sustained full remission

After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from synthetic cathinone use for 12 months or longer.

Exclusions: Episode of harmful use of synthetic cathinones (6C47.0)

Harmful pattern of use of synthetic cathinones (6C47.1)

6C47.2Y Other specified synthetic cathinone dependence

6C47.2Z Synthetic cathinone dependence, unspecified

6C47.3 **Synthetic cathinone intoxication**

Synthetic cathinone intoxication is a clinically significant transient condition that develops during or shortly after the consumption of synthetic cathinones that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of synthetic cathinones and their intensity is closely related to the amount of synthetic cathinones consumed. They are time-limited and abate as the synthetic cathinone is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of synthetic cathinones can result in seizures.

Coding Note: Code also the causing condition

6C47.4 **Synthetic cathinone withdrawal**

Synthetic cathinone withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of synthetic cathinones in individuals who have developed Synthetic cathinone dependence or have used synthetic cathinones for a prolonged period or in large amounts. Presenting features of Synthetic cathinone withdrawal may include dysphoric mood, irritability, fatigue, insomnia or (more commonly) hypersomnia, vivid and unpleasant dreams, increased appetite, psychomotor agitation or retardation, and craving for stimulants, including synthetic cathinones.

Coding Note: Code also the causing condition

6C47.5 **Synthetic cathinone-induced delirium**

Synthetic cathinone-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of synthetic cathinones. The amount and duration of synthetic cathinone use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C47.6 **Synthetic cathinone-induced psychotic disorder**

Synthetic cathinone-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

Coding Note: Code also the causing condition

6C47.60 Synthetic cathinone-induced psychotic disorder with hallucinations

Synthetic cathinone-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of synthetic cathinone use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C47.61 Synthetic cathinone-induced psychotic disorder with delusions

Synthetic cathinone psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of synthetic cathinone use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C47.62 Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms

Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of synthetic cathinone use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

Coding Note: Code also the causing condition

6C47.6Z Synthetic cathinone-induced psychotic disorder, unspecified

Coding Note: Code also the causing condition

6C47.7 **Certain specified synthetic cathinone-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C47.70 Synthetic cathinone-induced mood disorder

Synthetic cathinone-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

Coding Note: Code also the causing condition

6C47.71 Synthetic cathinone-induced anxiety disorder

Synthetic cathinone-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

Coding Note: Code also the causing condition

6C47.72 Synthetic cathinone-induced obsessive-compulsive or related syndrome

Synthetic cathinone-induced obsessive-compulsive or related disorder is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

Coding Note: Code also the causing condition

6C47.73 Synthetic cathinone-induced impulse control disorder

Synthetic cathinone-induced impulse control disorder is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

Coding Note: Code also the causing condition

6C47.Y **Other specified disorders due to use of synthetic cathinones**

6C47.Z **Disorders due to use of synthetic cathinones, unspecified**

6C48 Disorders due to use of caffeine

Disorders due to use of caffeine are characterised by the pattern and consequences of caffeine use. Caffeine is a mild psychostimulant and diuretic that is found in the beans of the coffee plant (Coffea species) and is a constituent of coffee, cola drinks, chocolate, a range of proprietary 'energy drinks' and weight-loss aids. It is the most commonly used psychoactive substance worldwide and several clinical conditions related to its use are described, although severe disorders are comparatively rare considering its ubiquity. Caffeine Intoxication related to consumption of relatively higher doses (i.e., > 1 g per day) is described. Caffeine Withdrawal is common upon cessation of use among individuals who have used caffeine for a prolonged period or in large amounts. Caffeine-Induced Anxiety Disorder has been described, often following intoxication or heavy use.

Exclusions: Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)

Hazardous use of caffeine (QE11.5)

6C48.0 Episode of harmful use of caffeine

An episode of caffeine use that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of caffeine use.

Exclusions: Harmful pattern of use of caffeine (6C48.1)

6C48.1 Harmful pattern of use of caffeine

A pattern of caffeine use that has caused clinically significant harm to a person's physical or mental health or in which caffeine-induced behaviour has caused clinically significant harm to the health of other people. The pattern of caffeine use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of caffeine, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

Exclusions: Episode of harmful use of caffeine (6C48.0)

6C48.10 Harmful pattern of use of caffeine, episodic

A pattern of episodic or intermittent caffeine use that has caused damage to a person's physical or mental health. The pattern of episodic caffeine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

Exclusions: Episode of harmful use of caffeine (6C48.0)

6C48.11 Harmful pattern of use of caffeine, continuous

A pattern of continuous (daily or almost daily) caffeine use that has caused damage to a person's physical or mental health. The pattern of continuous caffeine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

Exclusions: Episode of harmful use of caffeine (6C48.0)

6C48.1Z Harmful pattern of use of caffeine, unspecified

6C48.2 **Caffeine intoxication**

Caffeine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of caffeine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of caffeine and their intensity is closely related to the amount of caffeine consumed. They are time-limited and abate as caffeine is cleared from the body. Presenting features may include restlessness, anxiety, excitement, insomnia, flushed face, tachycardia, diuresis, gastrointestinal disturbances, muscle twitching, psychomotor agitation, perspiration or chills, and nausea or vomiting. Cardiac arrhythmias may occur. Disturbances typical of intoxication tend to occur at relatively higher doses (e.g., > 1 g per day). Very high doses of caffeine (e.g., > 5 g) can result in respiratory distress or seizures and can be fatal.

Coding Note: Code also the causing condition

6C48.3 **Caffeine withdrawal**

Caffeine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of caffeine (typically in the form of coffee, caffeinated drinks, or as an ingredient in certain over-the-counter medications) in individuals who have used caffeine for a prolonged period or in large amounts. Presenting features of Caffeine withdrawal may include headache, marked fatigue or drowsiness, irritability, depressed or dysphoric mood, nausea or vomiting, and difficulty concentrating.

Coding Note: Code also the causing condition

6C48.4 **Certain specified caffeine-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C48.40 Caffeine-induced anxiety disorder

Caffeine-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from caffeine. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Caffeine intoxication or Caffeine withdrawal. The amount and duration of caffeine use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the caffeine use, if the symptoms persist for a substantial period of time after cessation of the caffeine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with caffeine use).

Coding Note: Code also the causing condition

6C48.Y **Other specified disorders due to use of caffeine**

6C48.Z **Disorders due to use of caffeine, unspecified**

6C49 Disorders due to use of hallucinogens

Disorders due to use of hallucinogens are characterised by the pattern and consequences of hallucinogen use. Several thousand compounds have hallucinogenic properties, many of which are found in plants (e.g., mescaline) and fungi (e.g., psilocybin) or are chemically synthesized (e.g., lysergic acid diethylamide [LSD]). These compounds have primarily hallucinogenic properties, but some may also be stimulants. Much of the morbidity associated with these compounds arises from the acute effects related to Hallucinogen Intoxication. Hallucinogen Dependence is rare and Hallucinogen Withdrawal is not described. Among the mental disorders related to hallucinogen use, Hallucinogen-Induced Psychotic Disorder is the most frequently seen, although worldwide it is still fairly uncommon.

6C49.0 Episode of harmful use of hallucinogens

An episode of hallucinogen use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to hallucinogen intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of hallucinogen use.

Exclusions: Hallucinogen dependence (6C49.2)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.1 Harmful pattern of use of hallucinogens

A pattern of use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of hallucinogen use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.

Exclusions: Hallucinogen dependence (6C49.2)

Episode of harmful use of hallucinogens (6C49.0)

6C49.10 Harmful pattern of use of hallucinogens, episodic

A pattern of episodic or intermittent use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic hallucinogen use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Hallucinogen dependence (6C49.2)

6C49.11 Harmful pattern of use of hallucinogens, continuous

A pattern of continuous (daily or almost daily) use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous hallucinogen use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful use of hallucinogens applies.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Hallucinogen dependence (6C49.2)

6C49.1Z Harmful pattern of use of hallucinogens, unspecified

6C49.2 Hallucinogen dependence

Hallucinogen dependence is a disorder of regulation of hallucinogen use arising from repeated or continuous use of hallucinogens. The characteristic feature is a strong internal drive to use hallucinogens, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use hallucinogens. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if hallucinogens use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.20 Hallucinogen dependence, current use

Current hallucinogen dependence with hallucinogen use within the past month.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.21 Hallucinogen dependence, early full remission

After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from hallucinogens during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.22 Hallucinogen dependence, sustained partial remission

After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in hallucinogen consumption for more than 12 months, such that even though intermittent or continuing hallucinogen use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.23 Hallucinogen dependence, sustained full remission

After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from hallucinogens for 12 months or longer.

Exclusions: Episode of harmful use of hallucinogens (6C49.0)

Harmful pattern of use of hallucinogens (6C49.1)

6C49.2Z Hallucinogen dependence, unspecified

6C49.3 Hallucinogen intoxication

Hallucinogen intoxication is a clinically significant transient condition that develops during or shortly after the consumption of hallucinogens that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of hallucinogens and their intensity is closely related to the amount of hallucinogen consumed. They are time-limited and abate as the hallucinogen is cleared from the body. Presenting features may include hallucinations, illusions, perceptual changes such as depersonalisation, derealization, or synesthesias (blending of senses, such as a visual stimulus evoking a smell), anxiety, depressed or dysphoric mood, ideas of reference, paranoid ideation, impaired judgment, palpitations, sweating, blurred vision, tremors and incoordination. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, hallucinogen intoxication may facilitate suicidal ideation and behaviour.

Coding Note: Code also the causing condition

Exclusions: hallucinogens poisoning (NE60)

Possession trance disorder (6B63)

6C49.4 Hallucinogen-induced delirium

Hallucinogen-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of hallucinogens. The amount and duration of hallucinogen use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C49.5 Hallucinogen-induced psychotic disorder

Hallucinogen-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with hallucinogen use).

Coding Note: Code also the causing condition

Exclusions: Psychotic disorder induced by other specified psychoactive substance (6C4E.6)

Alcohol-induced psychotic disorder (6C40.6)

6C49.6 Certain specified hallucinogen-induced mental or behavioural disorders

Coding Note: Code also the causing condition

6C49.60 Hallucinogen-induced mood disorder

Hallucinogen-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with hallucinogen use).

Coding Note: Code also the causing condition

6C49.61 Hallucinogen-induced anxiety disorder

Hallucinogen-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with hallucinogen use).

Coding Note: Code also the causing condition

6C49.Y **Other specified disorders due to use of hallucinogens**

6C49.Z **Disorders due to use of hallucinogens, unspecified**

6C4A Disorders due to use of nicotine

Disorders due to use of nicotine are characterised by the pattern and consequences of nicotine use. Nicotine is the active dependence-producing constituent of the tobacco plant, Nicotiana tabacum. Nicotine is used overwhelmingly through smoking cigarettes. Increasingly, it is also used in electronic cigarettes that vaporize nicotine dissolved in a carrier solvent for inhalation (i.e., “vaping”). Pipe smoking, chewing tobacco and inhaling snuff are minor forms of use. Nicotine is a highly potent addictive compound and is the third most common psychoactive substance used worldwide after caffeine and alcohol. Nicotine Dependence and Nicotine Withdrawal are well described and Nicotine-Induced Mental Disorders are recognized.

6C4A.0 **Episode of harmful use of nicotine**

An episode of nicotine use that has caused damage to a person’s physical or mental health. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of nicotine use.

Exclusions: Nicotine dependence (6C4A.2)

Harmful pattern of use of nicotine (6C4A.1)

Harmful effects of or exposure to noxious substances, chiefly nonmedicinal as to source, not elsewhere classified (NE61)

6C4A.1 Harmful pattern of use of nicotine

A pattern of nicotine use that has caused damage to a person's physical or mental health. The pattern of nicotine use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

Exclusions: Nicotine dependence (6C4A.2)

Episode of harmful use of nicotine (6C4A.0)

6C4A.10 Harmful pattern of use of nicotine, episodic

A pattern of episodic or intermittent nicotine use that has caused damage to a person's physical or mental health. The pattern of episodic nicotine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Nicotine dependence (6C4A.2)

6C4A.11 Harmful pattern of use of nicotine, continuous

A pattern of continuous (daily or almost daily) nicotine use that has caused damage to a person's physical or mental health. The pattern of continuous nicotine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Nicotine dependence (6C4A.2)

6C4A.1Z Harmful pattern of use of nicotine, unspecified

6C4A.2 Nicotine dependence

Nicotine dependence is a disorder of regulation of nicotine use arising from repeated or continuous use of nicotine. The characteristic feature is a strong internal drive to use nicotine, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use nicotine. Physiological features of dependence may also be present, including tolerance to the effects of nicotine, withdrawal symptoms following cessation or reduction in use of nicotine, or repeated use of nicotine or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if nicotine use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Harmful pattern of use of nicotine (6C4A.1)

6C4A.20 Nicotine dependence, current use

Current nicotine dependence with nicotine use within the past month.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Harmful pattern of use of nicotine (6C4A.1)

6C4A.21 Nicotine dependence, early full remission

After a diagnosis of nicotine dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from nicotine during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Harmful pattern of use of nicotine (6C4A.1)

6C4A.22 Nicotine dependence, sustained partial remission

After a diagnosis of nicotine dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in nicotine consumption for more than 12 months, such that even though intermittent or continuing nicotine use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Harmful pattern of use of nicotine (6C4A.1)

6C4A.23 Nicotine dependence, sustained full remission

After a diagnosis of nicotine dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from nicotine for 12 months or longer.

Exclusions: Episode of harmful use of nicotine (6C4A.0)

Harmful pattern of use of nicotine (6C4A.1)

6C4A.2Z Nicotine dependence, unspecified

6C4A.3 Nicotine intoxication

Nicotine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of nicotine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of nicotine and their intensity is closely related to the amount of nicotine consumed. They are time-limited and abate as nicotine is cleared from the body. Presenting features may include restlessness, psychomotor agitation, anxiety, cold sweats, headache, insomnia, palpitations, paresthesias, nausea or vomiting, abdominal cramps, confusion, bizarre dreams, burning sensations in the mouth, and salivation. In rare instances, paranoid ideation, perceptual disturbances, convulsions or coma may occur. Nicotine intoxication occurs more commonly in naïve (non-tolerant) users or among those taking higher than accustomed doses.

Coding Note: Code also the causing condition

Inclusions: "Bad trips" due to nicotine

Exclusions: intoxication meaning poisoning (NE61)

Possession trance disorder (6B63)

6C4A.4 **Nicotine withdrawal**

Nicotine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of nicotine (typically used as a constituent of tobacco) in individuals who have developed Nicotine dependence or have used nicotine for a prolonged period or in large amounts. Presenting features of Nicotine withdrawal may include dysphoric or depressed mood, insomnia, irritability, anger, anxiety, difficulty concentrating, restlessness, bradycardia, increased appetite, and craving for tobacco (or other nicotine-containing products. Other physical symptoms may include increased cough and mouth ulceration.

Coding Note: Code also the causing condition

6C4A.Y **Other specified disorders due to use of nicotine**

6C4A.Z **Disorders due to use of nicotine, unspecified**

6C4B Disorders due to use of volatile inhalants

Disorders due to use of volatile inhalants are characterised by the pattern and consequences of volatile inhalant use. Volatile inhalants include a range of compounds that are in the gaseous or vapour phase at ambient temperatures and include various organic solvents, glues, gasoline (petrol), nitrites and gases such as nitrous oxide, trichloroethane, butane, toluene, fluorocarbons, ether and halothane. They have a range of pharmacological properties but are predominantly central nervous system depressants, with many also having vasoactive effects. They tend to be used by younger persons and may be used when access to alternative psychoactive substances is difficult or impossible. Volatile Inhalant Intoxication is well recognized. Volatile inhalants have dependence-producing properties and Volatile Inhalant Dependence and Volatile Inhalant Withdrawal is recognized although comparatively uncommon worldwide. Volatile Inhalant-Induced Mental Disorders are described. They may also cause neurocognitive impairment, including Dementia.

6C4B.0 **Episode of harmful use of volatile inhalants**

An episode of volatile inhalant use or unintentional exposure (e.g., occupational exposure) that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to volatile inhalant intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of volatile inhalant use.

Exclusions: Harmful pattern of use of volatile inhalants (6C4B.1)

Volatile inhalant dependence (6C4B.2)

6C4B.1 **Harmful pattern of use of volatile inhalants**

A pattern of volatile inhalant use of that has caused damage to a person's physical or mental health. The pattern of volatile inhalant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

Exclusions: Volatile inhalant dependence (6C4B.2)

Episode of harmful use of volatile inhalants (6C4B.0)

6C4B.10 Harmful pattern of use of volatile inhalants, episodic

A pattern of episodic or intermittent volatile inhalant use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic volatile inhalant use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Volatile inhalant dependence (6C4B.2)

6C4B.11 Harmful pattern of use of volatile inhalants, continuous

A pattern of continuous (daily or almost daily) volatile inhalant use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous volatile inhalant use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Volatile inhalant dependence (6C4B.2)

6C4B.1Z Harmful pattern of use of volatile inhalants, unspecified

6C4B.2 Volatile inhalant dependence

Volatile inhalant dependence is a disorder of regulation of volatile inhalant use arising from repeated or continuous use of volatile inhalants. The characteristic feature is a strong internal drive to use volatile inhalants, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use volatile inhalants. Physiological features of dependence may also be present, including tolerance to the effects of volatile inhalants, withdrawal symptoms following cessation or reduction in use of volatile inhalants, or repeated use of volatile inhalants or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if volatile inhalant use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Harmful pattern of use of volatile inhalants (6C4B.1)

6C4B.20 Volatile inhalant dependence, current use

Current volatile inhalant dependence with volatile inhalant use within the past month.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Harmful pattern of use of volatile inhalants (6C4B.1)

6C4B.21 Volatile inhalant dependence, early full remission

After a diagnosis of volatile inhalant dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from volatile inhalants during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Harmful pattern of use of volatile inhalants (6C4B.1)

6C4B.22 Volatile inhalant dependence, sustained partial remission

After a diagnosis of Volatile inhalant dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in volatile inhalant consumption for more than 12 months, such that even though intermittent or continuing volatile inhalant use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Harmful pattern of use of volatile inhalants (6C4B.1)

6C4B.23 Volatile inhalant dependence, sustained full remission

After a diagnosis of Volatile inhalant dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from volatile inhalants for 12 months or longer.

Exclusions: Episode of harmful use of volatile inhalants (6C4B.0)

Harmful pattern of use of volatile inhalants (6C4B.1)

6C4B.2Z Volatile inhalant dependence, unspecified

6C4B.3 Volatile inhalant intoxication

Volatile inhalant intoxication is a clinically significant transient condition that develops during or shortly after the consumption of a volatile inhalant that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of volatile inhalants and their intensity is closely related to the amount of volatile inhalant consumed. They are time-limited and abate as the volatile inhalant is cleared from the body. Presenting features may include euphoria, impaired judgment, aggression, somnolence, stupor or coma, dizziness, tremor, lack of coordination, slurred speech, unsteady gait, lethargy and apathy, psychomotor retardation, and visual disturbances. Muscle weakness and diplopia may occur. Use of volatile inhalants may cause cardiac arrhythmia, cardiac arrest, and death. Inhalants containing lead (e.g. some forms of petrol/gasoline) may cause confusion, irritability, coma and seizures.

Coding Note: Code also the causing condition

Exclusions: Possession trance disorder (6B63)

6C4B.4 Volatile inhalant withdrawal

Volatile inhalant withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of volatile inhalants in individuals who have developed Volatile inhalant dependence or have used volatile inhalants for a prolonged period or in large amounts. Presenting features of Volatile inhalant withdrawal may include insomnia, anxiety, irritability, dysphoric mood, shakiness, perspiration, nausea, and transient illusions.

Coding Note: Code also the causing condition

6C4B.5 Volatile inhalant-induced delirium

Volatile inhalant-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of volatile inhalants. The amount and duration of volatile inhalant use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6C4B.6 **Volatile inhalant-induced psychotic disorder**

Volatile inhalant-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganized thinking, grossly disorganized behaviour) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with volatile inhalant use).

Coding Note: Code also the causing condition

6C4B.7 **Certain specified volatile inhalants-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C4B.70 Volatile inhalant-induced mood disorder

Volatile inhalant-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with volatile inhalant use).

Coding Note: Code also the causing condition

6C4B.71 Volatile inhalant-induced anxiety disorder

Volatile inhalant-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with volatile inhalant use).

Coding Note: Code also the causing condition

6C4B.Y **Other specified disorders due to use of volatile inhalants**

6C4B.Z **Disorders due to use of volatile inhalants, unspecified**

6C4C Disorders due to use of MDMA or related drugs, including MDA

Disorders due to use of MDMA or related drugs, including MDA are characterised by the pattern and consequences of MDMA or related drug use. MDMA is methylene-dioxymethamphetamine and is a common drug of abuse in many countries especially among young people. It is predominantly available in tablet form known as 'ecstasy'. Pharmacologically, MDMA has stimulant and empathogenic properties and these encourage its use among young people for social and other interactions. Considering its wide prevalence in many countries and among many sub-groups of young people, MDMA and Related Drug Dependence and MDMA and Related Drug Withdrawal are comparatively uncommon. Substance-Induced Mental Disorders may arise from its use. Several analogues of MDMA exist, including MDA (methylene-dioxyamphetamine).

Exclusions: Hazardous use of MDMA or related drugs (QE11.6)

6C4C.0 **Episode of harmful use of MDMA or related drugs, including MDA**

An episode of use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with MDMA or related drugs, including MDA, on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of MDMA or related drugs, including MDA.

Exclusions: Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

MDMA or related drug dependence, including MDA (6C4C.2)

6C4C.1 **Harmful pattern of use of MDMA or related drugs, including MDA**

A pattern of use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of use of MDMA or related drugs is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

Exclusions: MDMA or related drug dependence, including MDA (6C4C.2)

Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

6C4C.10 Harmful use of MDMA or related drugs, including MDA, episodic

A pattern of episodic or intermittent use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic use of MDMA or related drugs is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

MDMA or related drug dependence, including MDA (6C4C.2)

6C4C.11 Harmful use of MDMA or related drugs, including MDA, continuous

A pattern of continuous (daily or almost daily) use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous use of MDMA or related drugs is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

MDMA or related drug dependence, including MDA (6C4C.2)

6C4C.1Z Harmful pattern of use of MDMA or related drugs, including MDA, unspecified

6C4C.2 **MDMA or related drug dependence, including MDA**

MDMA or related drug dependence, including MDA is a disorder of regulation of MDMA or related drug use arising from repeated or continuous use of MDMA or related drugs. The characteristic feature is a strong internal drive to use MDMA or related drugs, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use MDMA or related drugs. Physiological features of dependence may also be present, including tolerance to the effects of MDMA or related drugs, withdrawal symptoms following cessation or reduction in use of MDMA or related drugs, or repeated use of MDMA or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if MDMA or related drug use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

6C4C.20 MDMA or related drug dependence, including MDA, current use

Current MDMA or related drug dependence, including MDA, with MDMA or related drug use within the past month.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

6C4C.21 MDMA or related drug dependence, including MDA, early full remission

After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from MDMA or related drug dependence, including MDA, during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

6C4C.22 MDMA or related drug dependence, including MDA, sustained partial remission

After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of MDMA or related drugs, including MDA, for more than 12 months, such that even though intermittent or continuing use of MDMA or related drugs, including MDA, has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

6C4C.23 MDMA or related drug dependence, including MDA, sustained full remission

After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from MDMA or related drugs, including MDA, for 12 months or longer.

Exclusions: Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

6C4C.2Z MDMA or related drug dependence, including MDA, unspecified

6C4C.3 **MDMA or related drug intoxication, including MDA**

MDMA or related drug intoxication, including MDA is a clinically significant transient condition that develops during or shortly after the consumption of MDMA or related drugs that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of MDMA or related drugs and their intensity is closely related to the amount of MDMA or a related drug consumed. They are time-limited and abate as MDMA or a related drug is cleared from the body. Presenting features may include increased or inappropriate sexual interest and activity, anxiety, restlessness, agitation, and sweating. In rare instances, usually in severe intoxication, use of MDMA or related drugs, including MDA can result in dystonia and seizures. Sudden death is a rare but recognised complication.

Coding Note: Code also the causing condition

6C4C.4 **MDMA or related drug withdrawal, including MDA**

MDMA or related drug withdrawal, including MDA is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of MDMA or related drugs in individuals who have developed MDMA or related drug dependence or have used MDMA or related drugs for a prolonged period or in large amounts. Presenting features of MDMA or related drug withdrawal may include fatigue, lethargy, hypersomnia or insomnia, depressed mood, anxiety, irritability, craving, difficulty in concentrating, and appetite disturbance.

Coding Note: Code also the causing condition

6C4C.5 **MDMA or related drug-induced delirium, including MDA**

MDMA or related drug-induced delirium, including MDA is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of MDMA or related drugs. The amount and duration of MDMA or related drug use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C4C.6 **MDMA or related drug-induced psychotic disorder, including MDA**

MDMA or related drug-induced psychotic disorder, including MDA is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of MDMA or related drug intoxication. The amount and duration of MDMA or related drug use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use, including MDA).

Coding Note: Code also the causing condition

6C4C.7 **Certain specified MDMA or related drug-induced mental or behavioural disorders, including MDA**

Coding Note: Code also the causing condition

6C4C.70 MDMA or related drug-induced mood disorder, including MDA

MDMA or related drug-induced mood disorder, including MDA is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of MDMA or related drug intoxication, including MDA. The amount and duration of MDMA or related drug use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use).

Coding Note: Code also the causing condition

6C4C.71 MDMA or related drug-induced anxiety disorder

MDMA or related drug-induced anxiety disorder, including MDA is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of MDMA or related drug intoxication, including MDA. The amount and duration of MDMA or related drug use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use).

Coding Note: Code also the causing condition

6C4C.Y **Other specified disorders due to use of MDMA or related drugs, including MDA**

6C4C.Z **Disorders due to use of MDMA or related drugs, including MDA, unspecified**

6C4D Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP]

Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP] are characterised by the pattern and consequences of dissociative drug use. Dissociative drugs include ketamine and phencyclidine (PCP) and their (comparatively rare) chemical analogues. Ketamine is an intravenous anaesthetic widely used in low- and middle-income countries, particularly in Africa, and in emergency situations. Ketamine is also undergoing evaluation for treatment of some mental disorders (e.g., treatment resistant Depressive Disorders). It is also a widespread drug of nonmedical use in many countries and may be taken by the oral or nasal routes or injected. It produces a sense of euphoria but depending on the dose, emergent hallucinations and dissociation are recognised as unpleasant side effects. Phencyclidine has a more restricted worldwide distribution and also has euphoric and dissociative effects. Its use may result in bizarre behaviour uncharacteristic for the individual, including self-harm. Dissociative Drug Dependence is described but a withdrawal syndrome is not recognized by most authorities. Several Dissociative Drug-Induced Mental Disorders are recognised.

Exclusions: Hazardous use of dissociative drugs including ketamine or PCP (QE11.7)

6C4D.0 Episode of harmful use of dissociative drugs including ketamine or PCP

An episode of use of a dissociative drug, including Ketamine and PCP, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with a dissociative drug, including Ketamine and PCP, on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of dissociative drugs, including Ketamine and PCP.

Exclusions: Dissociative drug dependence including ketamine or PCP (6C4D.2)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.1 Harmful pattern of use of dissociative drugs, including ketamine or PCP

A pattern of use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of dissociative drug use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.

Exclusions: Dissociative drug dependence including ketamine or PCP (6C4D.2)

Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

6C4D.10 Harmful pattern of use of dissociative drugs including ketamine or PCP, episodic

A pattern of episodic or intermittent use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic use of dissociative drugs is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Dissociative drug dependence including ketamine or PCP (6C4D.2)

6C4D.11 Harmful pattern of use of dissociative drugs including ketamine or PCP, continuous

A pattern of continuous (daily or almost daily) use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous use of dissociative drugs is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Dissociative drug dependence including ketamine or PCP (6C4D.2)

6C4D.1Z Harmful pattern of use of dissociative drugs, including ketamine or PCP, unspecified

6C4D.2 **Dissociative drug dependence including ketamine or PCP**

Dissociative drug dependence including ketamine or PCP is a disorder of regulation of dissociative drug use arising from repeated or continuous use of dissociative drugs. The characteristic feature is a strong internal drive to use dissociative drugs, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use dissociative drugs. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if dissociative drugs use is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.20 Dissociative drug dependence including Ketamine or PCP, current use

Dissociative drug dependence including Ketamine and PCP, current use refers to use of dissociative drugs within the past month.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.21 Dissociative drug dependence including Ketamine or PCP, early full remission

After a diagnosis of Dissociative drug dependence including Ketamine and PCP, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from dissociative drugs during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.22 Dissociative drug dependence including Ketamine or PCP, sustained partial remission

After a diagnosis of Dissociative drug dependence including Ketamine and PCP, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in dissociative drug consumption for more than 12 months, such that even though intermittent or continuing dissociative drug use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.23 Dissociative drug dependence including Ketamine or PCP, sustained full remission

After a diagnosis of Dissociative drug dependence including Ketamine and PCP, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from dissociative drugs for 12 months or longer.

Exclusions: Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

6C4D.2Z Dissociative drug dependence including ketamine or PCP, unspecified

6C4D.3 Dissociative drug intoxication including Ketamine or PCP

Dissociative drug intoxication including Ketamine and PCP is a clinically significant transient condition that develops during or shortly after the consumption of a dissociative drug that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of a dissociative drug and their intensity is closely related to the amount of the dissociative drug consumed. They are time-limited and abate as the dissociative drug is cleared from the body. Presenting features may include aggression, impulsiveness, unpredictability, anxiety, psychomotor agitation, impaired judgment, numbness or diminished responsiveness to pain, slurred speech, and dystonia. Physical signs include nystagmus (repetitive, uncontrolled eye movements), tachycardia, elevated blood pressure, numbness, ataxia, dysarthria, and muscle rigidity. In rare instances, use of dissociative drugs including Ketamine and PCP can result in seizures.

Coding Note: Code also the causing condition

6C4D.4 Dissociative drug-induced delirium including ketamine or PCP

Dissociative drug-induced delirium including Ketamine or PCP is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of dissociative drugs. The amount and duration of dissociative drug use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C4D.5 **Dissociative drug-induced psychotic disorder including Ketamine or PCP**

Dissociative drug-induced psychotic disorder including Ketamine or PCP is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with dissociative drugs. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Dissociative drug intoxication. The amount and duration of Dissociative drug use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the dissociative drug use, if the symptoms persist for a substantial period of time after cessation of the dissociative drug use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with dissociative drug use).

Coding Note: Code also the causing condition

6C4D.6 **Certain specified dissociative drugs -induced mental or behavioural disorders, including ketamine and phencyclidine [PCP]**

Coding Note: Code also the causing condition

6C4D.60 Dissociative drug-induced mood disorder including Ketamine or PCP

Dissociative drug-induced mood disorder including Ketamine or PCP is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with dissociative drugs. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Dissociative drug intoxication. The amount and duration of Dissociative drug use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the dissociative drug use, if the symptoms persist for a substantial period of time after cessation of the dissociative drug use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with dissociative drug use).

Coding Note: Code also the causing condition

6C4D.61 Dissociative drug-induced anxiety disorder including Ketamine or PCP

Dissociative drug-induced anxiety disorder including Ketamine or PCP is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with dissociative drugs. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Dissociative drug intoxication. The amount and duration of Dissociative drug use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the dissociative drug use, if the symptoms persist for a substantial period of time after cessation of the dissociative drug use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with dissociative drug use).

Coding Note: Code also the causing condition

6C4D.Y **Other specified disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP]**

6C4D.Z **Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP], unspecified**

6C4E Disorders due to use of other specified psychoactive substances, including medications

Disorders due to use of other specified psychoactive substances, including medications are characterised by the pattern and consequences of psychoactive substances that are not included among the major substance classes specifically identified. Examples include khat, anabolic steroids, corticosteroids, antidepressants, medications with anticholinergic properties (e.g., benztropine), and some antihistamines.

6C4E.0 **Episode of harmful use of other specified psychoactive substance**

An episode of use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of single episode of harmful use of other specified psychoactive substance applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the specified psychoactive substance.

Exclusions: Harmful pattern of use of other specified psychoactive substance (6C4E.1)

Other specified psychoactive substance dependence (6C4E.2)

6C4E.1 **Harmful pattern of use of other specified psychoactive substance**

A pattern of use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

Exclusions: Other specified psychoactive substance dependence (6C4E.2)

Episode of harmful use of other specified psychoactive substance (6C4E.0)

6C4E.10 Harmful pattern of use of other specified psychoactive substance, episodic

A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Abuse that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Other specified psychoactive substance dependence (6C4E.2)

6C4E.11 Harmful pattern of use of other specified psychoactive substance, continuous

A pattern of continuous (daily or almost daily) use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Other specified psychoactive substance dependence (6C4E.2)

6C4E.1Z Harmful pattern of use of other specified psychoactive substance, unspecified

6C4E.2 Other specified psychoactive substance dependence

Other specified psychoactive substance dependence is a disorder of regulation of use of a specified substance arising from repeated or continuous use of the specified substance. The characteristic feature is a strong internal drive to use the specified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substance. Physiological features of dependence may also be present, including tolerance to the effects of the specified substance, withdrawal symptoms following cessation or reduction in use of the specified substance, or repeated use of the specified substance or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substance is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Harmful pattern of use of other specified psychoactive substance (6C4E.1)

6C4E.20 Other specified psychoactive substance dependence, current use

Current Other specified psychoactive substance dependence, with use of the specified psychoactive substance within the past month.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Harmful pattern of use of other specified psychoactive substance (6C4E.1)

6C4E.21 Other specified psychoactive substance dependence, early full remission

After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the specified substance during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Harmful pattern of use of other specified psychoactive substance (6C4E.1)

6C4E.22 Other specified psychoactive substance dependence, sustained partial remission

After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the specified substance for more than 12 months, such that even though intermittent or continuing substance use has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Harmful pattern of use of other specified psychoactive substance (6C4E.1)

6C4E.23 Other specified psychoactive substance dependence, sustained full remission

After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the specified substance for 12 months or longer.

Exclusions: Episode of harmful use of other specified psychoactive substance (6C4E.0)

Harmful pattern of use of other specified psychoactive substance (6C4E.1)

6C4E.2Z Other specified psychoactive substance dependence, unspecified

6C4E.3 Other specified psychoactive substance intoxication

Other specified psychoactive substance intoxication is a clinically significant transient condition that develops during or shortly after the consumption of a specified psychoactive substance or medication that is characterised by disturbances in level of consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of the specified psychoactive substance and their intensity is closely related to the amount of the specified psychoactive substance consumed. They are time-limited and abate as the specified substance is cleared from the body.

Coding Note: Code also the causing condition

6C4E.4 **Other specified psychoactive substance withdrawal**

Other specified psychoactive substance withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of the specified substance in individuals who have developed dependence or have used the specified substance for a prolonged period or in large amounts. Other specified psychoactive substance withdrawal can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the specified substance.

Coding Note: Code also the causing condition

6C4E.40 Other specified psychoactive substance withdrawal, uncomplicated

The development of a withdrawal state not accompanied by perceptual disturbances or seizures following cessation or reduction of use of the specified substance.

Coding Note: Code also the causing condition

6C4E.41 Other specified psychoactive substance withdrawal, with perceptual disturbances

The development of a withdrawal state accompanied by perceptual disturbances but not by seizures following cessation or reduction of use of the specified substance.

Coding Note: Code also the causing condition

6C4E.42 Other specified psychoactive substance withdrawal, with seizures

The development of a withdrawal state accompanied by seizures but not by perceptual disturbances following cessation or reduction of use of the specified substance.

Coding Note: Code also the causing condition

6C4E.43 Other specified psychoactive substance withdrawal, with perceptual disturbances and seizures

The development of a withdrawal state accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the specified substance.

Coding Note: Code also the causing condition

6C4E.4Z Other specified psychoactive substance withdrawal, unspecified

Coding Note: Code also the causing condition

6C4E.5 **Delirium induced by other specified psychoactive substance including medications**

Delirium induced by other specified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of a specified psychoactive substance. The amount and duration of use of the specified substance must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C4E.6 **Psychotic disorder induced by other specified psychoactive substance**

Psychotic disorder induced by other specified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

Coding Note: Code also the causing condition

6C4E.7 **Certain other specified psychoactive substance-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C4E.70 Mood disorder induced by other specified psychoactive substance

Mood disorder induced by other specified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

Coding Note: Code also the causing condition

6C4E.71 Anxiety disorder induced by other specified psychoactive substance

Anxiety disorder induced by other specified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

Coding Note: Code also the causing condition

6C4E.72 Obsessive-compulsive or related disorder induced by other specified psychoactive substance

Obsessive-compulsive or related disorder induced by other specified psychoactive substance is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of intoxication with or withdrawal from the specified psychoactive substance. The amount and duration of the specified psychoactive substance use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the specified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with specified psychoactive substance use).

Coding Note: Code also the causing condition

6C4E.73 Impulse control disorder induced by other specified psychoactive substance

Impulse control disorder induced by other specified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of intoxication with or withdrawal from the specified psychoactive substance. The amount and duration of the specified psychoactive substance use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the specified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with specified psychoactive substance use).

Coding Note: Code also the causing condition

6C4E.Y **Other specified disorders due to use of other specified psychoactive substances, including medications**

6C4E.Z **Disorders due to use of other specified psychoactive substances, including medications, unspecified**

6C4F Disorders due to use of multiple specified psychoactive substances, including medications

Disorders due to use of multiple specified psychoactive substances, including medications are characterised by the pattern and consequences of multiple psychoactive substances. Although this grouping is provided for coding purposes, in most clinical situations it is recommended that multiple specific disorders due to substance use be assigned rather than using categories from this grouping.

6C4F.0 Episode of harmful use of multiple specified psychoactive substances

An episode of use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorder Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of single episode of harmful use of multiple specified psychoactive substances applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the multiple psychoactive substances.

Exclusions:

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

Multiple specified psychoactive substances dependence (6C4F.2)

6C4F.1 Harmful pattern of use of multiple specified psychoactive substances

A pattern of use of a multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of use of multiple specified psychoactive substances applies.

Exclusions:

Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Multiple specified psychoactive substances dependence (6C4F.2)

6C4F.10 Harmful pattern of use of multiple specified psychoactive substances, episodic

A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Multiple specified psychoactive substances dependence (6C4F.2)

6C4F.11 Harmful pattern of use of multiple specified psychoactive substances, continuous

A pattern of continuous (daily or almost daily) use of a multiple specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of multiple specified psychoactive substances applies.

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Multiple specified psychoactive substances dependence (6C4F.2)

6C4F.1Z Harmful pattern of use of multiple specified psychoactive substances, unspecified

6C4F.2 Multiple specified psychoactive substances dependence

Multiple specified psychoactive substance dependence is a disorder of regulation of use of multiple specified substances arising from repeated or continuous use of the specified substances. The characteristic feature is a strong internal drive to use the specified substances, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substances. Physiological features of dependence may also be present, including tolerance to the effects of the specified substances, withdrawal symptoms following cessation or reduction in use of the specified substances, or repeated use of the specified substances or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substances is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

6C4F.20 Multiple specified psychoactive substances dependence, current use

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

6C4F.21 Multiple specified psychoactive substances dependence, early full remission

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

6C4F.22 Multiple specified psychoactive substances dependence, sustained partial remission

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

6C4F.23 Multiple specified psychoactive substances dependence, sustained full remission

Exclusions: Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

6C4F.2Z Multiple specified psychoactive substances dependence, unspecified

6C4F.3 **Intoxication due to multiple specified psychoactive substances**

Intoxication due to multiple specified psychoactive substances is a clinically significant transient condition that develops during or shortly after the consumption of multiple specified substances or medications that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of the multiple specified psychoactive substances and their intensity is closely related to the amount of the substances consumed. They are time-limited and abate as the multiple specified substances are cleared from the body.

Coding Note: Code also the causing condition

6C4F.4 **Multiple specified psychoactive substances withdrawal**

Multiple specified psychoactive substance withdrawal is a clinically significant cluster of symptoms, behaviours and physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of multiple specified substances in individuals who have developed dependence or have used the specified substances for a prolonged period or in large amounts. Multiple specified psychoactive substance withdrawal can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the specified substances and their interactions.

Coding Note: Code also the causing condition

6C4F.40 Multiple specified psychoactive substances withdrawal, uncomplicated

Coding Note: Code also the causing condition

6C4F.41 Multiple specified psychoactive substances withdrawal, with perceptual disturbances

Coding Note: Code also the causing condition

6C4F.42 Multiple specified psychoactive substances withdrawal, with seizures

Coding Note: Code also the causing condition

6C4F.43 Multiple specified psychoactive substances withdrawal, with perceptual disturbances and seizures

Coding Note: Code also the causing condition

6C4F.4Y Other specified multiple specified psychoactive substances withdrawal

Coding Note: Code also the causing condition

6C4F.4Z Multiple specified psychoactive substances withdrawal, unspecified

Coding Note: Code also the causing condition

6C4F.5 **Delirium induced by multiple specified psychoactive substances including medications**

Delirium induced by multiple specified psychoactive substances is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of multiple specified substances. The amount and duration of use of the multiple specified substances must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a substance other than those specified, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders. Note that this diagnosis applies only to those situations in which delirium is present but it cannot be determined which of multiple psychoactive substances is the cause of the delirium. In cases of multiple psychoactive substance use in which more than one specific substance can be identified as a cause of the delirium, the corresponding specific substance-induced delirium diagnoses should be given instead.

Coding Note: Code also the causing condition

6C4F.6 **Psychotic disorder induced by multiple specified psychoactive substances**

Psychotic disorder induced by multiple specified psychoactive substances is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

Coding Note: Code also the causing condition

6C4F.7 **Certain multiple specified psychoactive substances-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C4F.70 Mood disorder induced by multiple specified psychoactive substances

Mood disorder induced by multiple specified psychoactive substances is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

Coding Note: Code also the causing condition

6C4F.71 Anxiety disorder induced by multiple specified psychoactive substances

Anxiety disorder induced by multiple specified psychoactive substances is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

Coding Note: Code also the causing condition

6C4F.72 Obsessive-compulsive or related disorder induced by multiple specified psychoactive substances

Obsessive-compulsive or related disorder induced by multiple specified psychoactive substances is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of intoxication with or withdrawal from the multiple specified psychoactive substances. The amount and duration of the multiple specified psychoactive substances use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the use of multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the multiple specified psychoactive substance use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with multiple specified psychoactive substances use).

Coding Note: Code also the causing condition

6C4F.73 Impulse control syndrome induced by multiple specified psychoactive substances

Impulse control disorder induced by multiple specified psychoactive substances is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of intoxication with or withdrawal from the multiple specified psychoactive substances. The amount and duration of the multiple specified psychoactive substances use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the use of multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the multiple specified psychoactive substance use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with multiple specified psychoactive substances use).

Coding Note: Code also the causing condition

6C4F.Y **Other specified disorders due to use of multiple specified psychoactive substances, including medications**

6C4F.Z **Disorders due to use of multiple specified psychoactive substances, including medications, unspecified**

6C4G Disorders due to use of unknown or unspecified psychoactive substances

Disorders due to use of unknown or unspecified psychoactive substances are characterised by the pattern and consequences of psychoactive substance use when the specific substance is unknown or unspecified. These categories may be used in clinical situations in which it is clear that the disturbance is due to substance use but the specific class of substance is unknown. Once the relevant substance is identified, the disturbance should be recoded under the appropriate substance class.

6C4G.0 Episode of harmful use of unknown or unspecified psychoactive substances

An episode of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication or withdrawal; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to substance intoxication or withdrawal on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the unknown or unspecified psychoactive substance.

Exclusions:

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

Unknown or unspecified psychoactive substance dependence (6C4G.2)

6C4G.1 Harmful pattern of use of unknown or unspecified psychoactive substance

A pattern of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

Exclusions:

Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Unknown or unspecified psychoactive substance dependence (6C4G.2)

6C4G.10 Harmful pattern of use of unknown or unspecified psychoactive substance, episodic

A pattern of episodic or intermittent use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Unknown or unspecified psychoactive substance dependence (6C4G.2)

6C4G.11 Harmful pattern of use of unknown or unspecified psychoactive substance, continuous

A pattern of continuous (daily or almost daily) use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Unknown or unspecified psychoactive substance dependence (6C4G.2)

6C4G.1Z Harmful pattern of use of unknown or unspecified psychoactive substance, unspecified

6C4G.2 **Unknown or unspecified psychoactive substance dependence**

Unknown or unspecified psychoactive substance dependence is a disorder of regulation of use of an unknown or unspecified substance arising from repeated or continuous use of the substance. The characteristic feature is a strong internal drive to use the unknown or unspecified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the unknown or unspecified substance. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the unknown or unspecified substance is continuous (daily or almost daily) for at least 3 months.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

6C4G.20 Unknown or unspecified psychoactive substance dependence, current use

Current dependence on an unknown or unspecified psychoactive substance, with use of the substance within the past month.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

6C4G.21 Unknown or unspecified psychoactive substance dependence, early full remission

After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the substance during a period lasting from between 1 and 12 months.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

6C4G.22 Unknown or unspecified psychoactive substance dependence, sustained partial remission

After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the substance for more than 12 months, such that even though intermittent or continuing use of the substance has occurred during this period, the definitional requirements for dependence have not been met.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

6C4G.23 Unknown or unspecified psychoactive substance dependence, sustained full remission

After a diagnosis of Unknown or unspecified psychoactive substance dependence, sustained full remission, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the substance for 12 months or longer.

Exclusions: Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

6C4G.2Z Unknown or unspecified psychoactive substance dependence, substance and state of remission unspecified

6C4G.3 **Intoxication due to unknown or unspecified psychoactive substance**

Intoxication due to unknown or unspecified psychoactive substance is a transient condition that develops during or shortly after the administration of an unknown or unspecified psychoactive substance that is characterised by disturbances in level of consciousness, cognition, perception, affect or behaviour, or other psychophysiological functions and responses. This diagnosis should be made only when there is strong evidence that an unidentified substance has been taken and the features cannot be accounted for by another disorder or disease.

Coding Note: Code also the causing condition

6C4G.4 **Withdrawal due to unknown or unspecified psychoactive substance**

Withdrawal due to unknown or unspecified psychoactive substance is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of an unknown or unspecified substance in individuals who have developed dependence or have used the unknown or unspecified substance for a prolonged period or in large amounts. Withdrawal due to unknown or unspecified psychoactive substance can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the unknown or unspecified substance.

Coding Note: Code also the causing condition

6C4G.40 Withdrawal due to unknown or unspecified psychoactive substance, uncomplicated

All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.

Coding Note: Code also the causing condition

6C4G.41 Withdrawal due to unknown or unspecified psychoactive substance, with perceptual disturbances

All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.

Coding Note: Code also the causing condition

6C4G.42 Withdrawal due to unknown or unspecified psychoactive substance, with seizures

All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.

Coding Note: Code also the causing condition

6C4G.43 Withdrawal due to unknown or unspecified psychoactive, with perceptual disturbances and seizures

The development of a withdrawal syndrome accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the unknown or unspecified substance.

Coding Note: Code also the causing condition

6C4G.4Z Withdrawal due to unknown or unspecified psychoactive substance, unspecified

Coding Note: Code also the causing condition

6C4G.5 Delirium induced by unknown or unspecified psychoactive substance

Delirium induced by unknown or unspecified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of an unknown or unspecified substance. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from another substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

Coding Note: Code also the causing condition

6C4G.6 **Psychotic disorder induced by unknown or unspecified psychoactive substance**

Psychotic disorder induced by unknown or unspecified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).

Coding Note: Code also the causing condition

6C4G.7 **Certain unknown or unspecified psychoactive substance-induced mental or behavioural disorders**

Coding Note: Code also the causing condition

6C4G.70 Mood disorder induced by unknown or unspecified psychoactive substance

Mood disorder induced by unknown or unspecified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).

Coding Note: Code also the causing condition

6C4G.71 Anxiety disorder induced by unknown or unspecified psychoactive substance

Anxiety disorder induced by unknown or unspecified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).

Coding Note: Code also the causing condition

6C4G.72 Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance

Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).

Coding Note: Code also the causing condition

6C4G.73 Impulse control disorder induced by unknown or unspecified psychoactive substance

Impulse control disorder induced by unknown or unspecified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).

Coding Note: Code also the causing condition

6C4G.Y **Other specified disorders due to use of unknown or unspecified psychoactive substances**

6C4G.Z **Disorders due to use of unknown or unspecified psychoactive substances, unspecified**

6C4H Disorders due to use of non-psychoactive substances

Disorders due to use of non-psychoactive substances are characterised by the pattern and consequences of non-medical use of non-psychoactive substances. Non-psychoactive substances include laxatives, growth hormone, erythropoietin, and non-steroidal anti-inflammatory drugs. They may also include proprietary or over-the-counter medicines and folk remedies. Non-medical use of these substances may be associated with harm to the individual due to the direct or secondary toxic effects of the non-psychoactive substance on body organs and systems, or a harmful route of administration (e.g., infections due to intravenous self-administration). They are not associated with intoxication or with a dependence or withdrawal syndrome and are not recognized causes of substance-induced mental disorders.

6C4H.0 **Episode of harmful use of non-psychoactive substances**

An episode of use of a non-psychoactive substance that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to direct or secondary toxic effects on body organs and systems or a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of non-psychoactive substance use.

Exclusions: Harmful pattern of use of non-psychoactive substances (6C4H.1)

6C4H.1 **Harmful pattern of use of non-psychoactive substances**

A pattern of use of non-psychoactive substances that has caused clinically significant harm to a person's physical or mental health. The pattern of use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the direct or secondary toxic effects of the substance on body organs and systems, or a harmful route of administration.

Exclusions: Harmful pattern of use of other specified psychoactive substance (6C4E.1)

Episode of harmful use of non-psychoactive substances (6C4H.0)

6C4H.10 Harmful pattern of use of non-psychoactive substances, episodic

A pattern of episodic or intermittent use of a non-psychoactive substance that has caused damage to a person's physical or mental health. The pattern of episodic or intermittent use of the non-psychoactive substance is evident over a period of at least 12 months. Harm may be caused by the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

6C4H.11 Harmful pattern of use of non-psychoactive substances, continuous

A pattern of continuous use of a non-psychoactive substance (daily or almost daily) that has caused damage to a person's physical or mental health. The pattern of continuous use of the non-psychoactive substance is evident over a period of at least one month. Harm may be caused by the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

6C4H.1Z Harmful pattern of use of non-psychoactive substances, unspecified

6C4H.Y **Other specified disorders due to use of non-psychoactive substances**

6C4H.Z **Disorders due to use of non-psychoactive substances, unspecified**

6C4Y **Other specified disorders due to substance use**

6C4Z **Disorders due to substance use, unspecified**

Disorders due to addictive behaviours (6C50-6C5Z)

Disorders due to addictive behaviours are recognizable and clinically significant syndromes associated with distress or interference with personal functions that develop as a result of repetitive rewarding behaviours other than the use of dependence-producing substances. Disorders due to addictive behaviours include gambling disorder and gaming disorder, which may involve both online and offline behaviour.

Exclusions: Compulsive sexual behaviour disorder (6C72)

Paraphilic disorders (6D30-6D3Z)

6C50 Gambling disorder

Gambling disorder is characterised by a pattern of persistent or recurrent gambling behaviour, which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);

2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and

3. continuation or escalation of gambling despite the occurrence of negative consequences.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The pattern of gambling behaviour results in significant distress or in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

Inclusions: Compulsive gambling

Exclusions: Bipolar type I disorder (6A60)

Bipolar type II disorder (6A61)

Hazardous gambling or betting (QE21)

6C50.0 Gambling disorder, predominantly offline

Gambling disorder, predominantly offline is characterised by a pattern of persistent or recurrent gambling behaviour that is not primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

Exclusions: Hazardous gambling or betting (QE21)

6C50.1 Gambling disorder, predominantly online

Gambling disorder, predominantly online is characterised by a pattern of persistent or recurrent gambling behaviour that is primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

Exclusions: Hazardous gambling or betting (QE21)

6C50.Z Gambling disorder, unspecified

6C51 Gaming disorder

Gaming disorder is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming'), which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);

2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and

3. continuation or escalation of gaming despite the occurrence of negative consequences.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The pattern of gaming behaviour results in marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

Exclusions: Hazardous gaming (QE22)

Bipolar type I disorder (6A60)

Bipolar type II disorder (6A61)

6C51.0 Gaming disorder, predominantly online

Gaming disorder, predominantly online is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and

3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

6C51.1 Gaming disorder, predominantly offline

Gaming disorder, predominantly offline is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is not primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and
3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

6C51.Z Gaming disorder, unspecified

6C5Y Other specified disorders due to addictive behaviours

6C5Z Disorders due to addictive behaviours, unspecified

Impulse control disorders (6C70-6C7Z)

Impulse control disorders are characterised by the repeated failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite consequences such as longer-term harm either to the individual or to others, marked distress about the behaviour pattern, or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Impulse Control Disorders involve a range of specific behaviours, including fire-setting, stealing, sexual behaviour, and explosive outbursts.

Coded Elsewhere: Substance-induced impulse control disorders

Gambling disorder (6C50)

Gaming disorder (6C51)

Secondary impulse control syndrome (6E66)

Body-focused repetitive behaviour disorders (6B25)

6C70 Pyromania

Pyromania is characterised by a recurrent failure to control strong impulses to set fires, resulting in multiple acts of, or attempts at, setting fire to property or other objects, in the absence of an apparent motive (e.g., monetary gain, revenge, sabotage, political statement, attracting attention or recognition). There is an increasing sense of tension or affective arousal prior to instances of fire setting, persistent fascination or preoccupation with fire and related stimuli (e.g., watching fires, building fires, fascination with firefighting equipment), and a sense of pleasure, excitement, relief or gratification during, and immediately after the act of setting the fire, witnessing its effects, or participating in its aftermath. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

Inclusions: pathological fire-setting

Exclusions: Conduct-dissocial disorder (6C91)

Bipolar type I disorder (6A60)

Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Fire-setting as the reason for observation for suspected mental or behavioural disorders, ruled out (QA02.3)

6C71 Kleptomania

Kleptomania is characterised by a recurrent failure to control strong impulses to steal objects in the absence of an apparent motive (e.g., objects are not acquired for personal use or monetary gain). There is an increasing sense of tension or affective arousal before instances of theft and a sense of pleasure, excitement, relief, or gratification during and immediately after the act of stealing. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

Coding Note: If stealing occurs within the context of conduct-dissocial disorder or a manic episode, Kleptomania should not be diagnosed separately.

Inclusions: pathological stealing

Exclusions: shoplifting as the reason for observation for suspected mental disorder, ruled out (QA02.3)

6C72 Compulsive sexual behaviour disorder

Compulsive sexual behaviour disorder is characterised by a persistent pattern of failure to control intense, repetitive sexual impulses or urges resulting in repetitive sexual behaviour. Symptoms may include repetitive sexual activities becoming a central focus of the person's life to the point of neglecting health and personal care or other interests, activities and responsibilities; numerous unsuccessful efforts to significantly reduce repetitive sexual behaviour; and continued repetitive sexual behaviour despite adverse consequences or deriving little or no satisfaction from it. The pattern of failure to control intense, sexual impulses or urges and resulting repetitive sexual behaviour is manifested over an extended period of time (e.g., 6 months or more), and causes marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Distress that is entirely related to moral judgments and disapproval about sexual impulses, urges, or behaviours is not sufficient to meet this requirement.

Exclusions: Paraphilic disorders (6D30-6D3Z)

6C73 Intermittent explosive disorder

Intermittent explosive disorder is characterised by repeated brief episodes of verbal or physical aggression or destruction of property that represent a failure to control aggressive impulses, with the intensity of the outburst or degree of aggressiveness being grossly out of proportion to the provocation or precipitating psychosocial stressors. The symptoms are not better explained by another mental, behavioural, or neurodevelopmental disorder and are not part of a pattern of chronic anger and irritability (e.g., in oppositional defiant disorder). The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

Exclusions: Oppositional defiant disorder (6C90)

6C7Y Other specified impulse control disorders

6C7Z Impulse control disorders, unspecified

Disruptive behaviour or dissocial disorders (6C90-6C9Z)

Disruptive behaviour and dissocial disorders are characterised by persistent behaviour problems that range from markedly and persistently defiant, disobedient, provocative or spiteful (i.e., disruptive) behaviours to those that persistently violate the basic rights of others or major age-appropriate societal norms, rules, or laws (i.e., dissocial). Onset of Disruptive and dissocial disorders is commonly, though not always, during childhood.

6C90 Oppositional defiant disorder

Oppositional defiant disorder is a persistent pattern (e.g., 6 months or more) of markedly defiant, disobedient, provocative or spiteful behaviour that occurs more frequently than is typically observed in individuals of comparable age and developmental level and that is not restricted to interaction with siblings. Oppositional defiant disorder may be manifest in prevailing, persistent angry or irritable mood, often accompanied by severe temper outbursts or in headstrong, argumentative and defiant behaviour. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning

6C90.0 Oppositional defiant disorder with chronic irritability-anger

All definitional requirements for oppositional defiant disorder are met. This form of oppositional defiant disorder is characterised by prevailing, persistent angry or irritable mood that may be present independent of any apparent provocation. The negative mood is often accompanied by regularly occurring severe temper outbursts that are grossly out of proportion in intensity or duration to the provocation. Chronic irritability and anger are characteristic of the individual's functioning nearly every day, are observable across multiple settings or domains of functioning (e.g., home, school, social relationships), and are not restricted to the individual's relationship with his/her parents or guardians. The pattern of chronic irritability and anger is not limited to occasional episodes (e.g., developmentally typical irritability) or discrete periods (e.g., irritable mood in the context of manic or depressive episodes).

6C90.00 Oppositional defiant disorder with chronic irritability-anger with limited prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.

6C90.01 Oppositional defiant disorder with chronic irritability-anger with typical prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

6C90.0Z Oppositional defiant disorder with chronic irritability-anger, unspecified

6C90.1 **Oppositional defiant disorder without chronic irritability-anger**

Meets all definitional requirements for oppositional defiant disorder. This form of oppositional defiant disorder is not characterised by prevailing, persistent, angry or irritable mood, but does feature headstrong, argumentative, and defiant behaviour.

6C90.10 Oppositional defiant disorder without chronic irritability-anger with limited prosocial emotions

All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental. This pattern is pervasive across situations and relationships (i.e., the qualifier should not be applied based on a single characteristic, a single relationship, or a single instance of behaviour) and is pattern is persistent over time (e.g., at least 1 year).

6C90.11 Oppositional defiant disorder without chronic irritability-anger with typical prosocial emotions

All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

6C90.1Z Oppositional defiant disorder without chronic irritability-anger, unspecified

6C90.Z **Oppositional defiant disorder, unspecified**

6C91 Conduct-dissocial disorder

Conduct-dissocial disorder is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. To be diagnosed, the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.

6C91.0 **Conduct-dissocial disorder, childhood onset**

Conduct-dissocial disorder, childhood onset is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. To be diagnosed, features of the disorder must be present during childhood prior to adolescence (e.g., before 10 years of age) and the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.

6C91.00 Conduct-dissocial disorder, childhood onset with limited prosocial emotions

Meets all definitional requirements for Conduct-dissocial disorder, childhood onset. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.

6C91.01 Conduct-dissocial disorder, childhood onset with typical prosocial emotions

All definitional requirements for conduct-dissocial disorder, childhood onset are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

6C91.0Z Conduct-dissocial disorder, childhood onset, unspecified

6C91.1 Conduct-dissocial disorder, adolescent onset

Conduct-dissocial disorder, adolescent onset is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. No features of the disorder are present during childhood prior to adolescence (e.g., before 10 years of age). To be diagnosed, the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.

6C91.10 Conduct-dissocial disorder, adolescent onset with limited prosocial emotions

All definitional requirements for conduct-dissocial disorder, adolescent onset are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.

6C91.11 Conduct-dissocial disorder, adolescent onset with typical prosocial emotions

All definitional requirements for conduct-dissocial disorder, adolescent onset are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

6C91.1Y Other specified conduct-dissocial disorder, adolescent onset

6C91.Z Conduct-dissocial disorder, unspecified

6C9Y Other specified disruptive behaviour or dissocial disorders

6C9Z **Disruptive behaviour or dissocial disorders, unspecified**

Personality disorders and related traits (6D10-6D11.5)

Coded Elsewhere: Secondary personality change (6E68)

6D10 **Personality disorder**

Personality disorder is characterised by problems in functioning of aspects of the self (e.g., identity, self-worth, accuracy of self-view, self-direction), and/or interpersonal dysfunction (e.g., ability to develop and maintain close and mutually satisfying relationships, ability to understand others' perspectives and to manage conflict in relationships) that have persisted over an extended period of time (e.g., 2 years or more). The disturbance is manifest in patterns of cognition, emotional experience, emotional expression, and behaviour that are maladaptive (e.g., inflexible or poorly regulated) and is manifest across a range of personal and social situations (i.e., is not limited to specific relationships or social roles). The patterns of behaviour characterizing the disturbance are not developmentally appropriate and cannot be explained primarily by social or cultural factors, including socio-political conflict. The disturbance is associated with substantial distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6D10.0 Mild personality disorder

All general diagnostic requirements for Personality Disorder are met. Disturbances affect some areas of personality functioning but not others (e.g., problems with self-direction in the absence of problems with stability and coherence of identity or self-worth), and may not be apparent in some contexts. There are problems in many interpersonal relationships and/or in performance of expected occupational and social roles, but some relationships are maintained and/or some roles carried out. Specific manifestations of personality disturbances are generally of mild severity. Mild Personality Disorder is typically not associated with substantial harm to self or others, but may be associated with substantial distress or with impairment in personal, family, social, educational, occupational or other important areas of functioning that is either limited to circumscribed areas (e.g., romantic relationships; employment) or present in more areas but milder.

6D10.1 **Moderate personality disorder**

All general diagnostic requirements for Personality Disorder are met. Disturbances affect multiple areas of personality functioning (e.g., identity or sense of self, ability to form intimate relationships, ability to control impulses and modulate behaviour). However, some areas of personality functioning may be relatively less affected. There are marked problems in most interpersonal relationships and the performance of most expected social and occupational roles are compromised to some degree. Relationships are likely to be characterised by conflict, avoidance, withdrawal, or extreme dependency (e.g., few friendships maintained, persistent conflict in work relationships and consequent occupational problems, romantic relationships characterised by serious disruption or inappropriate submissiveness). Specific manifestations of personality disturbance are generally of moderate severity. Moderate Personality Disorder is sometimes associated with harm to self or others, and is associated with marked impairment in personal, family, social, educational, occupational or other important areas of functioning, although functioning in circumscribed areas may be maintained.

6D10.2 **Severe personality disorder**

All general diagnostic requirements for Personality Disorder are met. There are severe disturbances in functioning of the self (e.g., sense of self may be so unstable that individuals report not having a sense of who they are or so rigid that they refuse to participate in any but an extremely narrow range of situations; self view may be characterised by self-contempt or be grandiose or highly eccentric). Problems in interpersonal functioning seriously affect virtually all relationships and the ability and willingness to perform expected social and occupational roles is absent or severely compromised. Specific manifestations of personality disturbance are severe and affect most, if not all, areas of personality functioning. Severe Personality Disorder is often associated with harm to self or others, and is associated with severe impairment in all or nearly all areas of life, including personal, family, social, educational, occupational, and other important areas of functioning.

6D10.Z **Personality disorder, severity unspecified**

6D11 Prominent personality traits or patterns

Trait domain qualifiers may be applied to Personality Disorders or Personality Difficulty to describe the characteristics of the individual's personality that are most prominent and that contribute to personality disturbance. Trait domains are continuous with normal personality characteristics in individuals who do not have Personality Disorder or Personality Difficulty. Trait domains are not diagnostic categories, but rather represent a set of dimensions that correspond to the underlying structure of personality. As many trait domain qualifiers may be applied as necessary to describe personality functioning. Individuals with more severe personality disturbance tend to have a greater number of prominent trait domains.

6D11.0 **Negative affectivity in personality disorder or personality difficulty**

The core feature of the Negative Affectivity trait domain is the tendency to experience a broad range of negative emotions. Common manifestations of Negative Affectivity, not all of which may be present in a given individual at a given time, include: experiencing a broad range of negative emotions with a frequency and intensity out of proportion to the situation; emotional lability and poor emotion regulation; negativistic attitudes; low self-esteem and self-confidence; and mistrustfulness.

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

6D11.1 **Detachment in personality disorder or personality difficulty**

The core feature of the Detachment trait domain is the tendency to maintain interpersonal distance (social detachment) and emotional distance (emotional detachment). Common manifestations of Detachment, not all of which may be present in a given individual at a given time, include: social detachment (avoidance of social interactions, lack of friendships, and avoidance of intimacy); and emotional detachment (reserve, aloofness, and limited emotional expression and experience).

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

6D11.2 **Dissociality in personality disorder or personality difficulty**

The core feature of the Dissociality trait domain is disregard for the rights and feelings of others, encompassing both self-centeredness and lack of empathy. Common manifestations of Dissociality, not all of which may be present in a given individual at a given time, include: self-centeredness (e.g., sense of entitlement, expectation of others' admiration, positive or negative attention-seeking behaviours, concern with one's own needs, desires and comfort and not those of others); and lack of empathy (i.e., indifference to whether one's actions inconvenience hurt others, which may include being deceptive, manipulative, and exploitative of others, being mean and physically aggressive, callousness in response to others' suffering, and ruthlessness in obtaining one's goals).

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

6D11.3 **Disinhibition in personality disorder or personality difficulty**

The core feature of the Disinhibition trait domain is the tendency to act rashly based on immediate external or internal stimuli (i.e., sensations, emotions, thoughts), without consideration of potential negative consequences. Common manifestations of Disinhibition, not all of which may be present in a given individual at a given time, include: impulsivity; distractibility; irresponsibility; recklessness; and lack of planning.

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

6D11.4 **Anankastia in personality disorder or personality difficulty**

The core feature of the Anankastia trait domain is a narrow focus on one's rigid standard of perfection and of right and wrong, and on controlling one's own and others' behaviour and controlling situations to ensure conformity to these standards. Common manifestations of Anankastia, not all of which may be present in a given individual at a given time, include: perfectionism (e.g., concern with social rules, obligations, and norms of right and wrong, scrupulous attention to detail, rigid, systematic, day-to-day routines, hyper-scheduling and planfulness, emphasis on organisation, orderliness, and neatness); and emotional and behavioural constraint (e.g., rigid control over emotional expression, stubbornness and inflexibility, risk-avoidance, perseveration, and deliberativeness).

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

6D11.5 **Borderline pattern**

The Borderline pattern specifier may be applied to individuals whose pattern of personality disturbance is characterised by a pervasive pattern of instability of interpersonal relationships, self-image, and affects, and marked impulsivity, as indicated by many of the following: Frantic efforts to avoid real or imagined abandonment; A pattern of unstable and intense interpersonal relationships; Identity disturbance, manifested in markedly and persistently unstable self-image or sense of self; A tendency to act rashly in states of high negative affect, leading to potentially self-damaging behaviours; Recurrent episodes of self-harm; Emotional instability due to marked reactivity of mood; Chronic feelings of emptiness; Inappropriate intense anger or difficulty controlling anger; Transient dissociative symptoms or psychotic-like features in situations of high affective arousal.

Coding Note: This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

Paraphilic disorders (6D30-6D3Z)

Paraphilic disorders are characterised by persistent and intense patterns of atypical sexual arousal, manifested by sexual thoughts, fantasies, urges, or behaviours, the focus of which involves others whose age or status renders them unwilling or unable to consent and on which the person has acted or by which he or she is markedly distressed. Paraphilic disorders may include arousal patterns involving solitary behaviours or consenting individuals only when these are associated with marked distress that is not simply a result of rejection or feared rejection of the arousal pattern by others or with significant risk of injury or death.

Inclusions: paraphilias

6D30 **Exhibitionistic disorder**

Exhibitionistic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves exposing one's genitals to an unsuspecting individual in public places, usually without inviting or intending closer contact. In addition, in order for Exhibitionistic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Exhibitionistic Disorder specifically excludes consensual exhibitionistic behaviours that occur with the consent of the person or persons involved as well as socially sanctioned forms of exhibitionism.

6D31 **Voyeuristic disorder**

Voyeuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves observing an unsuspecting individual who is naked, in the process of disrobing, or engaging in sexual activity. In addition, in order for Voyeuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Voyeuristic Disorder specifically excludes consensual voyeuristic behaviours that occur with the consent of the person or persons being observed.

6D32 **Pedophilic disorder**

Pedophilic disorder is characterised by a sustained, focused, and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—involving pre-pubertal children. In addition, in order for Pedophilic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. This diagnosis does not apply to sexual behaviours among pre- or post-pubertal children with peers who are close in age.

6D33 **Coercive sexual sadism disorder**

Coercive sexual sadism disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges or behaviours—that involves the infliction of physical or psychological suffering on a non-consenting person. In addition, in order for Coercive Sexual Sadism Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Coercive Sexual Sadism Disorder specifically excludes consensual sexual sadism and masochism.

6D34 **Frotteuristic disorder**

Frotteuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal— as manifested by persistent sexual thoughts, fantasies, urges, or behaviours— that involves touching or rubbing against a non-consenting person in crowded public places. In addition, in order for Frotteuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Frotteuristic Disorder specifically excludes consensual touching or rubbing that occur with the consent of the person or persons involved.

6D35 **Other paraphilic disorder involving non-consenting individuals**

Other paraphilic disorder involving non-consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal— manifested by sexual thoughts, fantasies, urges, or behaviours— in which the focus of the arousal pattern involves others who are unwilling or unable to consent but that is not specifically described in any of the other named Paraphilic Disorders categories (e.g., arousal patterns involving corpses or animals). The individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. The disorder specifically excludes sexual behaviours that occur with the consent of the person or persons involved, provided that they are considered able to provide such consent.

6D36 **Paraphilic disorder involving solitary behaviour or consenting individuals**

Paraphilic disorder involving solitary behaviour or consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal—manifested by sexual thoughts, fantasies, urges, or behaviours— that involves consenting adults or solitary behaviours. One of the following two elements must be present: 1) the person is markedly distressed by the nature of the arousal pattern and the distress is not simply a consequence of rejection or feared rejection of the arousal pattern by others; or 2) the nature of the paraphilic behaviour involves significant risk of injury or death either to the individual or to the partner (e.g., asphyxophilia).

6D3Z **Paraphilic disorders, unspecified**

Factitious disorders (6D50-6D5Z)

Factitious disorders are characterised by intentionally feigning, falsifying, inducing, or aggravating medical, psychological, or behavioural signs and symptoms or injury in oneself or in another person, most commonly a child dependent, associated with identified deception. A pre-existing disorder or disease may be present, but the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. Individuals with factitious disorder seek treatment or otherwise present themselves or another person as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour.

Exclusions: Malingering (QC30)

6D50 **Factitious disorder imposed on self**

Factitious disorder imposed on self is characterised by feigning, falsifying, or inducing medical, psychological, or behavioural signs and symptoms or injury associated with identified deception. If a pre-existing disorder or disease is present, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment or otherwise presents himself or herself as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour

Inclusions: Münchhausen syndrome

Exclusions: Excoriation disorder (6B25.1)

Malingering (QC30)

6D51 **Factitious disorder imposed on another**

Factitious disorder imposed on another is characterised by feigning, falsifying, or inducing, medical, psychological, or behavioural signs and symptoms or injury in another person, most commonly a child dependent, associated with identified deception. If a pre-existing disorder or disease is present in the other person, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment for the other person or otherwise presents him or her as ill, injured, or impaired based on the feigned, falsified, or induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or avoiding criminal prosecution for child or elder abuse).

Coding Note: The diagnosis of Factitious Disorder Imposed on Another is assigned to the individual who is feigning, falsifying or inducing the symptoms in another person, not to the person who is presented as having the symptoms. Occasionally the individual induces or falsifies symptoms in a pet rather than in another person.

Exclusions: Malingering (QC30)

6D5Z **Factitious disorders, unspecified**

Neurocognitive disorders (6D70-6E0Z)

Neurocognitive disorders are characterised by primary clinical deficits in cognitive functioning that are acquired rather than developmental. That is, neurocognitive disorders do not include disorders characterised by deficits in cognitive function that are present from birth or that typically arise during the developmental period, which are classified in the grouping neurodevelopmental disorders. Rather, neurocognitive disorders represent a decline from a previously attained level of functioning. Although cognitive deficits are present in many mental disorders (e.g., schizophrenia, bipolar disorders), only disorders whose core features are cognitive are included in the neurocognitive Disorders grouping. In cases where the underlying pathology and etiology for neurocognitive disorders can be determined, the identified etiology should be classified separately.

Exclusions: Neurodevelopmental disorders (6A00-6A0Z)

Coded Elsewhere: Secondary neurocognitive syndrome (6E67)

6D70 **Delirium**

Delirium is characterized by a disturbance of attention, orientation, and awareness that develops within a short period of time, typically presenting as significant confusion or global neurocognitive impairment, with transient symptoms that may fluctuate depending on the underlying causal condition or etiology. Delirium often includes disturbance of behaviour and emotion, and may include impairment in multiple cognitive domains. A disturbance of the sleep-wake cycle, including reduced arousal of acute onset or total sleep loss with reversal of the sleep-wake cycle, may also be present. Delirium may be caused by the direct physiological effects of a medical condition not classified under mental, behavioural or neurodevelopmental disorders, by the direct physiological effects of a substance or medication, including withdrawal, or by multiple or unknown etiological factors.

6D70.0 Delirium due to disease classified elsewhere

All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that Delirium is caused by the direct physiological consequences of a disorder or disease classified elsewhere.

Coding Note: Identified etiology should be classified separately.

6D70.1 Delirium due to psychoactive substances including medications

All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that the delirium is caused by the direct physiological effects of a substance or medication (including withdrawal). If the specific substance inducing the delirium has been identified, it should be classified using the appropriate subcategory (e.g., alcohol-induced delirium).

Coded Elsewhere: Alcohol-induced delirium (6C40.5)

Cannabis-induced delirium (6C41.5)

Synthetic cannabinoid-induced delirium (6C42.5)

Opioid-induced delirium (6C43.5)

Sedative, hypnotic or anxiolytic-induced delirium (6C44.5)

Cocaine-induced delirium (6C45.5)

Stimulant-induced delirium including amphetamines, methamphetamine or methcathinone (6C46.5)

Synthetic cathinone-induced delirium (6C47.5)

Hallucinogen-induced delirium (6C49.4)

Volatile inhalant-induced delirium (6C4B.5)

MDMA or related drug-induced delirium, including MDA (6C4C.5)

Dissociative drug-induced delirium including ketamine or PCP (6C4D.4)

Delirium induced by other specified psychoactive substance including medications (6C4E.5)

Delirium induced by multiple specified psychoactive substances including medications (6C4F.5)

Delirium induced by unknown or unspecified psychoactive substance (6C4G.5)

6D70.2 Delirium due to multiple etiological factors

All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that the delirium is attributable to multiple etiological factors, which may include disorders or diseases not classified under mental and behavioural disorders, substance intoxication or withdrawal, or a medication.

Coding Note: Identified etiologies should be classified separately.

6D70.Y Delirium, other specified cause

6D70.Z Delirium, unspecified or unknown cause

6D71 Mild neurocognitive disorder

Mild neurocognitive disorder is characterized by mild impairment in one or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Diagnosis is based on report from the patient, informant, or clinical observation, and is accompanied by objective evidence of impairment by quantified clinical assessment or standardized cognitive testing. Cognitive impairment is not severe enough to significantly interfere with an individual's ability to perform activities related to personal, family, social, educational, and/or occupational functioning or other important functional areas. Cognitive impairment is not attributable to normal aging and may be static, progressive, or may resolve or improve depending on underlying cause or treatment. Cognitive impairment may be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

Coding Note: Code also the causing condition

6D72 Amnestic disorder

Amnestic disorder is characterized by prominent memory impairment relative to expectations for age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning, in the absence of other significant cognitive impairment. It is manifested by a deficit in acquiring, learning, and/or retaining new information, and may include the inability to recall previously learned information, without disturbance of consciousness, altered mental status, or delirium. Recent memory is typically more disturbed than remote memory, and the ability to immediately recall a limited amount of information is usually relatively preserved. The memory impairment is severe enough to result in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. It is is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

Exclusions: Delirium (6D70)

Dementia (6D80-6D8Z)

Mild neurocognitive disorder (6D71)

6D72.0 **Amnestic disorder due to diseases classified elsewhere**

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct pathophysiological consequence of a medical condition not classified under mental, behavioural and neurodevelopmental disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not better explained by Delirium, Dementia, another mental disorder (e.g., Schizophrenia or Other Primary Psychotic Disorder, a Mood Disorder) or the effects of a medication or substance, including withdrawal effects. The symptoms are sufficiently severe to be a specific focus of clinical attention. The identified etiological medical condition should be classified separately.

Coding Note: Code also the causing condition

Exclusions: amnesia: retrograde (MB21.11)

Korsakoff syndrome, alcohol-induced or unspecified (8D44)

Dissociative amnesia (6B61)

Anterograde amnesia (MB21.10)

amnesia NOS (MB21.1)

6D72.1 **Amnestic disorder due to psychoactive substances including medications**

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of psychoactive substance use. The intensity and duration of substance use must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after substance intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of substance use.

Coding Note: Code also the causing condition

6D72.10 Amnestic disorder due to use of alcohol

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of alcohol use. The intensity and duration of alcohol use must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after alcohol intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of the alcohol use.

Coding Note: This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.

Exclusions: Korsakoff syndrome (5B5A.11)

Wernicke-Korsakoff Syndrome (5B5A.1)

6D72.11 Amnestic disorder due to use of sedatives, hypnotics or anxiolytics

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of sedatives, hypnotics or anxiolytics. The intensity and duration of use of sedatives, hypnotics or anxiolytics must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after sedative, hypnotic or anxiolytic intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of use of sedatives, hypnotics or anxiolytics.

Coding Note: Code also the causing condition

6D72.12 Amnestic disorder due to other specified psychoactive substance including medications

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of a specified psychoactive substance other than alcohol; sedatives, hypnotics or anxiolytics; or volatile inhalants. The intensity and duration of use of the specified psychoactive substance must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after specified psychoactive substance intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of the specified psychoactive substance.

6D72.13 Amnestic disorder due to use of volatile inhalants

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of volatile inhalants. The intensity and duration of use of volatile inhalants must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after volatile inhalant intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of use of volatile inhalants.

6D72.Y **Amnestic disorder, other specified cause**

6D72.Z **Amnestic disorder, unknown or unspecified cause**

Dementia is characterized by the presence of marked impairment in two or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Memory impairment is present in most forms of dementia, but cognitive impairment is not restricted to memory (i.e., there is impairment in other areas such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities). Neurobehavioural changes may also be present and, in some forms of dementia, may be the presenting symptom. Cognitive impairment is not attributable to normal aging and is severe enough to significantly interfere with independence in an individual's performance of activities of daily living. The cognitive impairment is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, or to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

Coding Note: This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

Inclusions: Dementia NOS

Exclusions: Coma (MB20.1)

Delirium (6D70)

Disorders of intellectual development (6A00)

Neurodevelopmental disorders (6A00-6A0Z)

Stupor (MB20.0)

Ageing associated decline in intrinsic capacity (MG2A)

6D80 Dementia due to Alzheimer disease

Dementia due to Alzheimer disease is the most common form of dementia. Onset is insidious with memory impairment typically reported as the initial presenting complaint. The characteristic course is a slow but steady decline from a previous level of cognitive functioning with impairment in additional cognitive domains (such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities) emerging with disease progression. Dementia due to Alzheimer disease may be accompanied by mental and behavioural symptoms such as depressed mood and apathy in the initial stages of the disease and may be accompanied by psychotic symptoms, irritability, aggression, confusion, abnormalities of gait and mobility, and seizures at later stages. Positive genetic testing, family history and gradual cognitive decline are suggestive of Dementia due to Alzheimer disease.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

6D80.0 Dementia due to Alzheimer disease with early onset

Dementia due to Alzheimer disease in which symptoms emerge before the age of 65 years. It is relatively rare, representing less than 5% of all cases, and may be genetically determined (autosomal dominant Alzheimer disease). Clinical presentation may be similar to cases with later onset, but progression of cognitive deficits may be more rapid.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D80.1 Dementia due to Alzheimer disease with late onset

Dementia due to Alzheimer disease that develops at the age of 65 years or above. This is the most common pattern, representing more than 95% of all cases.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D80.2 Alzheimer disease dementia, mixed type, with cerebrovascular disease

Dementia due to Alzheimer disease and concomitant cerebrovascular disease.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D80.3 Alzheimer disease dementia, mixed type, with other nonvascular aetiologies

Dementia due to Alzheimer disease with other concomitant pathology, not including cerebrovascular disease.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D80.Z Dementia due to Alzheimer disease, onset unknown or unspecified

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

6D81 Dementia due to cerebrovascular disease

Dementia due to brain parenchyma injury resulting from cerebrovascular disease (ischemic or haemorrhagic). The onset of the cognitive deficits is temporally related to one or more vascular events. Cognitive decline is typically most prominent in speed of information processing, complex attention, and frontal-executive functioning. There is evidence of the presence of cerebrovascular disease considered to be sufficient to account for the neurocognitive deficits from history, physical examination and neuroimaging.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

Exclusions: Alzheimer disease dementia, mixed type, with cerebrovascular disease (6D80.2)

6D82 Dementia due to Lewy body disease

Dementia preceding or occurring within one year after the onset of motor parkinsonian signs in the setting of Lewy body disease. Characterized by presence of Lewy bodies, which are intraneuronal inclusions containing α-synuclein and ubiquitin in the brain stem, limbic area, forebrain, and neocortex. Onset is insidious with attentional and executive functioning deficits often present. These cognitive deficits are often accompanied by visual hallucinations and symptoms of REM sleep behaviour disorder. Hallucinations in other sensory modalities, depressive symptoms, and delusions may also be present. The symptom presentation usually varies significantly over the course of days necessitating longitudinal assessment and differentiation from delirium. Spontaneous onset of Parkinsonism within approximately 1 year of the onset of cognitive symptoms is common.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D83 Frontotemporal dementia

Frontotemporal dementia (FTD) is a group of primary neurodegenerative disorders primarily affecting the frontal and temporal lobes. Onset is typically insidious with a gradual and worsening course. Several syndromic variants (some with an identified genetic basis or familiality) are described that include presentations with predominantly marked personality and behavioral changes (such as executive dysfunction, apathy, deterioration of social cognition, repetitive behaviours, and dietary changes),predominantly language deficits (that include semantic, agrammatic/nonfluent, and logopenic forms), predominantly movement-related deficits (progressive supranuclear palsy, corticobasal degeneration, multiple systems atrophy, or amyotrophic lateral sclerosis), or a combination of these deficits. Memory function, often remains relatively intact, particularly during the early stages of the disorder.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D84 Dementia due to psychoactive substances including medications

Dementia due to psychoactive substances including medications includes forms of dementia that are judged to be a direct consequence of substance use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of substance use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by substances such as a dementia due to another medical condition.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

Exclusions: Dementia due to exposure to heavy metals and other toxins (6D85.2)

6D84.0 Dementia due to use of alcohol

Dementia due to use of alcohol is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of alcohol use and that persist beyond the usual duration of alcohol intoxication or acute withdrawal. The intensity and duration of alcohol use must have been sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder or disease that is not induced by alcohol such as a dementia due to another disorder or disease classified elsewhere.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.

Inclusions: Alcohol-induced dementia

Exclusions: Wernicke-Korsakoff Syndrome (5B5A.1)

Korsakoff syndrome (5B5A.11)

6D84.1 **Dementia due to use of sedatives, hypnotics or anxiolytics**

Dementia due to use of sedatives, hypnotics or anxiolytics is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of sedative, hypnotic, or anxiolytic use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of sedative, hypnotic, or anxiolytic use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by sedatives, hypnotics, or anxiolytics such as a dementia due to another medical condition.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

Inclusions: Late-onset psychoactive substance-induced psychotic disorder

6D84.2 **Dementia due to use of volatile inhalants**

Dementia due to use of volatile inhalants is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of inhalant use or exposure and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of inhalant use or exposure must be sufficient to be capable of producing the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by volatile inhalants such as a dementia due to another medical condition.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D84.Y **Dementia due to other specified psychoactive substance**

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85 Dementia due to diseases classified elsewhere

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.0 Dementia due to Parkinson disease

Dementia due to Parkinson disease develops among individuals with idiopathic Parkinson disease and is characterized by impairment in attention, memory, executive and visuo-spatial functions. Mental and behavioral symptoms such as changes in affect, apathy and hallucinations may also be present. Onset is insidious and the course is one of gradual worsening of symptoms.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.1 Dementia due to Huntington disease

Dementia due to Huntington disease occurs as part of a widespread degeneration of the brain due to a trinucleotide repeat expansion in the HTT gene, which is transmitted through autosomal dominance. Onset of symptoms is insidious typically in the third and fourth decade of life with gradual and slow progression. Initial symptoms typically include impairments in executive functions with relative sparing of memory, prior to the onset of motor deficits (bradykinesia and chorea) characteristic of Huntington disease.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

Inclusions: Dementia in Huntington chorea

6D85.2 Dementia due to exposure to heavy metals and other toxins

Dementia due to exposure to heavy metals and other toxins caused by toxic exposure to specific heavy metals such as aluminium from dialysis water, lead, mercury or manganese. The characteristic cognitive impairments in Dementia due to exposure to heavy metals and other toxins depend on the specific heavy metal or toxin that the individual has been exposed to but can affect any cognitive domain. Onset of symptoms is related to exposure and progression can be rapid especially with acute exposure. In many cases, symptoms are reversible when exposure is identified and ceases. Investigations such as brain imaging or neurophysiological testing may be abnormal. Lead poisoning is associated with abnormalities on brain imaging including widespread calcification and increased signal on MRI T2-weighted images of periventricular white matter, basal ganglia hypothalamus and pons. Dementia due to aluminium toxicity may demonstrate characteristic paroxysmal high-voltage delta EEG changes. Examination may make evident other features such as peripheral neuropathy in the case of lead, arsenic, or mercury.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

Exclusions: Dementia due to psychoactive substances including medications (6D84)

6D85.3 Dementia due to human immunodeficiency virus

Dementia due to human immunodeficiency virus develops during the course of confirmed HIV disease, in the absence of a concurrent illness or condition other than HIV infection that could explain the clinical features. Although a variety of patterns of cognitive deficit are possible depending on where the HIV pathogenic processes have occurred, typically deficits follow a subcortical pattern with impairments in executive function, processing speed, attention, and learning new information. The course of Dementia due to human immunodeficiency virus varies including resolution of symptoms, gradual decline in functioning, improvement, or fluctuation in symptoms. Rapid decline in cognitive functioning is rare with the advent of antiretroviral medications.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.4 Dementia due to multiple sclerosis

Dementia due to multiple sclerosis is a neurodegenerative disease due to the cerebral effects of multiple sclerosis, a demyelinating disease. Onset of symptoms is insidious and not secondary to the functional impairment attributable to the primary disease (i.e., multiple sclerosis). Cognitive impairments vary according to the location of demyelination but typically include deficits in processing speed, memory, attention, and aspects of executive functioning.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.5 Dementia due to prion disease

Dementia due to prion disease is a primary neurodegenerative disease caused by a group of spongiform encephalopathies resulting from abnormal prion protein accumulation in the brain. These can be sporadic, genetic (caused by mutations in the prion-protein gene), or transmissible (acquired from an infected individual). Onset is insidious and there is a rapid progression of symptoms and impairment characterised by cognitive deficits, ataxia, and motor symptoms (myoclonus, chorea, or dystonia). Diagnosis is typically made on the basis of brain imaging studies, presence of characteristic proteins in spinal fluid, EEG, or genetic testing.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.6 **Dementia due to normal pressure hydrocephalus**

Dementia due to normal pressure hydrocephalus results from excess accumulation of cerebrospinal fluid in the brain as a result of idiopathic, non-obstructive causes but can also be secondary to haemorrhage, infection or inflammation. Progression is gradual but intervention (e.g., shunt) may result in improvement of symptoms, especially if administered earlier in the course of the condition. Typically, cognitive impairments include reduced processing speed and deficits in executive functioning and attention. These symptoms are also typically accompanied by gait abnormalities and urinary incontinence. Brain imaging to reveal ventricular volume and characterize brain displacement is often necessary to confirm the diagnosis.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.7 **Dementia due to injury to the head**

Dementia due to injury to the head is caused by damage inflicted on the tissues of the brain as the direct or indirect result of an external force. Trauma to the brain is known to have resulted in loss of consciousness, amnesia, disorientation and confusion, or neurological signs. The symptoms characteristic of Dementia due to injury to the head must arise immediately following the trauma or after the individual gains consciousness and must persist beyond the acute post-injury period. Cognitive deficits vary depending on the specific brain areas affected and the severity of the injury but can include impairments in attention, memory, executive functioning, personality, processing speed, social cognition, and language abilities.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.8 **Dementia due to pellagra**

Dementia due to pellagra is caused by persistent lack of vitamin B3 (niacin) or tryptophan either in the diet or due to poor absorption in the gastrointestinal tract due to disease (e.g., Crohn disease) or due to the effects of some medications (e.g., isoniazid). Core signs of pellagra include dermatological changes (sensitivity to sunlight, lesions, alopecia, and oedema) and diarrhoea. With prolonged nutritional deficiency cognitive symptoms that include aggressivity, motor disturbances (ataxia and restlessness), confusion, and weakness are observed. Treatment with nutritional supplementation (e.g., niacin) typically results in reversal of symptoms.

Coding Note: Code also the causing condition

6D85.9 Dementia due to Down syndrome

Dementia due to Down syndrome is a neurodegenerative disorder related to the impact of abnormal increased production and accumulation of amyloid precursor protein (APP) leading to formation of beta-amyloid plaques and tau tangles. APP gene expression is increased due to its location on chromosome 21, which is abnormally triplicated in Down syndrome. Cognitive deficits and neuropathological features are similar to those observed in Alzheimer disease. Onset is typically after the fourth decade of life with a gradual decline in functioning, and may impact 50% or more of individuals with Down syndrome.

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D85.Y Dementia due to other specified diseases classified elsewhere

Coding Note: This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

6D86 Behavioural or psychological disturbances in dementia

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant behavioural or psychological disturbances.

Coding Note: These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.

Code all that apply.

Exclusions: Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)

6D86.0 Psychotic symptoms in dementia

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant delusions or hallucinations.

Exclusions: Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Secondary psychotic syndrome (6E61)

6D86.1 Mood symptoms in dementia

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant mood symptoms such as depressed mood, elevated mood, or irritable mood.

Exclusions: Mood disorders (6A60-6A8Z)

Secondary mood syndrome (6E62)

6D86.2 **Anxiety symptoms in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant symptoms of anxiety or worry.

Exclusions: Anxiety or fear-related disorders (6B00-6B0Z)

Secondary anxiety syndrome (6E63)

6D86.3 **Apathy in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant indifference or lack of interest.

Exclusions: Mood disorders (6A60-6A8Z)

Secondary mood syndrome (6E62)

6D86.4 **Agitation or aggression in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes: 1) clinically significant excessive psychomotor activity accompanied by increased tension; or 2) hostile or violent behaviour.

6D86.5 **Disinhibition in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant lack of restraint manifested in disregard for social conventions, impulsivity, and poor risk assessment.

6D86.6 **Wandering in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant wandering that puts the person at risk of harm.

6D86.Y **Other specified behavioural or psychological disturbances in dementia**

Coding Note: These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.

Code all that apply.

6D86.Z **Behavioural or psychological disturbances in dementia, unspecified**

Coding Note: These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.

Code all that apply.

6D8Y Dementia, other specified cause

Coding Note: This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

6D8Z **Dementia, unknown or unspecified cause**

Coding Note: This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

6E0Y **Other specified neurocognitive disorders**

6E0Z **Neurocognitive disorders, unspecified**

Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)

Syndromes associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involve significant mental and behavioural features. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

Coded Elsewhere: Psychological disorder related to obstetric fistula (GC04.1Y)

6E20 **Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, most commonly depressive symptoms. The syndrome does not include delusions, hallucinations, or other psychotic symptoms. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned. This designation should not be used to describe mild and transient depressive symptoms that do not meet the diagnostic requirements for a depressive episode, which may occur soon after delivery (so-called postpartum blues).

Coding Note: Code also the causing condition

6E21 **Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, including delusions, hallucinations, or other psychotic symptoms. Mood symptoms (depressive and/or manic) are also typically present. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

Coding Note: Code also the causing condition

6E2Z **Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, unspecified**

6E40 **Psychological or behavioural factors affecting disorders or diseases classified elsewhere**

Psychological and behavioural factors affecting disorders or diseases classified elsewhere are those that may adversely affect the manifestation, treatment, or course of a condition classified in another chapter of the ICD. These factors may adversely affect the manifestation, treatment, or course of the disorder or disease classified in another chapter by: interfering with the treatment of the disorder or disease by affecting treatment adherence or care seeking; constituting an additional health risk; or influencing the underlying pathophysiology to precipitate or exacerbate symptoms or otherwise necessitate medical attention. This diagnosis should be assigned only when the factors increase the risk of suffering, disability, or death and represent a focus of clinical attention, and should be assigned together with the diagnosis for the relevant other condition.

Inclusions: Psychological factors affecting physical conditions

Exclusions: Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)

6E40.0 Mental disorder affecting disorders or diseases classified elsewhere

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual is diagnosed with a mental, behavioural, or neurodevelopmental disorder that adversely affects the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., a woman with Bulimia Nervosa and Type 1 diabetes mellitus who skips insulin doses as a way to avoid weight gain that would otherwise be caused by her binge eating).

6E40.1 Psychological symptoms affecting disorders or diseases classified elsewhere

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits psychological symptoms that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., depressive symptoms interfering with rehabilitation following surgery).

6E40.2 Personality traits or coping style affecting disorders or diseases classified elsewhere

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits personality traits or coping styles that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., pathological denial of the need for surgery in a patient with cancer; hostile, pressured behaviour contributing to heart disease).

6E40.3 Maladaptive health behaviours affecting disorders or diseases classified elsewhere

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits maladaptive health behaviours that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., overeating, lack of exercise).

6E40.4 Stress-related physiological response affecting disorders or diseases classified elsewhere

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits stress-related physiological responses that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., stress-related exacerbation of ulcer, hypertension, arrhythmia, or tension headache).

6E40.Y Other specified psychological or behavioural factors affecting disorders or diseases classified elsewhere

6E40.Z Psychological or behavioural factors affecting disorders or diseases classified elsewhere, unspecified

Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)

This grouping includes syndromes characterised by the presence of prominent psychological or behavioural symptoms judged to be direct pathophysiological consequences of a medical condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., adjustment disorder or anxiety symptoms in response to being diagnosed with a life-threatening illness). These categories should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychological and behavioural symptoms are sufficiently severe to warrant specific clinical attention.

Exclusions: Acute pain (MG31)

Bodily distress disorder (6C20)

Chronic pain (MG30)

Coded Elsewhere: Delirium due to disease classified elsewhere (6D70.0)

6E60 **Secondary neurodevelopmental syndrome**

A syndrome that involves significant neurodevelopmental features that do not fulfill the diagnostic requirements of any of the specific neurodevelopmental disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders (e.g., autistic-like features in Retts syndrome; aggression and self-mutilation in Lesch-Nyhan syndrome, abnormalities in language development in Williams syndrome), based on evidence from the history, physical examination, or laboratory findings.

This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Autism spectrum disorder (6A02)

Disorders of intellectual development (6A00)

Stereotyped movement disorder (6A06)

6E60.0 Secondary speech or language syndrome

A syndrome that involves significant features related to speech or language development that do not fulfill the diagnostic requirements of any of the specific developmental speech or language disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Possible etiologies include a disease of the nervous system, sensory impairment, brain injury or infection.

Coding Note: This diagnosis should be assigned in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

6E60.Y Other specified secondary neurodevelopmental syndrome

Coding Note: Code also the causing condition

6E60.Z **Secondary neurodevelopmental syndrome, unspecified**

Coding Note: Code also the causing condition

6E61 **Secondary psychotic syndrome**

A syndrome characterised by the presence of prominent hallucinations or delusions judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Acute and transient psychotic disorder (6A23)

Delirium (6D70)

Mood disorders (6A60-6A8Z)

6E61.0 **Secondary psychotic syndrome, with hallucinations**

A syndrome characterised by the presence of prominent hallucinations that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Delusions are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

Mood disorders (6A60-6A8Z)

6E61.1 **Secondary psychotic syndrome, with delusions**

A syndrome characterised by the presence of prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Hallucinations are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

Mood disorders (6A60-6A8Z)

6E61.2 **Secondary psychotic syndrome, with hallucinations and delusions**

A syndrome characterised by the presence of both prominent hallucinations and prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

Mood disorders (6A60-6A8Z)

6E61.3 **Secondary psychotic syndrome, with unspecified symptoms**

Coding Note: Code also the causing condition

6E62 Secondary mood syndrome

A syndrome characterised by the presence of prominent mood symptoms (i.e., depression, elevated mood, irritability) judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E62.0 Secondary mood syndrome, with depressive symptoms

A syndrome characterised by the presence of prominent depressive symptoms such as persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful and downtrodden appearance that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E62.1 Secondary mood syndrome, with manic symptoms

A syndrome characterised by the presence of prominent manic symptoms such as elevated, euphoric, irritable, or expansive mood states, rapid changes among different mood states (i.e., mood lability), or increased energy or activity that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings.

Coding Note: Code also the causing condition

Inclusions: mood syndrome due to disorders or diseases not classified under Mental and behavioural disorders, with manic symptoms

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E62.2 **Secondary mood syndrome, with mixed symptoms**

A syndrome characterised by the presence of both manic and depressive symptoms, either occurring together or alternating from day to day or over the course of a day that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. Manic symptoms may include elevated, euphoric, irritable, or expansive mood states, rapid changes among different mood states (i.e., mood lability), or increased energy or activity. Depressive symptoms may include persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful or downtrodden appearance. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E62.3 **Secondary mood syndrome, with unspecified symptoms**

Coding Note: Code also the causing condition

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E63 **Secondary anxiety syndrome**

A syndrome characterised by the presence of prominent anxiety symptoms judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., anxiety symptoms or panic attacks in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the anxiety symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Adjustment disorder (6B43)

Delirium (6D70)

6E64 **Secondary obsessive-compulsive or related syndrome**

A syndrome characterised by the presence of prominent obsessions, compulsions, hoarding, skin picking, hair pulling, other body-focused repetitive behaviours, or other symptoms characteristic of obsessive-compulsive and related disorder that is judged to be the direct pathophysiological consequence of a disorder or disease not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by Delirium or by another Mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., repetitive ruminations in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the obsessive-compulsive or related symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

Obsessive-compulsive or related disorder induced by other specified psychoactive substance (6C4E.72)

Tic disorders (8A05)

6E65 **Secondary dissociative syndrome**

A syndrome characterised by the presence of prominent dissociative symptoms (e.g., depersonalization, derealization) that is judged to be the direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the dissociative symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

Acute stress reaction (QE84)

6E66 **Secondary impulse control syndrome**

A syndrome characterised by the presence of prominent symptoms that are characteristic of Impulse Control Disorders or Disorders Due to Addictive Behaviours (e.g., stealing, fire-setting, aggressive outbursts, compulsive sexual behaviour, excessive gambling) that are judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an adjustment disorder in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the impulse control symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Delirium (6D70)

6E67 **Secondary neurocognitive syndrome**

A syndrome that involves significant cognitive features that do not fulfill the diagnostic requirements of any of the specific neurocognitive disorders and are judged to be a direct pathophysiological consequence of a health condition or injury not classified under mental and behavioural disorders (e.g., cognitive changes due to a brain tumour), based on evidence from the history, physical examination, or laboratory findings. This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the cognitive symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

Coded Elsewhere: Delirium (6D70)

6E68 **Secondary personality change**

A syndrome characterised by a persistent personality disturbance that represents a change from the individual's previous characteristic personality pattern that is judged to be a direct pathophysiological consequence of a health condition not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., social withdrawal, avoidance, or dependence in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the personality symptoms are sufficiently severe to warrant specific clinical attention.

Coding Note: Code also the causing condition

Exclusions: Personality difficulty (QE50.7)

Personality disorder (6D10)

Delirium (6D70)

6E69 **Secondary catatonia syndrome**

Secondary catatonia syndrome is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abormal psychomotor activity, which occurs as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

Coding Note: Use additional code, if desired, for any underlying disorder if known.

6E6Y **Other specified secondary mental or behavioural syndrome**

Coding Note: Code also the causing condition

6E6Z **Secondary mental or behavioural syndrome, unspecified**

Coding Note: Code also the causing condition

6E8Y **Other specified mental, behavioural or neurodevelopmental disorders**

6E8Z **Mental, behavioural or neurodevelopmental disorders, unspecified**

CHAPTER 07

Sleep-wake disorders

This chapter has 42 four-character categories.

Code range starts with 7A00

Sleep-wake disorders are characterised by difficulty initiating or maintaining sleep (insomnia disorders), excessive sleepiness (hypersomnolence disorders), respiratory disturbance during sleep (sleep-related breathing disorders), disorders of the sleep-wake schedule (circadian rhythm sleep-wake disorders), abnormal movements during sleep (sleep-related movement disorders), or problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep (parasomnia disorders).

This chapter contains the following top level blocks:

- Insomnia disorders
- Hypersomnolence disorders
- Sleep-related breathing disorders
- Circadian rhythm sleep-wake disorders
- Sleep-related movement disorders
- Parasomnia disorders

Insomnia disorders (7A00-7A0Z)

Insomnia disorders are characterised by the complaint of persistent difficulty with sleep initiation, duration, consolidation, or quality that occurs despite adequate opportunity and circumstances for sleep, and results in some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder.

7A00 Chronic insomnia

Chronic insomnia is a frequent and persistent difficulty initiating or maintaining sleep that occurs despite adequate opportunity and circumstances for sleep and that results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. The sleep disturbance and associated daytime symptoms occur at least several times per week for at least 3 months. Some individuals with chronic insomnia may show a more episodic course, with recurrent episodes of sleep/wake difficulties lasting several weeks at a time over several years. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, chronic insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

7A01 Short-term insomnia

Short-term insomnia is characterised by difficulty initiating or maintaining sleep of less than 3 months duration that occurs despite adequate opportunity and circumstances for sleep and results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, short-term insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

7A0Z Insomnia disorders, unspecified

Hypersomnolence disorders (7A20-7A2Z)

Hypersomnolence disorders are characterised by a complaint of daytime sleepiness that is not due to another sleep-wake disorder (e.g. disturbed nocturnal sleep, misaligned circadian rhythm, or breathing disorder). Individuals with excessive sleepiness may show irritability, concentration and attention deficits, reduced vigilance, distractibility, reduced motivation, anergia, dysphoria, fatigue, restlessness, and lack of coordination.

7A20 Narcolepsy

Narcolepsy is a disorder characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months, accompanied by abnormal manifestations of REM sleep. Multiple sleep latency testing (MSLT) demonstrates a mean sleep latency of <8 minutes and two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography (PSG). Nighttime sleep is often disturbed, and brief daytime naps are typically refreshing.

7A20.0 Narcolepsy, Type 1

Type 1 narcolepsy is a disorder of excessive sleepiness due to a deficiency of hypothalamic hypocretin (orexin) signaling. In addition to daily periods of irrepressible need to sleep or daytime lapses into sleep, type 1 narcolepsy is characterised by symptoms of REM sleep dissociation, most importantly cataplexy. Cataplexy is a sudden and uncontrollable loss of muscle tone arising during wakefulness that is typically triggered by a strong emotion, such as excitement or laughter. Although cataplexy is a pathognomonic symptom of type 1 narcolepsy, it may not manifest until years following onset of the sleepiness. In such cases, a diagnosis of narcolepsy, type 1 may be made based on cerebrospinal fluid (CSF)-hypocretin levels < 110 picograms per milliliter. Episodes of sleep paralysis and hypnagogic or hypnopompic hallucinations may also be present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep plus either: a) cataplexy and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy; or b) demonstrated CSF hypocretin deficiency.

7A20.1 Narcolepsy, Type 2

Type 2 narcolepsy is a disorder of excessive sleepiness characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep and abnormal manifestations of REM sleep as demonstrated by multiple sleep latency test (MSLT/PSG) findings in the context of normal hypothalamic hypocretin (orexin) signaling. That is, cerebrospinal fluid (CSF) hypocretin determinations are > 110 picograms per milliliter. Cataplexy is not present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy. There should be no evidence of cataplexy or CSF hypocretin deficiency (if testing is performed).

7A20.Z Narcolepsy, unspecified

7A21

Idiopathic hypersomnia

Idiopathic hypersomnia is characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months in the absence of cataplexy or hypocretin deficiency (if determined). Polysomnography/multiple sleep latency test (MSLT) findings characteristic of narcolepsy (i.e., two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography) should also be absent. The daytime sleepiness is not better explained by another disorder (e.g., insufficient sleep syndrome, obstructive sleep apnoea, circadian rhythm sleep-wake disorder), a substance or medication, or a medical condition). Objective evidence of hypersomnolence is indicated by an MSLT showing a mean sleep latency of ≤ 8 minutes or by polysomnography or wrist actigraphy showing a total 24-hour sleep time of 11 hours or more. Prolonged and severe sleep inertia is often observed and consists of sustained difficulty waking up with repeated returns to sleep, irritability, automatic behaviour, and confusion. In contrast to narcolepsy, naps are generally long, often more than 60 minutes, and unrefreshing.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep, objective demonstration of excessive sleepiness and absence of REM-related findings by multiple sleep latency test (MSLT/PSG).

7A22

Kleine-Levin syndrome

Kleine-Levin syndrome is characterised by recurrent episodes of severe sleepiness in association with cognitive, psychiatric, and behavioural disturbances. A typical episode lasts a median of 10 days (range 2.5–80 days), with rare episodes lasting several weeks to months. During episodes, patients may sleep as long as 16 to 20 hours per day, waking or getting up only to eat and void. When awake during episodes, most patients are exhausted, apathetic, confused, and slow in speaking and answering. Hyperphagia, hypersexuality, childish behaviour, depression, anxiety, hallucinations and delusions are often observed during the episodes. Patients are normal between episodes with regard to sleep, cognition, mood, and eating. Rarely, Kleine Levin syndrome may occur exclusively during menstrual periods.

Inclusions: recurrent hypersomnolence

7A23

Hypersomnia due to a medical condition

Hypersomnia due to a medical condition is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping of at least several months duration that is attributable to a coexisting medical or neurological disorder (e.g. head trauma, Parkinson disease, certain genetic conditions, metabolic, neurologic or endocrine disorders) and is sufficiently severe to require an independent focus of clinical attention. Hypersomnia due to a medical condition is only diagnosed if the hypersomnia is a direct physiological consequence of the medical condition. Residual sleepiness in patients with adequately-treated obstructive sleep apnoea is classified here under the assumption that it is due to central nervous system damage from recurrent hypoxemia.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

7A24 **Hypersomnia due to a medication or substance**

Hypersomnia due to a medication or substance is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is attributable to the sedating effects of medications, alcohol, or other psychoactive substances, including withdrawal syndromes (e.g., from stimulants) and is sufficiently severe to constitute an independent focus of clinical attention.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

Inclusions: Hypersomnia due to substances including medications

7A25 **Hypersomnia associated with a mental disorder**

Hypersomnia associated with a mental disorder is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is sufficiently severe to constitute an independent focus of clinical attention. This is most typical of depressive disorders or the depressed phase of bipolar disorders. Patients often feel that their sleep is of poor quality and nonrestorative and may be intensely focused on their hypersomnolence. Objective evidence of excessive sleepiness on MSLT is often absent.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

7A26 **Insufficient sleep syndrome**

Insufficient sleep syndrome occurs when an individual persistently fails to obtain the amount of sleep required relative to their own physiological sleep requirements to maintain normal levels of alertness and wakefulness and is thus chronically sleep deprived. The curtailed sleep pattern is present most days for at least several months.

The person’s ability to initiate and maintain sleep is unimpaired. Sleep time is often markedly extended on weekend nights or during holidays compared to weekday. Extension of total sleep time results in resolution of the symptoms of sleepiness.

Inclusions: Behaviourally induced hypersomnia

Exclusions: Narcolepsy (7A20)

7A2Y **Other specified hypersomnolence disorders**

7A2Z **Hypersomnolence disorders, unspecified**

Sleep-related breathing disorders (7A40-7A4Z)

Sleep related breathing disorders are characterised by abnormalities of respiration during sleep. In some of these disorders, respiration is also abnormal during wakefulness. The disorders are grouped into central sleep apnoeas, obstructive sleep apnoea, and sleep related hypoventilation or hypoxemia disorders.

Exclusions: Apnoea of newborn (KB2A)

Coded Elsewhere: Sleep related Cheyne-Stokes respiration (MD11.4)

7A40 Central sleep apnoeas

Central sleep apnoeas are characterised by reduction or cessation of airflow due to absent or reduced respiratory effort. Central apnoea (cessation of airflow) or hypopnea (reduction in airflow) may occur in a cyclical or intermittent fashion. Patients with central sleep apnoea of various etiologies may also exhibit obstructive events, in which case diagnoses of both central sleep apnoea and obstructive sleep apnoea may be given.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

Exclusions: Central neonatal apnoea (KB2A.0)

7A40.0 Primary central sleep apnoea

Primary central sleep apnoea is of unknown etiology (idiopathic) and is characterised by recurrent, predominantly central apnoeas. Airflow and respiratory effort cease simultaneously in a repetitive fashion over the course of the night. The recurrent episodes of apnoea (more than five per hour) and associated arousals are sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

Exclusions: Primary central sleep apnoea of infancy (7A40.1)

Primary central sleep apnoea of prematurity (7A40.2)

7A40.1 Primary central sleep apnoea of infancy

Primary central sleep apnoea of infancy is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of at least 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneas are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

Exclusions: Primary central sleep apnoea of prematurity (7A40.2)

7A40.2 Primary central sleep apnoea of prematurity

Primary central sleep apnoea of prematurity is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of less than 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneas are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

Exclusions: Primary central sleep apnoea of infancy (7A40.1)

7A40.3 Central sleep apnoea due to a medical condition with Cheyne-Stokes breathing

Central sleep apnoea due to a medical condition with Cheyne-Stokes breathing is characterised by recurrent, predominantly central apnoeas or central hypopneas (more than five per hour) alternating with a respiratory phase exhibiting a crescendo-decrescendo pattern of flow (or tidal volume) that are attributed to a medical condition. The longer cycle length (> 40 seconds) distinguishes Central sleep apnoea with Cheyne-Stokes breathing from other central sleep apnoea types. The vast majority of patients with Central sleep apnoea due to a medical condition with Cheyne-Stokes breathing have either systolic or diastolic heart failure. Patients with Central sleep apnoea due to a medical condition with Cheyne-Stokes breathing have normal or low daytime arterial partial pressure of carbon dioxide (PaCO2). The disturbance is typically associated with atrial fibrillation/flutter, congestive heart failure, or a neurological disorder and is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography in the presence of a medical condition that is judged to be causing the symptoms.

7A40.4 Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing

Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing is characterised by recurrent, predominantly central apnoeas or central hypopneas (more than five per hour) that are attributed to a medical condition (and do not have the pattern of CSB). The majority of these patients have brainstem lesions of developmental, vascular, neoplastic, degenerative, demyelinating, or traumatic origin. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnea, or snoring

Note: A definitive diagnosis requires objective evidence based on polysomnography in the presence of a medical condition that is judged to be causing the symptoms.

Exclusions: Central sleep apnoea due to a medication or substance (7A40.6)

7A40.5 Central sleep apnoea due to high-altitude periodic breathing

High-altitude periodic breathing is characterised by alternating periods of central apnoea and hyperpnoea associated with recent ascent to high altitude (typically > 2500 meters). The pattern of periodic breathing is an expected response to ascent to elevation. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. The cycle length of this respiratory pattern is commonly less than 40 seconds and often as short as 12 to 20 seconds.

Note: This diagnosis can be made clinically based on symptoms and recent ascent to high altitude.

7A40.6 Central sleep apnoea due to a medication or substance

Central sleep apnoea due to a medication is characterised by a pattern of recurring, predominantly central sleep apnoea or hypopnoea (more than five per hour) that is attributable to a medication or substance, most commonly long-acting opioids (e.g. methadone, long-acting morphine or oxycodone, fentanyl patches). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. Obstructive apnoeas and hypoventilation may be present, but central sleep apnoea is the predominant finding.

Note: A definitive diagnosis requires objective evidence based on polysomnography in the context of medication or substance use that is judged to be causing the symptoms.

7A40.7 Treatment-emergent central sleep apnoea

Treatment-emergent central sleep apnoea is characterised by persistence or emergence of recurrent, predominantly central sleep apnoea (more than five per hour) during effective treatment for obstructive apnoea (obstructive or mixed apnoea or hypopnea) with positive airway pressure. Central apnoeas must be the predominant finding (>50% of total respiratory events). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnea, or snoring. If the reduction or cessation of airflow due to absent or reduced respiratory effort is better explained by another central sleep apnoea disorder (e.g., Central sleep apnoea due to a medication or substance), that diagnosis along with a diagnosis of Obstructive sleep apnoea should be given, rather than a diagnosis of treatment-emergent central sleep apnoea.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

7A40.Y Other specified central sleep apnoeas

7A40.Z Central sleep apnoeas, unspecified

7A41 Obstructive sleep apnoea

Obstructive sleep apnoea is characterised by repetitive episodes of apnoea or hypopnea that are caused by upper airway obstruction occurring during sleep. These events often result in reductions in blood oxygen saturation and are usually terminated by brief arousals from sleep. Excessive sleepiness is a major presenting complaint in many but not all cases. Reports of insomnia, poor sleep quality, and fatigue are also common. Upper airway resistance syndrome shares the same pathophysiology and should be classified here. In adults (> 18 years), obstructive sleep apnoea is diagnosed when the frequency of obstructive events (apnoeas, hypopneas or respiratory-event related arousals) is greater than 15 per hour. The disorder may also be diagnosed when the frequency is greater than five per hour and: a) symptoms attributable to the disorder (e.g., sleepiness or sleep disruption) are present; or b) nocturnal respiratory distress or observed apnoea/habitual snoring are reported; or c) when hypertension, a mood disorder, cognitive dysfunction, coronary artery disease, stroke, congestive heart failure, atrial fibrillation, or type 2 diabetes mellitus are present. In children, the disorder is diagnosed when the frequency of obstructive events is great than one per hour, accompanied by signs or symptoms related to the breathing disorder.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

Exclusions: Obstructive neonatal apnoea (KB2A.1)

7A42 Sleep-related hypoventilation or hypoxemia disorders

The primary feature of these disorders is insufficient sleep related ventilation, resulting in abnormally elevated arterial partial pressure of carbon dioxide (PaCO2) during sleep. Sleep-related hypoxemia is diagnosed when overnight monitoring reveals sustained (> 5 minutes) decline in oxygen saturation to ≤ 88% in adults (or ≤ 90% in children) for ≥ 5 minutes.

Note: A definitive diagnosis requires objective evidence based on polysomnography as well as carbon dioxide (CO2) monitoring during sleep (by arterial, end-tidal or transcutaneous measures).

7A42.0 Obesity hypoventilation syndrome

Obesity hypoventilation syndrome is characterised by obesity (in adults, > 30 kg/m2) and daytime hypercapnia indicated by arterial partial pressure of carbon dioxide (PaCO2) > 45 mm Hg that cannot be fully attributed to an underlying cardiopulmonary or neurologic disease. Hypercapnia worsens during sleep and is often associated with severe arterial oxygen desaturation. Obstructive sleep apnoea is also present in the majority of cases and should be diagnosed in addition to obesity hypoventilation.

Note: A definitive diagnosis requires demonstration of daytime hypercapnia and objective evidence based on polysomnography, with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures.

Inclusions: Pickwickian syndrome

7A42.1 Congenital central alveolar sleep-related hypoventilation

Congenital central alveolar hypoventilation syndrome (CCHS) is a disorder of autonomic dysfunction, primarily the failure of automatic central control of breathing, caused by a mutation of the PHOX2B gene. CCHS is characterised by hypoventilation, which is worse during sleep than wakefulness. Onset is usually at birth, and CCHS most commonly presents in an otherwise normal-appearing infant who is noted to have cyanosis, feeding difficulties, hypotonia or, less commonly, central apnoea. Severity is related to the specific mutation present. Individuals with milder variants of the disorder may not present for clinical attention until adulthood.

Note: A definitive diagnosis requires demonstration of PHOX2B mutation and objective evidence based on polysomnography with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures).

7A42.2 Non-congenital central hypoventilation with hypothalamic abnormalities

Non-congenital central hypoventilation with hypothalamic dysfunction is a disorder of central control of ventilation. Patients are usually healthy until early childhood (often 2-3 years of age) when they develop hyperphagia and severe obesity, followed by central hypoventilation, which often presents as respiratory failure. Hypothalamic endocrine dysfunction may be characterised by increased or decreased hormone levels and may include one or more of the following: diabetes insipidus, inappropriate antidiuretic hormone hypersecretion, precocious puberty, hypogonadism, hyperprolactinemia, hypothyroidism, and decreased growth hormone secretion, or tumours of neural origin. Mood and behaviour abnormalities, sometimes severe, are often present. Developmental delay or autistic features may be present, but many patients are cognitively normal.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures.

7A42.3 Idiopathic central alveolar hypoventilation

Idiopathic central alveolar hypoventilation is defined as the presence of decreased alveolar ventilation resulting in sleep related hypercapnia and hypoxemia in individuals with presumed normal mechanical properties of the lung and respiratory pump. Chronic hypoventilation during sleep exists without any readily identifiable impairments of respiration, such as pulmonary airway or parenchymal conditions, neurologic, neuromuscular or chest wall abnormalities, severe obesity, other sleep related breathing disorder, or use of respiratory depressant medications or substances. Diurnal as well as nocturnal hypoventilation is believed to be due primarily to blunted chemoresponsiveness to carbon dioxide (CO2) and oxygen (O2). Patients may complain of morning headaches, fatigue, neurocognitive decline and sleep disturbance, or may be entirely asymptomatic.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures).

7A42.4 Sleep-related hypoventilation due to a medication or substance

Sleep-related hypoventilation due to a medication or substance is characterised primarily by chronic hypoventilation and hypercapnia due to prolonged use of medications or substances known to depress ventilatory drive and/or impair respiratory muscle mechanics (e.g. long-acting narcotics, anesthetics, sedative compounds, and muscle relaxants). Hypoxemia is commonly present as well. Hypercapnia may also be present during wakefulness in some patients. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures) in the context of medication or substance use that is judged to be causing the symptoms.

7A42.5 Sleep-related hypoventilation due to medical condition

Sleep-related hypoventilation due to medical condition is characterised by sleep-related hypoventilation due to lung airway or parenchymal disease, chest wall disorders, pulmonary hypertension, neurologic and neuromuscular disorders. Daytime hypercapnia may also be present. Sleep related hypoxemia may be severe. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO2) monitoring (by arterial, end-tidal or transcutaneous measures) in the presence of a medical condition that is judged to be causing the symptoms.

Exclusions: Obesity hypoventilation syndrome (7A42.0)

Congenital central alveolar sleep-related hypoventilation (7A42.1)

7A42.6 Sleep-related hypoxemia due to a medical condition

Sleep related hypoxemia due to a medical condition is characterised by sustained declines in SpO2 (≤ 88% in adults or ≤ 90% in children) for ≥ 5 minutes) during sleep. The condition is attributable to a medical or neurological disorder. The presence of hypoxemia is not better explained by another sleep related breathing disorder (e.g., obstructive sleep apnoea). Although some amount of obstructive or central apnoea may be present, these disorders are not thought to be primarily responsible for the hypoxemia during sleep. Some patients with sleep related hypoxemia also exhibit hypoxemia during wakefulness. If the presence of hypercapnia has been established, a diagnosis of sleep-related hypoventilation should be made, rather than sleep-related hypoxemia.

Note: A definitive diagnosis requires objective evidence based on polysomnographic monitoring of oxygen saturation (SaO2) in the presence of a medical condition that is judged to be causing the declines in SaO2.

7A42.Y Other specified sleep-related hypoventilation or hypoxemia disorders

7A42.Z Sleep-related hypoventilation or hypoxemia disorders, unspecified

7A4Y Other specified sleep-related breathing disorders

7A4Z **Sleep-related breathing disorders, unspecified**

Circadian rhythm sleep-wake disorders (7A60-7A6Z)

Circadian rhythm sleep-wake disorders are disturbances of the sleep-wake cycle (typically manifest as insomnia, excessive sleepiness, or both) due to alterations of the circadian time-keeping system, its entrainment mechanisms, or a misalignment of the endogenous circadian rhythm and the external environment. Sleep logs and, if possible, actigraphy for a minimum of one week should be utilized to define the specific sleep-wake schedule disturbance.

Inclusions: Delayed sleep phase syndrome

Irregular sleep-wake pattern

7A60 **Delayed sleep-wake phase disorder**

Delayed sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent delay in the major sleep period compared to conventional or desired sleep times. The disorder results in difficulty falling asleep and difficulty awakening at desired or required times. When sleep is allowed to occur on the delayed schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

7A61 **Advanced sleep-wake phase disorder**

Advanced sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent advance (to an earlier time) of the major sleep period compared to conventional or desired sleep times. The disorder results in evening sleepiness (prior to the desired bedtime) and awakening earlier than the desired or required times. When sleep is allowed to occur on the advanced schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

7A62 **Irregular sleep-wake rhythm disorder**

Irregular sleep-wake rhythm disorder is characterised by absence of a clearly-defined cycle of sleep and wake. Sleep becomes distributed in multiple episodes of variable duration throughout the 24-hour period. Patients typically complain of insomnia and/or excessive daytime sleepiness as a result of the condition. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

7A63 **Non-24 hour sleep-wake rhythm disorder**

Non-24 hour sleep-wake rhythm disorder is characterised by periods of insomnia and/or daytime sleepiness, alternating with periods of relatively normal sleep, due to a lack of entrainment of the circadian clock to the 24-hour environmental cycle. The period length of the circadian/sleep-wake cycle is typically longer than 24 hours. Symptoms occur as the circadian-controlled sleep-wake propensity cycles in and out of phase with the environmental day-night cycle. The disorder is seen most commonly in individuals with complete blindness. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

7A64 **Circadian rhythm sleep-wake disorder, shift work type**

Circadian rhythm sleep-wake disorder, shift work type is characterised by complaints of insomnia and/or excessive sleepiness that occur as a result of work shifts that overlap with all or a portion of conventional nighttime sleep periods. The disorder is also associated with a reduction in total sleep time. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

7A65 **Circadian rhythm sleep-wake disorder, jet lag type**

Circadian rhythm sleep-wake disorder, jet lag type is characterised by a temporary mismatch between the timing of the sleep and wake cycle generated by the endogenous circadian clock and that of the sleep and wake pattern required by transmeridian travel across at least two time zones. Individuals complain of disturbed sleep, sleepiness and fatigue, somatic symptoms (e.g. gastrointestinal distress) or impaired daytime function. The severity and duration of symptoms is dependent on the number of time zones traveled, the ability to sleep while traveling, exposure to appropriate circadian times cues in the new environment, tolerance to circadian misalignment when awake during the biological night, and the direction of the travel. The symptoms result in significant distress or mental, physical, social, occupational or academic impairment.

7A6Z **Circadian rhythm sleep-wake disorders, unspecified**

Sleep-related movement disorders (7A80-7A8Z)

Sleep related movement disorders are primarily characterised by relatively simple, usually stereotyped, movements that disturb sleep or its onset. An exception is Restless legs syndrome, which is primarily a waking, sensorimotor experience but is included in Sleep-related movement disorders because it almost always also involves periodic limb movements during sleep.

Coded Elsewhere: REM sleep behaviour disorder (7B01.0)

7A80 Restless legs syndrome

Restless legs syndrome is a waking sensorimotor disorder characterised by a complaint of a strong, nearly irresistible urge to move the limbs. This urge to move is often but not always accompanied by other uncomfortable sensations felt deep inside the limbs. Although the legs are most prominently affected, a significant percentage of individuals with Restless legs syndrome describe some arm sensations. The symptoms of Restless legs syndrome are worse at rest, alleviated with movement, and predominant in the evening or night. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep). The vast majority of individuals with Restless legs syndrome also exhibit periodic limb movements during sleep. A separate diagnosis of Periodic limb movement disorder is not warranted in such cases because the limb movements during sleep are considered to be an expected part of Restless legs syndrome.

7A81 Periodic limb movement disorder

Periodic limb movement disorder is characterised by periodic episodes of repetitive (> 5/hour in children or > 15/hour in adults), highly stereotyped limb movements that occur during sleep, in conjunction with significant difficulties with sleep initiation or maintenance or fatigue that cannot be accounted for by another primary sleep disorder or other etiology. Specifically, when periodic limb movements are associated with Restless legs syndrome, narcolepsy or REM sleep behaviour disorder, a separate diagnosis of Periodic limb movement disorder is not warranted because the limb movements during sleep are considered an expected part of these disorders. Periodic limb movements occur most frequently in the lower extremities but may be seen in the arms as well. They may be associated with recurrent arousal from sleep, which gives rise to sleep disruption. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

7A82 Sleep-related leg cramps

Sleep related leg cramps are painful sensations in the leg or foot associated with sudden, involuntary muscle hardness or tightness, indicating a strong muscle contraction. They typically last from a few seconds to several minutes. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep).

7A83 **Sleep-related bruxism**

Sleep-related bruxism is characterised by repetitive, rhythmic jaw muscle contractions that occur during sleep These contractions can take the form of a repetitive phasic muscle contractions or isolated sustained jaw clenching (tonic contractions). These contractions during sleep produce tooth-grinding sounds. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or significant damage to the teeth.

7A84 **Sleep-related rhythmic movement disorder**

Sleep related rhythmic movement disorder is characterised by repetitive, stereotyped, and rhythmic motor behaviours that involve large muscle groups (e.g., banging head against pillow or mattress, head rolling, body rocking, body rolling). The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or result in bodily injury (e.g., due to falling out of bed).

7A85 **Benign sleep myoclonus of infancy**

Benign sleep myoclonus of infancy is characterised by repetitive myoclonic jerks that occur during sleep in neonates and infants. Benign sleep myoclonus of infancy is commonly confused with epilepsy. However, unlike the jerks of myoclonic seizures and myoclonic encephalopathy, the jerks of Benign sleep myoclonus of infancy occur exclusively during sleep. The jerks are often bilateral and massive, typically involving large muscle groups.

7A86 **Propriospinal myoclonus at sleep onset**

Propriospinal myoclonus at sleep onset consists of sudden myoclonic jerks of the trunk, hips, and knees in a fixed pattern that occur during the transition from wakefulness to sleep and, more rarely, during nighttime awakenings or upon awakening in the morning. The jerks arise mainly in spinally innervated muscles and thereafter propagate to rostral and caudal muscles at a low speed, typical of propriospinal pathways. The movements result in clinically significant difficulty with sleep initiation or maintenance.

7A87 **Sleep-related movement disorder due to a medical condition**

Sleep-related movement disorder due to a medical condition is characterised by sleep-related movement abnormalities that are directly attrib¬utable to an underlying neurological or medical condition. Many medical conditions, particularly diseases of the nervous system, may be associated with movement abnormali¬ties that are evident in wake and sleep. In some cases, the nocturnal manifestations of the movement abnormalities may be apparent before establishment of a firm neurological diagnosis. Once the pres¬ence of a medical or neurological condition is clearly established, this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

Coding Note: Code also the causing condition

7A88 **Sleep-related movement disorder due to a medication or substance**

Sleep-related movement disorder due to a medication or substance is characterised by sleep-related movement abnormalities that are directly attributable to the effect of a medication or substance. Many substances may be associated with movement abnormalities that are evident in wake and sleep. To the extent that the movement abnormality is an expected complication of the substance(s) involved (e.g., tardive dyskinesia or akathisia associated with neuroleptic usage), this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

7A8Y **Other specified sleep-related movement disorders**

7A8Z **Sleep-related movement disorders, unspecified**

Parasomnia disorders (7B00-7B0Z)

Parasomnias are problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep. Parasomnias may occur during non-rapid eye movement sleep (NREM), rapid eye movement sleep (REM), or during transitions to and from sleep. They encompass abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity.

7B00 **Disorders of arousal from non-REM sleep**

Disorders of arousal from non-REM sleep are characterised by experiences or behaviours such as confusion, ambulation, terror, or extreme autonomic arousal that typically arise as a result of incomplete arousals from deep non-REM (N3) sleep. An exception is sleep-related eating disorder, which has been observed to arise during all stages of non-REM sleep. This group of disorders is also characterised by partial or complete amnesia for the event, inappropriate or absent responsiveness to efforts by others to intervene or redirect the person during the episode, and limited (e.g., a single visual scene) or no associated cognition or dream imagery. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others (e.g., thrashing or striking out in response to efforts to restrain the individual).

7B00.0 **Confusional arousals**

Confusional arousals are characterised by mental confusion or confused behaviour (e.g., disorientation, being unresponsive, impaired or slow speech, poor memory) during a partial arousal from deep sleep. There is partial or complete amnesia for the events. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.

7B00.1 **Sleepwalking disorder**

Sleepwalking disorder is characterised by ambulation and other complex behaviours during a partial arousal from deep sleep.

7B00.2 Sleep terrors

Sleep terrors are characterised by episodes of abrupt terror during a partial arousal from deep sleep, typically beginning with a vocalization such as a frightening scream. The individual experiences intense fear accompanied by signs of autonomic arousal, such as mydriasis, tachycardia, tachypnea, and diaphoresis.

7B00.3 Sleep-related eating disorder

Sleep-related eating disorder is characterised by recurrent episodes of involuntary excessive or dangerous eating or drinking that occur during the main sleep period that are not attributable to the effects of a medication or substance. Episodes may involve consumption of peculiar forms or combinations of food or inedible or toxic substances or injurious or potentially injurious behaviours performed while in pursuit of food or while cooking food. There may be adverse health consequences from recurrent nocturnal binge eating of high calorie foods. There is partial or complete amnesia for the events.

7B00.Y Other specified disorders of arousal from non-REM sleep

7B00.Z Disorders of arousal from non-REM sleep, unspecified

7B01 Parasomnias related to REM sleep

Parasomnias related to REM sleep are characterised by experiences or behaviours such as vocalization or complex motor behaviours, sleep paralysis, or nightmares that are associated with REM sleep. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.

7B01.0 REM sleep behaviour disorder

REM sleep behaviour disorder is characterised by repeated episodes of sleep related vocalization or complex motor behaviours that are either documented by polysomnography to occur during REM sleep or are presumed to occur during REM sleep due to a clinical history of dream enactment. Polysomnographic recording (when performed) demonstrates REM sleep without atonia. The disorder may occur as an isolated, idiopathic form but is frequently associated with latent or manifest disease of the nervous system, especially alpha-synucleinopathies.

Note: A provisional diagnosis may be established on clinical grounds but definitive diagnosis requires polysomnographic demonstration of REM sleep without atonia.

7B01.1 Recurrent isolated sleep paralysis

Recurrent isolated sleep paralysis consists of recurrent inability to move the trunk and all of the limbs at sleep onset (hypnagogic) or upon awakening (hypnopompic) from sleep. Episodes typically last from a few seconds to a few minutes and cause clinically significant distress including bedtime anxiety or fear of sleep.

7B01.2 **Nightmare disorder**

Nightmare disorder is characterised by recurrent, vivid and highly dysphoric dreams, often involving threat to the individual, that generally occur during REM sleep and that often result in awakening with anxiety. The person is rapidly oriented and alert upon awakening.

Inclusions: Dream anxiety disorder

7B01.Y **Other specified parasomnias related to REM sleep**

7B01.Z **Parasomnias related to REM sleep, unspecified**

7B02 **Other parasomnias**

Other parasomnias include Hypnogogic exploding head syndrome, Sleep-related hallucinations, and abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity related to a medical condition or due to a medication or substance. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.

Coded Elsewhere: Nocturnal enuresis (6C00.0)

7B02.0 **Hypnagogic exploding head syndrome**

Hypnagogic exploding head syndrome is characterised by the perception of a sudden, loud noise or sense of a violent explosion in the head that typically occurs as the individual is falling asleep. On occasion, these episodes may occur with awakening during the night. They are associated with abrupt arousal following the event, often with a sense of fright.

Inclusions: Hypnagogic sensory disturbance

7B02.1 **Sleep-related hallucinations**

Sleep related hallucinations are hallucinatory experiences that occur at sleep onset (hypnagogic hallucinations) or on awakening from sleep (hypnopompic hallucinations). Sleep related hallucinations are predominantly visual but may include auditory, tactile, or kinetic phenomena.

7B02.2 **Parasomnia disorder due to a medical condition**

Parasomnia disorder due to a medical condition is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity that are directly attributable to an underlying neurological or medical condition.

7B02.3 **Parasomnia disorder due to a medication or substance**

Parasomnia disorder due to a medication or substance is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity that are directly attrib¬utable to the effect of a medication or substance.

7B0Y **Other specified parasomnia disorders**

7B0Z **Parasomnia disorders, unspecified**

7B2Y	**Other specified sleep-wake disorders**
7B2Z	**Sleep-wake disorders, unspecified**

CHAPTER 08

Diseases of the nervous system

This chapter has 204 four-character categories.

Code range starts with 8A00

This is a group of conditions characterised as being in or associated with the nervous system.

Exclusions: Endocrine, nutritional or metabolic diseases (Chapter 05)

Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Certain conditions originating in the perinatal period (Chapter 19)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Coded Elsewhere: Injuries of the nervous system

Neoplasms of the nervous system

Structural developmental anomalies of the nervous system (LA00-LA0Z)

Syndromes with central nervous system anomalies as a major feature (LD20)

Non-viral and unspecified infections of the central nervous system (1D00-1D0Z)

Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y)

Paralytic symptoms (MB50-MB5Z)

Dissociative neurological symptom disorder (6B60)

Diseases of the nervous system complicating pregnancy, childbirth or the puerperium (JB64.3)

This chapter contains the following top level blocks:

- Movement disorders
- Disorders with neurocognitive impairment as a major feature
- Multiple sclerosis or other white matter disorders
- Epilepsy or seizures
- Headache disorders
- Cerebrovascular diseases
- Spinal cord disorders excluding trauma
- Motor neuron diseases or related disorders
- Disorders of nerve root, plexus or peripheral nerves
- Diseases of neuromuscular junction or muscle
- Cerebral palsy
- Nutritional or toxic disorders of the nervous system
- Disorders of cerebrospinal fluid pressure or flow

- Disorders of autonomic nervous system
- Human prion diseases
- Disorders of consciousness
- Other disorders of the nervous system
- Postprocedural disorders of the nervous system
- Injuries of the nervous system
- Neoplasms of the nervous system

Movement disorders (8A00-8A0Z)

This is a group of involuntary movement disorders.

Coded Elsewhere: Restless legs syndrome (7A80)

Periodic limb movement disorder (7A81)

Hemifacial spasm (8B88.2)

8A00 **Parkinsonism**

Parkinsonism is a clinical syndrome characterised by four cardinal features: rest tremor, muscular rigidity, akinesia or bradykinesia, and postural disturbances which include shuffling gait and flexed posture and loss of postural reflexes. Bradykinesia and one other clinical feature is required to make a diagnosis of Parkinsonism. Parkinsonism may result from a variety of conditions including progressive neurodegenerative disorders such as Parkinson Disease or Atypical Parkinsonism where the progressive degeneration of nigral and other neurons leads to dopamine deficiency. Parkinsonism may also be a result of structural lesions such as strokes or tumours or blockage of dopamine receptors in the striatum by drugs such as neuroleptics.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Arthropathies (FA00-FA5Z)

8A00.0 **Parkinson disease**

Parkinson Disease is a gradual onset progressive degenerative disease whose cardinal manifestations include bradykinesia plus one of the following-tremor, rigidity or postural instability. Nonmotor manifestations include autonomic dysfunction and neuropsychiatric features.

8A00.00 Sporadic Parkinson disease

This is defined as Parkinson Disease occurring sporadically with no apparent mode of inheritance.

8A00.01 Familial Parkinson disease

Familial subtype of Parkinson Disease, a disorder caused by progressive dopaminergic neuron degeneration of the substantia nigra that is characterized by resting tremor, bradykinesia, and rigidity. Familial cases can be caused by mutations in LRRK2, PARK7, PINK1, PRKN, or SNCA genes.

8A00.0Y Other specified Parkinson disease

8A00.0Z Parkinson disease, unspecified

8A00.1 **Atypical parkinsonism**

Atypical parkinsonism is a term used to describe several neurodegenerative conditions where the degeneration extends beyond the substantia nigra and is more extensive than seen in conditions like Parkinson disease. The clinical picture is often more complex than PD and patients may have apraxia, supranuclear ophthalmoplegia or autonomic failure.

Coded Elsewhere: Multiple system atrophy, Parkinsonism (8D87.01)

Lewy body disease (8A22)

8A00.10 Progressive supranuclear palsy

Progressive supranuclear palsy (PSP) is a late-onset neurodegenerative disease characterised by supranuclear gaze palsy, postural instability, progressive rigidity, and mild dementia. Five clinical variants have been described with clinicopathological correlations: Classical PSP (Richardson's syndrome), and four atypical variants of PSP including PSP-Parkinsonism (PSP-P), PSP-Pure akinesia with gait freezing (PSP-PAGF), PSP-corticobasal syndrome (PSP-CBS), and PSP-progressive non fluent aphasia (PSP-PNFA).

8A00.1Y Other specified atypical parkinsonism

8A00.1Z Atypical parkinsonism, unspecified

8A00.2 **Secondary parkinsonism**

Secondary parkinsonism is a term used to describe Parkinsonism due to a known agent such as drugs, infections, toxins or structural lesions.

Coding Note: Code also the causing condition

8A00.20 Parkinsonism due to heredodegenerative disorders

Parkinsonism may occur as a result of more widespread heredodegenerative disorders. It is accompanied by other neurological findings such as dystonia, ataxia and dementia. Other family members may be affected.

Coding Note: Code also the causing condition

8A00.21 Hemiparkinsonism hemiatrophy syndrome

Hemiparkinsonism may follow hemiatrophy of the body due to an intrauterine or early neonatal cerebral damage.

8A00.22 Infectious or postinfectious parkinsonism

A syndrome caused by an infection with a bacterial, viral, fungal, or parasitic source, which occurs during or after the acute phase of the infection. This condition is characterised by tremors, slow movement, or stiffness of the arms and legs, similar to symptoms seen in Parkinson disease.

8A00.23 Vascular parkinsonism

Multiple lacunar infarcts or diffuse vascular disease of the brain can result in Parkinsonism-Imaging often shows multiple lacunar infarcts or diffuse white matter change. The dopamine transporter scan may be normal or abnormal depending upon the site of the infarcts.

8A00.24 Drug-induced parkinsonism

Parkinsonism due to prescription medications.

8A00.25 Post traumatic Parkinsonism

Parkinsonism may be a result of a major head trauma where it occurs in combination with other neurological findings such as weakness and pyramidal signs. It may also occur as a result of multiple blows to the head and may be associated with dementia. It is also called chronic traumatic encephalopathy.

8A00.26 Parkinsonism due to structural lesions

Parkinsonism occurring in the setting of a demonstrable structural lesion such as subdural hematoma and brain tumours. Neuroimaging such as Magnetic Resonance Imaging is very helpful. It has to be emphasized that small brain tumours such as meningioma may be an incidental finding in cases of otherwise typical PD.

8A00.2Y Other specified secondary parkinsonism

Coding Note: Code also the causing condition

8A00.2Z Secondary parkinsonism, unspecified

Coding Note: Code also the causing condition

8A00.3 **Functional parkinsonism**

Functional movement disorder with mixed features of functional tremor but also slowness and stiffness which can be demonstrated to be variable and internally inconsistent. No cause has been identified after investigation.

Inclusions: Psychogenic parkinsonism

8A00.Y **Other specified parkinsonism**

8A00.Z **Parkinsonism, unspecified**

8A01 Choreiform disorders

Chorea consists of irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another.

8A01.0 **Benign hereditary chorea**

Benign hereditary chorea should be considered in people with a relatively stable, nonprogressive chorea, in whom childhood onset and an autosomal dominant family history are present. Benign hereditary chorea can be associated with short stature and developmental delay. Larger deletions of causative gene, TITF-1, can cause a multisystem disorder with congenital hypothyroidism, hypotonia, and pulmonary problems.

8A01.1 **Secondary Chorea**

Chorea consists of irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another. Chorea can be seen in a variety of metabolic, immunological and other disorders and is termed secondary chorea.

Coding Note: Code also the causing condition

Exclusions: Benign hereditary chorea (8A01.0)

8A01.10 Huntington disease

Huntington disease (HD) is a rare neurodegenerative disorder of the central nervous system. HD is an autosomal dominant disorder due to a mutation resulting in an increased number of triplicate cytosine-adenine-guanine repeats on chromosome 4. The manifestations include chorea, dementia and personality changes. In the Westphal variant dystonia and parkinsonism are prominent. Neuroimaging revels caudate atrophy. A genetic test is available and may facilitate presymptomatic detection.

Inclusions: Huntington chorea

8A01.11 Chorea due to Huntington disease-like conditions

The clinical picture of Huntington Disease (HD) is closely mimicked by disorders with an autosomal dominant inheritance. The gene test for HDS is negative prompting the consideration of other disorders. These are called HD like (HDL diseases).

8A01.12 Chorea due to Dentatorubral pallidoluysian atrophy

Dentatorubropallidoluysian atrophy patients may have chorea as a major manifestation.

8A01.13 Chorea due to Wilson disease

Coding Note: Code also the causing condition

8A01.14 Chorea due to infectious or para-infectious causes

Coding Note: Code also the causing condition

8A01.15 Chorea due to systemic lupus erythematosus

Chorea may be a presenting manifestation of systemic lupus erythematosus (SLE) or may occur in established disease. It is associated with the presence of antiphospholipid antibodies.

8A01.16 Drug-induced chorea

Chorea may be due to prescribed and illicit drugs.

8A01.1Y Other specified secondary chorea

Coding Note: Code also the causing condition

8A01.1Z Secondary chorea, unspecified

Coding Note: Code also the causing condition

8A01.2 **Hemichorea or hemiballismus**

Ballism, meaning to throw in Greek, refers to violent, irregular flinging movements of the limbs primarily due to contractions of the proximal muscles. Hemiballism refers to movements involving upper and lower extremities on the same side with or without involvement of the face.

Hemichorea refers to hemibody chorea with brief non repetitive jerks affecting arm and leg on one side with or without involvement of the face.

8A01.20 Hemichorea

Hemichorea refers to hemibody chorea with brief non repetitive jerks affecting arm and leg on one side with or without involvement of the face.

8A01.21 Ballism

Ballism, "meaning to throw" in Greek, refers to violent, irregular flinging movements of the limbs primarily due to contractions of the proximal muscles.

8A01.22 Hemiballism

Hemiballism refers to movements involving upper and lower extremities on the same side with or without involvement of the face.

8A01.2Y Other specified hemichorea or hemiballismus

8A01.2Z Hemichorea or hemiballismus, unspecified

8A01.Y **Other specified choreiform disorders**

8A01.Z **Choreiform disorders, unspecified**

8A02 Dystonic disorders

Exclusions: athetoid cerebral palsy (8D21)

8A02.0 **Primary dystonia**

Primary Dystonia (Primary Torsion dystonia) are disorders where dystonia is the sole neurological manifestation. These disorders are slowly progressive and are of which may be familial-genetic or sporadic.

8A02.00 Benign essential blepharospasm

This is a neurological condition characterised by forcible closure of the eyelids due to involuntary and sustained contraction of the muscles around the eyes.

8A02.0Y Other specified primary dystonia

8A02.0Z Primary dystonia, unspecified

8A02.1 **Secondary dystonia**

This is dystonia – a disorder of involuntary muscle contractions – of an acquired nature. Causes include substance toxicity, injury, hypoxia and tumours.

Coding Note: Code also the causing condition

8A02.10 Drug-induced dystonia

This is dystonia due to medications either as an idiosyncratic side effect or due to overdose of medications.

8A02.11 Dystonia-plus

This is a group of heterogenous syndromes present with dystonia – a disorder of involuntary muscle contractions – along with other clinical features, but not in tandem with a neurodegenerative disease. Examples include myoclonus dystonia and dopa responsive dystonia.

8A02.12 Dystonia associated with heredodegenerative disorders

Dystonia occurring as a part of a more complex heredodegenerative disorder. It is not a pure dystonia and other neurological findings such as ataxia, pyramidal signs and cognitive issues may be seen.

8A02.1Y Other specified secondary dystonia

Coding Note: Code also the causing condition

8A02.1Z Secondary dystonia, unspecified

Coding Note: Code also the causing condition

8A02.2 Paroxysmal dystonia

Paroxysmal dyskinesias are a group of rare movement disorders characterised by their recurrent and episodic nature, arising from a background of normal motor activity and behaviour. These abnormal movements can manifest in the form of ballism, dystonia, chorea and athetosis or a combination of these.

8A02.3 Functional dystonia or spasms

Functional movement disorder presenting predominantly with mobile or fixed dystonic posturing which is incongruous with other causes of dystonia and may be responsive to placebo therapy or psychotherapy. Typically a clenched fist, inverted ankle or orbicularis oculis/platysma contraction with onset as a teenager or adult.

Functional dystonia or spasms where no cause has been identified after investigation.

8A02.Y Other specified dystonic disorders

8A02.Z Dystonic disorders, unspecified

8A03 Ataxic disorders

Disorders associated with ataxia. The word "ataxia", comes from the Greek word, " a taxis" meaning "without order or incoordination". The word ataxia means without coordination. People with ataxia have problems with coordination because parts of the nervous system that control movement and balance are affected. Ataxia may affect the fingers, hands, arms, legs, body, speech, and eye movements.

8A03.0 Congenital ataxia

Congenital Ataxia is defined as a lack of coordination due to congenital abnormalities in the cerebellum. It is usually nonprogressive.

8A03.1 **Hereditary ataxia**

A group of genetic disorders characterised by slowly progressive incoordination of gait and often associated with poor coordination of hands, speech, and eye movements

Exclusions: Metabolic disorders (5C50-5D2Z)

Cerebral palsy (8D20-8D2Z)

8A03.10 Friedreich ataxia

Friedreich ataxia is an autosomal recessive ataxia characterised by difficulties to coordinate movements, associated with neurological signs (dysarthria, loss of reflexes, decrease of deep sensation, pes cavus and scoliosis), cardiomyopathy and sometimes diabetes mellitus. It is due to a mutation in the fratxin gene.

Coded Elsewhere: Hereditary optic neuropathy associated with hereditary ataxias (8A03.15)

8A03.11 Ataxia due to Cerebrotendinous xanthomatosis

Ataxia in the setting of cerebrotendinous xanthomatosis, a rare autosomal recessive disorder of bile acid metabolism caused by a mutation in the CYP27A1 gene encoding mitochondrial enzyme sterol 27-hydroxylase. Accumulation of sterols in multiple tissues leads to premature cataracts and tendon xanthomas in late childhood, followed by progressive neurological dysfunction such as ataxia, dementia, and polyneuropathy.

8A03.12 Ataxia due to Refsum disease

Ataxia in the setting of Refsum disease, a rare autosomal recessive disorder caused by a mutation in the PHYH gene coding for peroxisomal phytanoyl-CoA hydroxylase or PEX7, coding for peroxin 7 receptor protein. Onset is is usually in late childhood, initially presenting with retinitis pigmentosa, with progression to ataxia and chronic polyneuropathy.

8A03.13 Ataxia due to abetalipoproteinemia

Ataxia in the setting of abetalipoproteinemia, a rare autosomal recessive disorder caused by a mutation of the MTP gene coding for microsomal triglyceride transfer protein which impairs the ability to produce very low density lipoprotein. All patients have fat malabsorption, acanthocytosis, hypocholesterolemia, and absent apolipoprotein B.

8A03.14 Hereditary episodic ataxia

Autosomal dominant disorders associated with intermittent episodes of cerebellar dysfunction, with normal functioning or minimal ataxia and nystagmus between episodes. The two major subtypes include EA1 and and EA2. EA1 is caused by a mutation of the KCNA1 gene coding and characterized by episodes triggered by exercise and muscle myokymia. EA2 is caused by a mutation in CACNA1A gene and involves more prolonged attacks of ataxia (lasting hours to days), and interictal residual ataxia with nystagmus.

8A03.15 Ataxia due to mitochondrial mutations

8A03.16 Spinocerebellar ataxia

Autosomal dominantly inherited ataxias associated with over 37 gene loci that involve progressive degeneration of the cerebellum and spinocerebellar tracts of the spinal cord, presenting with characteristic sensory loss, diminished tendon reflexes, Romberg sign, and positive Babinski sign(s).

8A03.1Y Other specified hereditary ataxia

8A03.1Z Hereditary ataxia, unspecified

8A03.2 **Non-hereditary degenerative ataxia**

Ataxia is characterized by incoordination, due to lesions in the cerebellum and efferent or afferent connections. Sporadic forms of ataxia that present without any family history or known genetic cause. Diagnosis is made after ruling out other causes of ataxia.

8A03.20 Late onset cerebellar cortical atrophy

This is a sporadic late onset cerebellar cortical atrophy with progressive ataxia. Neuropathologically it is characterised by diffuse cerebellar cortical lesions and absence of neuronal loss in the dorsomedial part of the inferior olives.

Exclusions: Hereditary ataxia (8A03.1)

8A03.2Y Other specified non-hereditary degenerative ataxia

8A03.2Z Non-hereditary degenerative ataxia, unspecified

8A03.3 **Acquired ataxia**

Ataxia that is caused by a variety of exogenous and endogenous factors and are not clearly hereditary. May be seen in the setting of drug toxicity, post-viral cerebellitis, acute disseminated encephalomyelitis, traumatic brain injury, hypoxia, heat stroke, Wernicke's encephalopathy, Miller Fisher syndrome, basilar migraine, or conversion reaction.

8A03.30 Ataxia due to alcoholic cerebellar degeneration

This is the most common form of acquired ataxia and occurs among people suffering from degeneration of the cerebellum as a result of chronic alcohol use.

8A03.3Y Other specified acquired ataxia

8A03.3Z Acquired ataxia, unspecified

8A03.Y **Other specified ataxic disorders**

8A03.Z **Ataxic disorders, unspecified**

8A04 Disorders associated with tremor

Tremor is an involuntary oscillation of a body part and is commonly classified according to the behavioural circumstances in which it occurs (1) Tremor may occur during attempted relaxation (rest tremor), during a voluntarily held posture (postural tremor), or during a voluntary movement (kinetic tremor).

8A04.0 **Enhanced physiological tremor**

This is a high frequency, low amplitude tremor present with posture or action. It represents an exacerbation of a physiologic tremor which may have been worsened by drugs, stress, anxiety, etc.

8A04.1 **Essential tremor or related tremors**

Essential tremor is the most common form of tremor of moderate frequency ranging from 7-12 Hz and presents as a postural and kinetic tremor of the hands. It may also be present in the head/neck, and voice.

Exclusions: tremor NOS (8A04)

8A04.2 **Rest tremor**

Resting tremors happen while the patient is sitting or lying down and relaxed. People who have a resting tremor can usually stop the tremor by deliberately moving the affected body part. It usually occurs in the setting of Parkinsonism.

8A04.3 **Secondary tremor**

Coding Note: Code also the causing condition

8A04.30 Tremor due to metabolic disorders

Involuntary oscillation of a body part due to metabolic disorders.

Coding Note: Code also the causing condition

8A04.31 Tremor due to chronic or acute substance use

Drug use can cause tremor or exacerbate an existing tremor.

Coding Note: Code also the causing condition

8A04.32 Tremor due to drug withdrawal

Coding Note: Code also the causing condition

8A04.33 Tremor due to certain specified central nervous system diseases

Coding Note: Code also the causing condition

8A04.3Y Other specified secondary tremor

Coding Note: Code also the causing condition

8A04.3Z Secondary tremor, unspecified

Coding Note: Code also the causing condition

8A04.4 **Functional tremor**

Functional movement disorder presenting predominantly with tremor. The tremor might be variable in frequency and distractible on testing, either entraining or ceasing in response to contralateral externally cued rhythmical movements provided by the examiner.

Functional tremor is that in which no cause has been identified after investigation.

8A04.Y **Other specified disorders associated with tremor**

8A04.Z **Disorders associated with tremor, unspecified**

8A05 **Tic disorders**

Disorders characterized by brief, sudden, repetitive movements (motor tics) or utterances (phonic or vocal tics) that are temporarily suppressible and are usually preceded by a strong urge to perform the tic. The most common cause of childhood-onset tics is Tourette Syndrome.

8A05.0 Primary tics or tic disorders

Primary tics or tic disorders are characterised by the presence of chronic motor and/or vocal (phonic) tics. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed, tics must have been present for at least one year, although they may not manifest consistently.

8A05.00 Tourette syndrome

Tourette syndrome is a chronic tic disorder characterised by the presence of both chronic motor tics and vocal (phonic) tics, with onset during the developmental period. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed as Tourette syndrome, both motor and vocal tics must have been present for at least one year, although they may not manifest concurrently or consistently throughout the symptomatic course.

Inclusions: Combined vocal and multiple motor tic disorder

8A05.01 Chronic motor tic disorder

Chronic motor tic disorder is characterised by the presence of motor tics over a period of at least one year, although they may not manifest consistently. Motor tics are defined as sudden, rapid, non-rhythmic, and recurrent movements.

Exclusions: Tourette syndrome (8A05.00)

8A05.02 Chronic phonic tic disorder

Chronic phonic tic disorder is characterised by the presence of phonic (vocal) tics over a period of at least one year, although they may not manifest consistently. Phonic tics are defined as sudden, rapid, non-rhythmic, and recurrent vocalizations.

Exclusions: Tourette syndrome (8A05.00)

8A05.03 Transient motor tics

Tics are sudden, non-rhythmic stereotyped movements such as blinking, sniffing, tapping, etc. They should have been present for less than 1 year.

8A05.0Y Other specified primary tics or tic disorders

8A05.0Z Primary tics or tic disorders, unspecified

8A05.1 Secondary tics

A tic disorder as a direct physiologic consequence of an antecedent infection, drugs or illness.

Coding Note: Code also the causing condition

8A05.10 Infectious or postinfectious tics

A tic disorder as a direct physiologic consequence of an antecedent infection.

8A05.11 Tics associated with developmental disorders

A tic disorder as a direct consequence of a developmental disorder.

8A05.1Y Other specified secondary tics

Coding Note: Code also the causing condition

8A05.1Z Secondary tics, unspecified

Coding Note: Code also the causing condition

8A05.Y **Other specified tic disorders**

8A05.Z **Tic disorders, unspecified**

8A06 Myoclonic disorders

Exclusions: myoclonic epilepsy (8A60-8A6Z)

Facial myokymia (8B88.1)

Dystonia-plus (8A02.11)

8A06.0 **Essential myoclonus**

This is a hereditary form of myoclonus, which is not usually associated with epilepsy or any other medical condition. Essential myoclonus tends to be stable without increasing in severity over time. More recently, it is believed that essential myoclonus may be the same as myoclonus-dystonia caused by a mutation in the sarcoglycan gene.

8A06.1 **Segmental myoclonus**

Rhythmic or semi-rhythmic involuntary contractions of muscle groups supplied by one or more contiguous segments of the brainstem and/or spinal cord.

8A06.2 **Focal myoclonus**

Sudden, involuntary twitching or jerking of a muscle or group of muscles which effects a localised area of the body.

8A06.20 Palatal myoclonus

Palatal myoclonus is usually a rhythmic, continuous movement of the muscles of the middle ear or palate, but can also include muscle of the eye, tongue, neck and diaphragm. The movement may be present in sleep or with distraction with a frequency of 1.5 to 3 Hz. Essential palatal myoclonus is more likely to have an associated rhythmic clicking noise compared to symptomatic palatal myoclonus.

8A06.21 Chronic hiccups

Chronic hiccup is a rare disorder causing repeated inspiratory spasms over periods of 48 hours or more.

8A06.2Y Other specified focal myoclonus

8A06.2Z Focal myoclonus, unspecified

8A06.Y **Other specified myoclonic disorders**

8A06.Z **Myoclonic disorders, unspecified**

8A07 **Certain specified movement disorder**

Neurologic motor disorder motor disorders that present with slowness of movement (bradykinesia or hypokinesia) or abnormal involuntary movements (hyperkinesias) as a result of genetic, infectious, toxic, metabolic, inflammatory, or vascular abnormalities.

Coded Elsewhere: Sleep-related movement disorders (7A80-7A8Z)

Hereditary spastic paraplegia (8B44.0)

8A07.0 **Stereotypies**

Stereotypy refers to simple or complex movements that repeat themselves continually and identically. These are usually not preceded by an uncomfortable feeling.

Coded Elsewhere: Autism spectrum disorder (6A02)

Rett syndrome (LD90.4)

8A07.00 Primary stereotypy

A stereotypy that occurs in typically developing child.

8A07.01 Secondary stereotypy

A constellation of repetitive stereotyped movements such as hand flapping, that occur in association with a genetic, metabolic, neurodevelopmental, neurodegenerative, paraneoplastic, or infectious disorder.

Coding Note: Code also the causing condition

8A07.0Y Other specified stereotypies

8A07.0Z Stereotypies, unspecified

8A07.1 **Akathisia**

8A07.2 **Excessive startle reflex**

Exaggerated startle reaction (eye blinking, muscle jerks, body spasms) that occur in response to unexpected stimuli. May be secondary to hyperkplexia, myoclonic neurological diseases, or neuropsychiatric disorders.

8A0Y **Other specified movement disorders**

Coding Note: Code also the causing condition

8A0Z **Movement disorders, unspecified**

Coding Note: Code also the causing condition

Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

8A20 **Alzheimer disease**

8A21 **Progressive focal atrophies**

Progressive cortical atrophies are neurodegenerative diseases with progressive impairment in a single cognitive domain secondary to circumscribed cerebral atrophy.

8A21.0 Posterior cortical atrophy

Benson's syndrome or Posterior Cortical Atrophy (PCA) refers to a clinical syndrome in which higher order visual processing is disrupted owing to a neurodegenerative disorder. The patients present with progressive and severe visual agnosia (inability to recognize and identify familiar objects or persons) and apraxia (loss in the ability to execute or perform skilled familiar movements).

8A21.Y Other specified progressive focal atrophies

8A21.Z Progressive focal atrophies, unspecified

8A22 **Lewy body disease**

Lewy body disease is a neurodegenerative disorder and the second most common form of dementia in the elderly after Alzheimer disease. Lewy bodies are histologically defined as intracytoplasmic eosinophilic neuronal inclusions in the cortex or brainstem.

8A23 **Frontotemporal lobar degeneration**

8A2Y **Other specified disorders with neurocognitive impairment as a major feature**

8A2Z **Disorders with neurocognitive impairment as a major feature, unspecified**

Multiple sclerosis or other white matter disorders (8A40-8A4Z)

This is a group of conditions involving demyelination, damage to the myelin sheath which protects nerve axons and is responsible for neurotransmission.

8A40 **Multiple sclerosis**

Multiple Sclerosis is a chronic, inflammatory demyelinating disease of the central nervous system. Three categories of multiple sclerosis have been outlined: Relapsing/remitting, secondary progressive and primary progressive multiple sclerosis

Coded Elsewhere: Retrobulbar neuritis in multiple sclerosis (9C40.1Y)

8A40.0 Relapsing-remitting multiple sclerosis

Clearly defined disease relapses with full recovery or with sequelae and residual deficit upon recovery. The periods between disease relapses are characterised by a lack of disease progression.

8A40.1 **Primary progressive multiple sclerosis**

Disease progression from onset, with occasional plateaus and temporary minor improvements allowed.

Coding Note: This category is to be used to indicate Primary progressive multiple sclerosis which is progressive from onset but includes progressive - relapsing, or is progressive from onset with a single relapse

8A40.2 **Secondary progressive multiple sclerosis**

Coding Note: This category is to be used to indicate Secondary progressive multiple sclerosis, after an initially relapsing/remitting course (includes remitting relapsing progressive, may have superimposed relapses)

8A40.Y **Other specified multiple sclerosis**

8A40.Z **Multiple sclerosis, unspecified**

8A41 Isolated demyelinating syndromes of the central nervous system

Clinically isolated syndrome (CIS) is the first clinical inflammatory demyelinating event of the central nervous system, lasting greater than 24 hours CIS is now recognised as the first clinical presentation of a disease that shows characteristics of inflammatory demyelination that could be MS, but has yet to fulfill criteria of dissemination in time.

Coded Elsewhere: Optic neuritis (9C40.1)

Idiopathic inflammatory optic neuropathy (9C40.1Y)

8A41.0 **Transverse myelitis**

Focal inflammatory and demyelinating disorder of the spinal cord, resulting in motor, sensory and autonomic dysfunction. Symptoms include Lhermitte's, numbness of the limbs, progressive spastic paraplegia, urinary urgency, incontinence and sexual dysfunction.

Coding Note: Code also the causing condition

8A41.1 **Neuromyelitis optica myelin oligodendrocyte glycoprotein antibody-positive**

MOG antibody associated spectrum disorders are inflammatory demyelinating diseases of the central nervous system with a predilection for optic nerve that include a subgroup of patients with bilateral optic neuritis (ON), longitudinally extensive (> 3 vertebral segments) myelitis (often recurrent) and rarely patients with an NMO like presentation. The clinical and immunopathological phenotype is under active investigation

8A41.Y **Other specified isolated demyelinating syndromes of the central nervous system**

8A41.Z **Isolated demyelinating syndromes of the central nervous system, unspecified**

8A42 Acute disseminated encephalomyelitis

Acute disseminated encephalomyelitis is a demyelinating disorder of the central nervous system. It usually develops after acute viral or bacterial infection or vaccination, with a sudden onset of irritability and lethargy after a prodromal period of 1-4 weeks. Major symptoms include fever, headache, drowsiness, changes in mental status, seizures and coma. Weakness, vomiting, weight loss, stiff neck, ataxia, bilateral optic neuritis and delirium are common. Peripheral nervous system involvement (paralysis of a single limb or hemiplegia) may occur.

8A42.0 Acute haemorrhagic leukoencephalitis

Rare, severe, rapidly progressive inflammatory and haemorrhagic demyelinating disorder of the central nervous system, considered a variant of ADEM.

8A42.Y Other specified acute disseminated encephalomyelitis

8A42.Z Acute disseminated encephalomyelitis, unspecified

8A43 Neuromyelitis optica

Coded Elsewhere: Neuromyelitis optica myelin oligodendrocyte glycoprotein antibody-positive (8A41.1)

8A43.0 Neuromyelitis optica aquaporin-4 antibody positive

Neuromyelitis optica (NMO) is an inflammatory demyelinating disease of the central nervous system characterised mainly by attacks of uni- or bilateral optic neuritis (ON) and acute longitudinally extensive (> 3 vertebral segments) myelitis. This form is seropositive for aquaporin-4 antibodies.

8A43.1 Neuromyelitis optica aquaporin-4 antibody negative

Neuromyelitis optica (NMO) is an inflammatory demyelinating disease of the central nervous system characterised mainly by attacks of uni- or bilateral optic neuritis (ON) and acute longitudinally extensive (> 3 vertebral segments) myelitis. This form is seronegative for aquaporin-4 antibodies.

Some patients may be myelin oligodendrocyte glycoprotein (MOG) antibody positive.

8A43.2 Single transverse myelitis aquaporin-4 antibody positive

A single episode of transverse myelitis which is typically longitudinally extensive (>3 vertebral segments) associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

8A43.3 Recurrent transverse myelitis aquaporin-4 antibody positive

Two or more episodes of transverse myelitis which is typically longitudinally extensive (>3 vertebral segments) associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

8A43.4 Single optic neuritis aquaporin-4 antibody positive

A single episode of optic neuritis associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

8A43.5 **Recurrent optic neuritis aquaporin-4 antibody positive**

Two or more episodes of optic neuritis associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

8A43.Y **Other specified neuromyelitis optica**

8A43.Z **Neuromyelitis optica, unspecified**

8A44 Leukodystrophies

Group of rare progressive genetic diseases that are caused by mutations in genes that lead to destruction of white matter of the brain by disrupting development of the myelin sheath. More than 50 different leukodystrophies have been identified, including Alexander disease Canavan disease, cerebrotendinous xanthomatosis, metachromatic leukodystrophy, Pelizaeus-Merzbacher disease, and Refsum disease.

Coded Elsewhere: Metachromatic leukodystrophy (5C56.02)

Canavan disease (5C50.E1)

Leukoencephalopathy with brainstem - spinal cord involvement - lactate elevation (5C53.23)

8A44.0 **Pelizaeus-Merzbacher disease**

Pelizaeus-Merzbacher disease (PMD) is an X-linked leukodystrophy characterised by developmental delay, nystagmus, hypotonia, spasticity, and variable intellectual deficit. It is classified into three sub-forms based on the age of onset and severity: connatal, transitional, and classic PMD.

Coded Elsewhere: Pelizaeus-Merzbacher-like disease (LD90.2)

8A44.1 **Adrenoleukodystrophy**

X-linked genetic disorder associated with accumulation of very-long-chain fatty acids in the brain and adrenal cortex due to a mutation in the ABCD1 gene causing defects in peroxisomal oxidation. Neurological symptoms can present in childhood or adulthood with almost all patients having concurrent adrenal insufficiency.

Coded Elsewhere: Zellweger syndrome (5C57.0)

Neonatal adrenoleukodystrophy (5A74.Y)

X-linked adrenoleukodystrophy (5C57.1)

8A44.2 **Alexander disease**

Alexander's disease is a neurodegenerative disorder encompassing different clinical forms: the infantile form (birth to 2 years), the most common, is characterised by its early onset and severe evolution with progressive megalencephaly (sometimes hydrocephaly), retarded psychomotor development or mental deterioration, pyramidal signs, ataxia and convulsive seizures. The juvenile forms start in school-aged children and associate spastic paraplegia and progressive bulbar signs. Adult forms are heterogeneous and difficult to diagnose.

8A44.3 Certain specified leukodystrophies

Coded Elsewhere: Phenylketonuria (5C50.0)
Refsum disease (5C57.1)
Cerebrotendinous xanthomatosis (5C52.11)
Leber hereditary optic neuropathy (8C73.Y)
Cystic leukoencephalopathy without megalencephaly (5C55.2)
Gaucher disease (5C56.0Y)
Niemann-Pick disease (5C56.0Y)
Tay-Sachs disease (5C56.00)
Oculo-dento-digital dysplasia (LD27.0Y)

8A44.4 Krabbe disease

Krabbe disease, also called globoid cell leukodystrophy, is a sphingolipidosis resulting from galactosylceramidase (or galactocerebrosidase) deficiency, a lysosomal enzyme that catabolizes a major lipid component of myelin. The disease leads to demyelination of the central and peripheral nervous system which is rapidly progressive from the first year of life, but juvenile, adolescent or adult onset forms have also been reported, with a more variable rate of progression.

8A44.Z Leukodystrophies, unspecified

8A45 Secondary white matter disorders

Coding Note: Code also the causing condition

8A45.0 White matter disorders due to infections

Coded Elsewhere: Tabes dorsalis (1A62.01)

8A45.00 Human T-cell lymphotropic virus-associated myelopathy

Human T-cell lymphotropic virus (HTLV) is a retrovirus and causes immune mediated diseases of the nervous system. Human T-cell lymphotropic virus type 1 (HTLV-1) and Human T-cell lymphotropic virus type 2 (HTLV-2) are closely related retroviruses with similar biological properties and common modes of transport.

Coded Elsewhere: Myelitis due to Human T-lymphotropic virus type 1 (1D02.1)

8A45.01 Subacute sclerosing panencephalitis

Inclusions: Dawson inclusion body encephalitis
Van Bogaert sclerosing leukoencephalopathy

8A45.02 Progressive multifocal leukoencephalopathy

8A45.0Y Other specified white matter disorders due to infections

8A45.0Z White matter disorders due to infections, unspecified

8A45.1 White matter disorders due to toxicity

Coded Elsewhere: Myelopathy due to radiation injury (8B42)

8A45.2 White matter disorders due to vascular abnormality or ischemia

8A45.20 White matter disorder due to CADASIL

8A45.21 Subacute necrotising myelitis

Foix-Alajouanine syndrome, also called subacute ascending necrotising myelitis, results from chronic congestion of the extrinsic pial veins of the spinal cord and of the intrinsic subpial network. It is characterised by progressive ascending deficit over a period of several months or years.

8A45.2Y Other specified white matter disorders due to vascular abnormality or ischemia

8A45.2Z White matter disorders due to vascular abnormality or ischemia, unspecified

8A45.3 White matter disorders due to nutritional deficiency

Damage to the white matter due to nutritional deficiency.

8A45.30 White matter disorder due to vitamin B12 deficiency

Neurological features occur in 40% of patients with B12 deficiency. Subacute combined degeneration is a potentially reversible neurological complication of a vitamin B12 deficiency. Symptoms develop insidiously and neuropathic manifestations include progressive paraesthesia distally, numbness, gait ataxia and diminished proprioception in the lower limbs, while the myelopathic component leads to variable motor impairment due to pyramidal tract dysfunction. Incontinence of bowel and bladder with impotence and postural hypotension occur as part of the myelopathy. Central manifestations include confusion, depression, progressive hallucination and mental slowing. There may also be optic neuropathy present.

8A45.31 Central pontine myelinolysis

8A45.3Y Other specified white matter disorders due to nutritional deficiency

8A45.3Z White matter disorders due to nutritional deficiency, unspecified

8A45.4 White matter disorders due to certain specified systemic disease

8A45.40 Demyelination due to sarcoidosis

Sarcoidosis can affect any part of the nervous system. It is estimated that about 5-15% of cases develop evidence of central nervous system involvement. Neurosarcoidosis may manifest in many different ways, diagnosis may be difficult. Neurosarcoidosis can appear in an acute explosive fashion or as a slow, chronic illness. Any part of the central nervous system can be attacked by sarcoidosis but chronic neurosarcodosis can cause multiple cranial nerve palsies, parenchymatous cerebral involvement, hydrocephalus and encephalopathy or peripheral nervous system manifestations.

8A45.41 Demyelination due to systemic lupus erythematosus

Among the 12 systemic lupus erythematosus (SLE)-related central nervous system (CNS) syndromes defined by the American College of Rheumatology (ACR), demyelinating syndrome and myelopathy are two of the less prevalent and more poorly understood ones. One important issue concerning demyelinating disease in SLE is that it can be easily misdiagnosed with other central nervous system demyelinating disorders such as multiple sclerosis (MS).

8A45.42 Demyelination due to Sjögren disease

8A45.43 Demyelination due to Behcet disease

8A45.44 Demyelination due to systemic vasculitis

The CNS vasculature can be targeted by systemic vasculitis and include the following conditions;

Small-Medium Vessel Vasculitis - Wegener's granulomatosis, microscopic polyangiitis, Churg-Strauss syndrome, Cryoglobulinemic vasculitis and Behçet's disease.

Medium Vessel Vasculitis - Polyarteritis nodosa

Large Vessel Vasculitis - Giant-cell arteritis, Takayasu's arteritis (Neurologic complications are mainly due to involvement of extracranial vessels).

Usually CNS involvement coexists with other clearly apparent systemic manifestations but some patients may present primarily with prominent symptoms of CNS dysfunction

8A45.45 Demyelination due to mitochondrial disease

Mitochondrial disorders can cause multifocal and relapsing central nervous system syndromes. Mitochondrial disorders which can cause such syndromes include Mitochondrial Encephalopathy with Lactic Acidosis and Stroke (MELAS), and Leigh's disease. MELAS is a progressive neurodegenerative disorder associated with headache, treatment resistant partial seizures, short stature, muscle weakness, exercise intolerance, deafness, diabetes, and slow progressive dementia. Leigh syndrome or subacute necrotizing encephalomyelopathy is the prototype mitochondrial disease, with hallmark neuroimaging findings.

8A45.4Z White matter disorders due to certain specified systemic disease, unspecified

8A45.Y **Other specified secondary white matter disorders**

Coding Note: Code also the causing condition

8A45.Z **Secondary white matter disorders, unspecified**

Coding Note: Code also the causing condition

8A46 **Central demyelination of corpus callosum**

This is demyelination, damage to the myelin sheath of neurons, in the corpus callosum.

8A4Y **Other specified multiple sclerosis or other white matter disorders**

8A4Z **Multiple sclerosis or other white matter disorders, unspecified**

Epilepsy or seizures (8A60-8A6Z)

At least 2 unprovoked (or reflex) seizures occurring more than 24 hours apart.

Coding Note: Use additional code, if desired, to identify the type of seizure.

Exclusions: Syncope (MG45)

Coded Elsewhere: Sudden unexpected death in epilepsy (MH15)

Neonatal seizures (KB06)

8A60 **Epilepsy due to structural or metabolic conditions or diseases**

Epilepsy occurring in relation to a distinct other structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy.

8A60.0 Epilepsy due to prenatal or perinatal brain insults

Epilepsy occurring in relation to a distinct structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy, with the insult occurring before birth [prenatal] or between 22 weeks of gestation and 7 days after birth. Onset of epilepsy may be in infancy, childhood, or adulthood.

Coding Note: Code also the causing condition

Exclusions: Neonatal seizures (KB06)

8A60.00 Epilepsy due to prenatal or perinatal vascular insults

Epilepsy occurring in relation to an ischemic stroke or haemorrhagic stroke, with the stroke occurring or presumed to occur before birth [prenatal] or between 22 weeks of gestation and 7 days after birth [perinatal]. No other conditions associated with a substantially increased risk of developing epilepsy are present. Onset of epilepsy may be in infancy, childhood, or adulthood.

Coding Note: Code also the causing condition

8A60.01 Epilepsy due to neonatal hypoxic ischemic encephalopathy

8A60.0Y Epilepsy due to other prenatal or perinatal brain insults

Coding Note: Code also the causing condition

8A60.0Z Epilepsy due to unspecified prenatal or perinatal brain insults

Coding Note: Code also the causing condition

8A60.1 Epilepsy due to cerebrovascular disorders

Epilepsy occurring in relation to a stroke, with onset at least one week following an ischemic or haemorrhagic stroke.

Coding Note: Code also the causing condition

8A60.2 Epilepsy due to degenerative brain disorders

Epilepsy in relation to a degenerative brain disorder known to be associated with seizures, such as certain neuronal storage disorders (e.g. adult neuronal ceroid lipofuscinosis), and certain mitochondrial disorders.

Coding Note: Code also the causing condition

8A60.3 **Epilepsy due to dementias**

Epilepsy with onset in a patient with established diagnosis of dementia. Seizures may occur at any time after the disease onset. Focal onset seizures are the prevailing type in Alzheimer's disease while seizures with bilateral convulsive activity predominate in other dementing disorders. Myoclonus is another common finding in patients with Alzheimer's disease.

Coding Note: Code also the causing condition

8A60.4 **Epilepsy due to central nervous system infections or infestations**

Epilepsy with onset in a patient with a documented CNS infection or infestation after the acute phase of the disease.

Coding Note: Code also the causing condition

8A60.5 **Epilepsy due to injuries to the head**

Epilepsy occurring in relation to a traumatic brain injury. Onset is more than 1 week following the trauma, with risk increasing with the severity of brain injury.

Coding Note: Code also the causing condition

8A60.6 **Epilepsy due to tumours of the nervous system**

Epilepsy occurring in relation to intracranial tumours. The epilepsy may be the presenting symptom of the tumour, which is located within or affects the cerebral cortex. The tumour may be a primary intracranial tumour or a metastatic tumour.

Coding Note: Code also the causing condition

8A60.7 **Epilepsy with mesial temporal sclerosis**

Epilepsy associated with imaging and/or pathologic findings of mesial temporal sclerosis. Onset of epilepsy may be in childhood or adulthood. A history of prolonged febrile seizures is common.

8A60.8 **Epilepsy due to immune disorders**

Epilepsy in relation to immunological or autoimmune disorders, such as systemic lupus erythematosus [1], inflammatory bowel disease [2], and antibody associated encephalitis (e.g. NMDA receptors) [3]. Antibody associated encephalitis is often a limbic encephalitis, and is sometimes paraneoplastic. Excludes multiple sclerosis and other demyelinating disorders.

Coding Note: Code also the causing condition

8A60.9 **Epilepsy due to abnormalities of brain development**

Epilepsy due to disorders of cortical development encompassing a wide range of etiologies, with effects that depend on the stage of brain development. Seizure types usually reflect the topology of the malformation.

Coding Note: Code also the causing condition

8A60.A **Epilepsy due to genetic syndromes with widespread or progressive effects**

Epilepsy due to genetically determined conditions in which, as we currently understand it, there is a separate disorder interposed between the genetic defect and the epilepsy, for example, as in tuberous sclerosis. Includes epilepsy due to documented autosomal, X-linked, mitochondrial or chromosomal abnormalities.

8A60.B **Epilepsy due to multiple sclerosis or other demyelinating disorders**

Epilepsy with onset in a patient with established diagnosis of multiple sclerosis (MS) or other demyelinating disorder. Seizures must occur during the disease course, but not in close temporal relationship with an acute phase. The duration of MS symptoms prior to first seizure is generally several years.

Coding Note: Code also the causing condition

8A60.Y **Epilepsy due to other structural or metabolic condition or disease**

8A60.Z **Epilepsy due to unspecified structural or metabolic condition or disease**

8A61 **Genetic or presumed genetic syndromes primarily expressed as epilepsy**

The epilepsy is, as best as understood, the direct result of a known or presumed genetic defects(s) in which seizures are the core symptom of the disorder.

8A61.0 **Genetic epileptic syndromes with neonatal onset**

Epilepsy with onset in the first 30 days of life resulting from known or presumed genetic defects(s) in which seizures are the core symptom of the disorder.

Exclusions: Neonatal seizures (KB06)

Epilepsy due to prenatal or perinatal brain insults (8A60.0)

8A61.00 Pyridoxal dependent epilepsy

Pyridoxal 5-phosphate dependent epilepsy usually presents with neonatal intractable seizures and is diagnosed by cerebrospinal fluid (CSF) analysis, gene testing, and clinical response. The majority of patients have pyridoxamine 5'-phosphate oxidase (PNPO) gene disease causing mutations. Early diagnosis and effective treatment can lead to a relatively favourable neurodevelopmental outcome.

8A61.0Y Other specified genetic epileptic syndromes with neonatal onset

8A61.0Z Genetic epileptic syndromes with neonatal onset, unspecified

8A61.1 **Genetic epileptic syndromes with onset in infancy**

Include a vast spectrum of phenotypes having in common a genetic background and the onset in infancy. They range from benign self-remitting to severe drug resistant syndromes. Family history of epilepsy is common in some syndromic entities and exceptional in others.

8A61.10 Benign familial infantile epilepsy

Epilepsy characterised by the occurrence of repeated seizures in healthy infants with no prior medical history during the first year of life. The seizures manifest with motor arrest, impairment of consciousness, staring, eye and head deviation, and mild unilateral clonic convulsions. A family history of the same epilepsy is a constant finding. The pattern of inheritance is most probably autosomal dominant.

8A61.11 Dravet syndrome

A refractory epileptic encephalopathy occurring in otherwise healthy infants during the first year of life with clonic/tonic-clonic, generalised and unilateral seizures, hemiclonic or generalised status epilepticus. The interictal EEG may initially be normal but with time background activity deteriorates and bilateral asymmetric, focal or multifocal paroxysms of polyspike and slow-waves appear. Mutations in the voltage-gated sodium channel gene SCN1A are commonly found.

8A61.12 Epilepsy of infancy with migrating focal seizures

Epilepsy syndrome with onset between the first week of life and seven months of intractable, polymorphous focal seizures. Psychomotor development progressively deteriorates. A mutation of SCN1A may be found. The EEG shows multifocal, varying sites of seizure onset, and diffuse slowing.

8A61.1Y Other specified genetic epileptic syndromes with onset in infancy

8A61.1Z Genetic epileptic syndromes with onset in infancy, unspecified

8A61.2 Genetic epileptic syndromes with childhood onset

8A61.20 Benign childhood epilepsy with centro-temporal spikes

Epilepsy characterised by focal seizures, mainly during sleep, often with involvement of the mouth and face. Convulsive seizures may occur. A history of febrile seizures is common. Onset is maximal between 7 and 10 years of age. The electroencephalogram typically shows focal epileptiform discharges over one or both centrotemporal areas. Remission occurs before age 16 years.

8A61.21 Childhood absence epilepsy

Epilepsy with onset in an otherwise normal child of 2 to 12 years of age, often with multiple daily brief staring episodes lasting an average of 10 seconds. Absence seizures are usually provoked by hyperventilation. The electroencephalogram shows ictal and interictal diffuse 2.5-3 cycles per second spike and wave discharges. The genetic pattern is probably polygenetic.

8A61.22 Epilepsy with myoclonic-astatic seizures

Epilepsy beginning between the second and fifth year of life in a previously normal child with family history of seizures, that initially manifests as tonic-clonic seizures with myoclonic-astatic seizures beginning several weeks later. These seizures are characterised by a sudden loss of muscular tonus associated with forward or backward propulsion that may result in injury to the face and head if the patient falls.

8A61.23 Myoclonic absences or absences with myoclonias

Childhood epileptic syndrome characterised by absence seizures associated with severe rhythmic bilateral myoclonic jerks. The EEG pattern shows rhythmic, bilateral, synchronous, symmetric 3-Hz spike and slow-waves discharges associated with EMG myoclonic bursts at 3 Hz, superimposed to a progressively increasing tonic contraction.

8A61.2Y Other specified genetic epileptic syndromes with childhood onset

8A61.2Z Genetic epileptic syndromes with childhood onset, unspecified

8A61.3 **Genetic epileptic syndrome with adolescent or adult onset**

Includes a wide array of epilepsy syndromes having a (presumed) genetic origin, with onset in adolescence or in adult life. The developmental background is usually normal. Family history of epilepsy is frequently present. Focal and generalised seizures may be present most frequently in isolation to mark the diagnostic category, and rarely in combination. The interictal and ictal EEG may show typical, sometimes pathognomonic, patterns. Neuroimaging is normal although focal abnormalities are occasionally reported.

8A61.30 Juvenile myoclonic epilepsy

Epilepsy with onset between the ages of 6 and 25 years with myoclonic jerks without loss of consciousness predominantly occurring early in the morning. Intelligence is not affected. Jerks may be facilitated by sleep deprivation, stress, or certain visual stimuli. Convulsive seizures may occur and may be preceded by myoclonic jerks.

8A61.31 Juvenile absence epilepsy

Juvenile absence epilepsy is one of the age-related idiopathic generalised epilepsies (IGE) with an age at onset between 10 and 17 years of age, and is characterised by sporadic (non-pyknoleptic) occurrence of absence seizures frequently associated with generalised tonic-clonic seizures (GTCS) predominantly on awakening. Interictal and ictal EEG shows generalised spike and wave discharges with normal background activity.

8A61.32 Benign adult familial myoclonus epilepsy

Benign adult familial myoclonic epilepsy (BAFME) is an inherited epileptic syndrome characterised by cortical hand tremors, myoclonic jerks and occasional generalised or focal seizures with a non-progressive or very slowly progressive disease course, and no signs of early dementia or cerebellar ataxia.

8A61.3Y Other specified genetic epileptic syndrome with adolescent or adult onset

8A61.3Z Genetic epileptic syndrome with adolescent or adult onset, unspecified

8A61.4 **Genetic epileptic syndromes with variable age of onset**

Epilepsies occurring in an otherwise normal child or adult. Seizures may occur spontaneously or may be provoked by external stimuli. Family history of seizures is not uncommon and is frequently reported in selected epilepsy syndromes.

Genetic aspects may follow differing features ranging from complex hereditary patterns to classic Mendelian features or to focused defects.

8A61.40 Reflex epilepsies

Reflex epilepsies are rare epileptic syndromes with seizures induced by specific triggering factors (either by visual, auditory, somato-sensitive or somato-motor stimulation, or by higher cortical function activities). Photosensitive epilepsies are the most frequent form. Spontaneous seizures may also occur. 'Reflex seizures'' can be classified into a simple 'pure'' reflex epilepsy and a complex group. The former comprises seizure triggered by simple sensory stimuli or by movements (photosensitive epilepsies). The latter are triggered by complex mental and emotional processes (verbal and non-verbal epilepsies).

8A61.41 Progressive myoclonic epilepsy

8A61.4Y Other specified genetic epileptic syndromes with variable age of onset

8A61.4Z Genetic epileptic syndromes with variable age of onset, unspecified

8A61.Y **Other specified genetic or presumed genetic syndromes primarily expressed as epilepsy**

8A61.Z **Genetic or presumed genetic syndromes primarily expressed as epilepsy, unspecified**

8A62 Epileptic encephalopathies

Epilepsies for which no clear etiology can be detected or occurring at the presence of two or more static structural or metabolic conditions increasing the risk for epileptic seizures. The epileptic activity itself may contribute to severe cognitive and behavioural impairments above and beyond what might be expected from the underlying pathology alone.

8A62.0 **Infantile spasms**

Syndrome characterised by the subacute onset of brief, repeated seizures with axial or limb flexion, occurring in clusters. EEG shows hypsarrhythmia, i.e., chaotic, high voltage slowing multifocal spikes, with ictal abrupt decremental pattern. Various structural brain pathologies may be present, or no cause may be found. Two-thirds of children have subsequent cognitive deficits.

8A62.1 **Lennox-Gastaut syndrome**

Syndrome defined as a cryptogenic or symptomatic generalised epilepsy, which is characterised by the following symptomatic triad: several epileptic seizures (atypical absences, axial tonic seizures and sudden atonic or myoclonic falls); diffuse slow interictal spike waves in the waking EEG (< 3 Hz) and fast rhythmic bursts (10 Hz) during sleep; slow mental development associated with personality disturbances.

8A62.2 **Acquired epileptic aphasia**

Epilepsy with onset in a previously normal child characterised by acquired aphasia, variable seizure types, focal bitemporal EEG epileptiform abnormalities (1.5-5Hz spike and slow-waves), frequently activated by sleep, with or without seizures. behavioural disorders such as hyperactivity and attention deficit are common. There is no documented brain pathology.

8A62.Y **Other specified epileptic encephalopathies**

8A62.Z **Epileptic encephalopathies, unspecified**

8A63 Seizure due to acute causes

A clinical seizure occurring at the time of a systemic insult or in close temporal association with a documented brain insult.

Coding Note: Code also the causing condition

Exclusions: Migraine aura-triggered seizures (8A80.3)

8A63.0 **Febrile seizures**

Seizures associated with a rise of the body temperature in the absence of intracranial infection, metabolic disturbance, or history of afebrile seizures. They most commonly occur in children between the ages of 6 months and 5 years.

8A63.00 Simple febrile seizures

Febrile seizures lasting less than 15 minutes, with no focal features and no occurrence in series.

8A63.01 Complex febrile seizures

Febrile seizures lasting longer than 15 minutes and/or multiple episodes occurring within 24 hours and/or seizures with focal features.

8A63.0Y Other specified febrile seizures

8A63.Y **Seizure due to other acute cause**

Coding Note: Code also the causing condition

8A63.Z **Seizure due to unspecified acute cause**

Coding Note: Code also the causing condition

8A64 **Single seizure due to remote causes**

An unprovoked seizure occurring in a patient with no history of antecedent seizures but with abnormalities of brain development or a potentially responsible clinical condition (metabolic, structural, toxic). The temporal relationship with the CNS insult is beyond the interval estimated for the occurrence of acute symptomatic seizures. The CNS insult may be static or progressive.

Coding Note: Code also the causing condition

8A65 **Single unprovoked seizure**

A seizure occurring in the absence of a potentially responsible structural or metabolic condition or beyond the interval estimated for the occurrence of an acute symptomatic seizure.

8A66 **Status epilepticus**

Status epilepticus is defined as 5 min or more of (i) continuous clinical and/or electrographic seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.

8A66.0 **Convulsive status epilepticus**

Convulsive status epilepticus is defined as 5 min or more of (i) continuous clinical convulsive seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.

8A66.1 **Non-convulsive status epilepticus**

Non- convulsive status epilepticus is defined as 5 min or more of (i) continuous clinical and/or electrographic seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.

8A66.10 Absence status epilepticus

An absence seizure (see absence seizures, typical and atypical) lasting >10 min (on average 10-15 min).

8A66.1Y Other specified non-convulsive status epilepticus

8A66.1Z Non-convulsive status epilepticus, unspecified

8A66.Y **Other specified status epilepticus**

8A66.Z **Status epilepticus, unspecified**

8A67 Acute repetitive seizures

Acute repetitive seizures are multiple seizures, with a distinct time of onset, with recovery between each seizure, occurring within 24 hours in adults, or 12 hours in children.

8A68 Types of seizures

Coding Note: Code also the causing condition

Exclusions: Dissociative neurological symptom disorder, with non-epileptic seizures (6B60.4)

Neonatal seizures (KB06)

8A68.0 **Focal unaware seizure**

Previously termed “complex partial seizures”, define seizures originating within networks limited to one hemisphere and accompanied by loss of awareness (i.e., knowledge of self or environment).

8A68.1 **Absence seizures, atypical**

Absence seizures with changes in tone more pronounced than in typical absences or with non-abrupt onset and/or cessation, often associated with slow, irregular, generalised spike-wave activity.

8A68.2 **Absence seizures, typical**

Seizures characterised by sudden onset, interruption of ongoing activities, blank stare, possibly brief upward gaze deviation, unresponsiveness, duration from few seconds to half a minute, and rapid recovery. An EEG would show generalised epileptiform discharges during the event.

8A68.3 **Focal aware seizure**

Focal aware seizures define seizures originating within networks limited to one hemisphere and accompanied by awareness (i.e., knowledge of self or environment).

8A68.4 **Generalised tonic-clonic seizure**

A seizure characterized by an abrupt onset with loss of consciousness and bilateral tonic extension of the trunk and limbs (tonic phase) followed by synchronous muscle jerking (clonic phase). Usually followed by a postictal phase, lasting for several minutes up to hours, characterized by initial mydriasis, body relaxation, hypotonia, and sleep.

8A68.5 **Generalised myoclonic seizure**

Seizure characterized by sudden, rapid brief (<100msec) involuntary muscle jerks that may involve just one muscle or the entire trunk musculature and are associated with an ictal EEG discharge. Can occur bilaterally, unilaterally, synchronously or asynchronously.

8A68.6 **Generalised tonic seizure**

A seizure characterised by sustained increase in muscle contraction lasting a few seconds to minutes.

8A68.7 **Generalised atonic seizure**

Seizure characterised by sudden loss or diminution of muscle tone without apparent preceding myoclonic or tonic event lasting 1-2 sec, involving head, trunk, jaw, or limb muscles.

8A68.Y **Other specified type of seizure**

Coding Note: Code also the causing condition

8A68.Z **Type of seizure, unspecified**

Coding Note: Code also the causing condition

8A6Y **Other specified epilepsy or seizures**

Coding Note: Use additional code, if desired, to identify the type of seizure.

8A6Z **Epilepsy or seizures, unspecified**

Coding Note: Use additional code, if desired, to identify the type of seizure.

Headache disorders (8A80-8A8Z)

Exclusions: Headache, not elsewhere classified (MB4D)

8A80 **Migraine**

A primary headache disorder, in most cases episodic. Disabling attacks lasting 4-72 hours are characterised by moderate or severe headache, usually accompanied by nausea, vomiting and/or photophobia and phonophobia, and sometimes preceded by a short-lasting aura of unilateral fully-reversible visual, sensory or other central nervous system symptoms. In a small minority of cases headache, but not necessarily the associated symptoms, becomes very frequent, with loss of episodicity.

Exclusions: Headache, not elsewhere classified (MB4D)

8A80.0 **Migraine without aura**

Recurrent headache disorder manifesting in attacks lasting 4-72 hours. The duration of attacks may be shorter in children. Typical characteristics of the headache are unilateral location, pulsating quality, moderate or severe intensity, aggravation by routine physical activity and association with nausea and/or photophobia and phonophobia.

8A80.1 **Migraine with aura**

Recurrent attacks, lasting minutes, of unilateral fully-reversible visual, sensory or other central nervous system symptoms that usually develop gradually and are usually followed by headache and associated migraine symptoms.

8A80.10 Hemiplegic migraine

Migraine with aura including motor weakness.

8A80.1Y Other specified migraine with aura

8A80.1Z Migraine with aura, unspecified

8A80.2 **Chronic migraine**

Headache occurring on 15 or more days per month for more than three months, which, on at least 8 days per month, has the features of migraine headache and is not associated with medication overuse.

8A80.3 **Complications related to migraine**

8A80.30 Status migrainosus

A debilitating migraine attack lasting for more than 72 hours

8A80.3Y Other specified complications related to migraine

8A80.4 **Cyclic vomiting syndrome**

Recurrent episodic attacks, usually stereotypical in the individual patient, of vomiting and intense nausea. Attacks are associated with pallor and lethargy. There is complete resolution of symptoms between attacks.

8A80.Y **Other specified migraine**

8A80.Z **Migraine, unspecified**

8A81 Tension-type headache

A primary and highly prevalent headache disorder, in most cases episodic. Attacks of highly variable frequency and duration are characterised by mild-to-moderate headache without associated symptoms, although pericranial tenderness may be present. In a minority of cases the disorder evolves, with increasingly frequent headache and sometimes loss of episodicity.

Exclusions: New daily-persistent headache (8A83)

8A81.0 **Infrequent episodic tension-type headache**

Infrequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.

8A81.1 **Frequent episodic tension-type headache**

Frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.

8A81.2 **Chronic tension-type headache**

A disorder evolving from frequent episodic tension-type headache, with daily or very frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting hours to days, or unremitting. The pain does not worsen with routine physical activity, but may be associated with mild nausea, photophobia or phonophobia.

8A81.Y **Other specified tension-type headache**

8A81.Z **Tension-type headache, unspecified**

8A82 Trigeminal autonomic cephalalgias

A group of related primary headache disorders essentially characterised by unilateral headache and trigeminal autonomic activation. In most but not all of these disorders, the headache is short-lasting and very frequently recurring, but sometimes remitting for long periods.

8A83 Other primary headache disorder

A group of clinically heterogeneous headache disorders, believed to be primary. Although largely unrelated, they fall into four categories: headaches associated with physical exertion; headaches attributed to direct physical but innocuous stimuli; epicranial headaches; and other miscellaneous primary headache disorders.

8A84 Secondary headache

Coding Note: Code also the causing condition

8A84.0 **Acute headache associated with traumatic injury to the head**

Headache of less than three months' duration associated with traumatic injury to the head.

8A84.1 **Persistent headache associated with traumatic injury to the head**

Headache of greater than three months' duration caused by traumatic injury to the head.

8A84.Y **Other specified secondary headache**

Coding Note: Code also the causing condition

8A84.Z **Secondary headache, unspecified**

8A85 Painful cranial neuropathies or other facial pains

A group of disorders characterised by head and/or facial pain, presenting variably as a neuralgia or as pain of neuropathic or central origin.

Coded Elsewhere: Trigeminal neuralgia (8B82.0)

Burning mouth syndrome (DA0F.0)

8A8Y Other specified headache disorders

8A8Z Headache disorders, unspecified

Cerebrovascular diseases (8B00-8B2Z)

This is a group of brain dysfunctions related to disease of the blood vessels supplying the brain. This includes “stroke”, which includes the following entities - . Intracerebral haemorrhage; Subarachnoid haemorrhage; cerebral ischemic stroke, and Stroke not known if ischaemic or haemorrhagic.

Inclusions: Cerebrovascular disease with mention of hypertension

Exclusions: Intracranial injury (NA07)

Coded Elsewhere: Asymptomatic stenosis of intracranial or extracranial artery (BD55)

Asymptomatic occlusion of intracranial or extracranial artery (BD56)

Intracranial haemorrhage (8B00-8B0Z)

Coded Elsewhere: Intracranial nontraumatic haemorrhage of fetus or newborn (KA82)

8B00 **Intracerebral haemorrhage**

Acute neurological dysfunction caused by haemorrhage within the brain parenchyma or in the ventricular system.

Coding Note: Code also the causing condition

Exclusions: sequelae of intracerebral haemorrhage (8B25.1)

Traumatic intracerebral haemorrhage (NA07.1)

Coded Elsewhere: Intracerebral nontraumatic haemorrhage of fetus or newborn (KA82.4)

8B00.0 Deep hemispheric haemorrhage

Acute neurological dysfunction caused by haemorrhage localised to the subcortex, basal ganglia, and the diencephalon (thalamus).

Coding Note: Code also the causing condition

Inclusions: Deep intracerebral haemorrhage

8B00.1 Lobar haemorrhage

Acute neurological dysfunction caused by haemorrhage within the lobes of the brain and outside the subcortex, basal ganglia, and the diencephalon (thalamus).

Coding Note: Code also the causing condition

Inclusions: Cerebral lobe haemorrhage

Superficial intracerebral haemorrhage

8B00.2 Brainstem haemorrhage

Coding Note: Code also the causing condition

8B00.3 Cerebellar haemorrhage

Coding Note: Code also the causing condition

Coded Elsewhere: Cerebellar nontraumatic, hemispheres or vermis or posterior fossa haemorrhage of fetus or newborn (KA82.6)

8B00.4 **Intraventricular haemorrhage without parenchymal haemorrhage**

Acute neurological dysfunction caused by haemorrhage within the ventricular system, without a component of parenchymal haemorrhage.

Coding Note: Code also the causing condition

8B00.5 **Haemorrhage of multiple sites**

Acute neurological dysfunction caused by haemorrhage of multiple sites, within the brain parenchyma, or in the ventricular system combined with haemorrhage in the brain parenchyma.

Coding Note: Code also the causing condition

8B00.Z **Intracerebral haemorrhage, site unspecified**

Coding Note: Code also the causing condition

8B01 Subarachnoid haemorrhage

Acute neurological dysfunction caused by subarachnoid haemorrhage.

Exclusions: sequelae of subarachnoid haemorrhage (8B25.2)

Traumatic subarachnoid haemorrhage (NA07.7)

Coded Elsewhere: Subarachnoid nontraumatic haemorrhage of fetus or newborn (KA82.5)

8B01.0 **Aneurysmal subarachnoid haemorrhage**

Inclusions: ruptured cerebral aneurysm NOS

8B01.1 **Non-aneurysmal subarachnoid haemorrhage**

8B01.2 **Subarachnoid haemorrhage not known if aneurysmal or non-aneurysmal**

8B02 Nontraumatic subdural haemorrhage

Coding Note: This entity is not part of the definition of stroke.

Exclusions: Traumatic subdural haemorrhage (NA07.6)

Coded Elsewhere: Subdural nontraumatic haemorrhage of fetus or newborn (KA82.7)

8B03 Nontraumatic epidural haemorrhage

Coding Note: This entity is not part of the definition of stroke.

8B0Z Intracranial haemorrhage, unspecified

Coded Elsewhere: Neonatal cerebral ischaemia (KB00)

8B10 **Transient ischaemic attack**

Transient episode of focal neurological dysfunction caused by focal brain ischemia without acute infarction in the clinically relevant area of the brain or transient monocular visual loss due to retinal ischemia. Symptoms should resolve completely within 24 hours.

Exclusions: Neonatal cerebral ischaemia (KB00)

Transient global amnesia (MB21.12)

8B10.0 Amaurosis fugax

A transient episode of acute visual dysfunction caused by retinal ischaemia. Symptoms should resolve completely within 24 hours.

Coding Note: Code also the causing condition

8B10.Y Other specified transient ischaemic attack

8B10.Z Transient ischaemic attack, unspecified

8B11 **Cerebral ischaemic stroke**

Acute focal neurological dysfunction caused by focal infarction at single or multiple sites of the brain. Evidence of acute infarction may come either from a) symptom duration lasting more than 24 hours, or b) neuroimaging or other technique in the clinically relevant area of the brain. The term does not include infarction of the retina.

Coding Note: When the cause of ischaemic stroke is known, code to the cause. When the cause of ischaemic stroke is not known, code to 8B11.5-. When the cause of stroke is not known, code to 8B20 Stroke not known if ischaemic or haemorrhagic.

Exclusions: sequelae of cerebral infarction (8B25.0)

Silent cerebral infarct (8B21.0)

8B11.0 Cerebral ischaemic stroke due to extracranial large artery atherosclerosis

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.1 Cerebral ischaemic stroke due to intracranial large artery atherosclerosis

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.2 Cerebral ischaemic stroke due to embolic occlusion

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.20 Cerebral ischaemic stroke due to cardiac embolism

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.21 Cerebral ischaemic stroke due to aortic arch embolism

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.22 Cerebral ischaemic stroke due to paradoxical embolism

This is a sudden loss of brain function due to a lack of adequate blood flow. It is the result of a thromboembolism – a blood clot that detached and travelled through the blood vessels – that originated in the venous system. Because of a heart defect, it passes through to the systemic circulation system, instead of becoming lodged in the lungs.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.2Y Cerebral ischaemic stroke due to other specified embolic occlusion

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.2Z Cerebral ischaemic stroke due to embolic occlusion, unspecified

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.3 **Cerebral ischaemic stroke due to small artery occlusion**

This is a sudden loss of brain function due to a lack of adequate blood flow of the small arteries.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.4 **Cerebral ischaemic stroke due to other known cause**

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.40 Cerebral ischaemic stroke due to global hypoperfusion with watershed infarct

This is a sudden loss of brain function due to a lack of adequate blood flow. It occurs in association with a low state of blood flow to the brain. The "watershed" regions of the brain, regions that are supplied by the branching ends of two large arteries, are particularly sensitive to low oxygen supply when arteries do not maintain the appropriate tension.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.41 Cerebral ischaemic stroke due to other non-atherosclerotic arteriopathy

This is a sudden loss of brain function due to a lack of adequate blood flow. It is due to a disorder of the arteries, but it is neither associated with atherosclerosis nor classified elsewhere.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.42 Cerebral ischaemic stroke due to hypercoagulable state

This is a sudden loss of brain function due to a lack of adequate blood flow. It is associated with a blood clot and a risk factor that increases blood clotting.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.43 Cerebral ischaemic stroke in association with subarachnoid haemorrhage

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.44 Cerebral ischemic stroke from dissection

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B11.5 **Cerebral ischaemic stroke of unknown cause**

This is a sudden loss of brain function due to a lack of adequate blood flow. It is of an uncertain nature, and approximately 30% of examined events fall into this category.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

Inclusions: cryptogenic stroke

8B11.50 Cerebral ischaemic stroke due to unspecified occlusion or stenosis of extracranial large artery

This is a sudden loss of brain function due to a lack of adequate blood flow of the large extracranial arteries.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

Exclusions: Cerebral ischaemic stroke due to embolic occlusion (8B11.2)

Cerebral ischaemic stroke due to other known cause (8B11.4)

Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)

8B11.51 Cerebral ischaemic stroke due to unspecified occlusion or stenosis of intracranial large artery

This is a sudden loss of brain function due to a lack of adequate blood flow of the large intracranial arteries.

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

Exclusions: Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1)

Cerebral ischaemic stroke due to embolic occlusion (8B11.2)

Cerebral ischaemic stroke due to other known cause (8B11.4)

8B11.5Z Cerebral ischaemic stroke, unspecified

Coding Note: If an additional code is used for anatomy, the artery affected by the stroke should be selected.

8B1Y **Other specified cerebral ischaemia**

8B1Z **Cerebral ischaemia, unspecified**

8B20 **Stroke not known if ischaemic or haemorrhagic**

Fulfills criteria for stroke in that acute symptoms of focal brain injury that have lasted 24 hours or more (or led to death before 24 hours), but subtype of stroke (ischemic or haemorrhagic) has not been determined by neuroimaging or other techniques.

Exclusions: sequelae of stroke (8B25.4)

8B21 **Cerebrovascular disease with no acute cerebral symptom**

Silent" cerebral infarct is defined as an infarct demonstrated on neuroimaging or at autopsy that has not caused acute dysfunction of the brain (I e does not qualify for diagnoses of TIA or cerebral ischemic stroke). The term "silent" denotes lack of acute symptoms.

Exclusions: Transient ischaemic attack (8B10)

Cerebral ischaemic stroke (8B11)

Intracerebral haemorrhage (8B00)

Subarachnoid haemorrhage (8B01)

Stroke not known if ischaemic or haemorrhagic (8B20)

8B21.0 Silent cerebral infarct

Cerebral infarct that has not caused acute focal dysfunction of the brain.

8B21.1 Silent cerebral microbleed

Small bleeding in the brain parenchyma that has not caused acute focal dysfunction of the brain.

8B21.Y Other specified cerebrovascular disease with no acute cerebral symptom

8B21.Z Cerebrovascular disease with no acute cerebral symptom, unspecified

8B22 **Certain specified cerebrovascular diseases**

Specified other abnormalities of intracranial or extracranial arteries or veins. Entities in this section may be used in combination with other diagnostic codes in this block. Several of the entities may each cause different types of cerebrovascular disease such as TIA, cerebral ischemic stroke or intracerebral haemorrhage; may be associated with other clinical syndromes; or may be asymptomatic (not having caused acute focal dysfunction of the brain).

Section on Intracranial vascular malformations have been much revised compared to ICD-10 based on major scientific progress in this field.

Cerebral vasoconstriction syndromes and Posterior reversible encephalopathy are considered to be separate entities (as vasoconstriction is not always present in the latter).

"Progressive vascular leukoencephalopathy (Binswanger's disease)" has been removed as a separate entity.

Exclusions: Late effects of cerebrovascular disease (8B25)

8B22.0 **Dissection of cerebral arteries**

Exclusions: ruptured cerebral arteries (8B01)

8B22.1 **Cerebral venous thrombosis**

Thrombosis (blood clot) of the cerebral venous sinuses, which drain blood from brain

Exclusions: Cerebral ischaemic stroke (8B11)

Cerebral venous thrombosis in the puerperium (JB41.3)

Coded Elsewhere: Cerebral venous thrombosis in pregnancy (JA61.5)

Neonatal cerebral sinovenous thrombosis (KB00.1)

8B22.2 **Cerebral vasoconstriction syndromes**

Cerebral vasoconstriction syndrome is characterised by severe headaches, with or without other acute neurological symptoms, and diffuse segmental constriction of cerebral arteries

8B22.3 **Isolated cerebral amyloid angiopathy**

Cerebral amyloid angiopathy is characterised by the progressive accumulation of amyloid protein in the walls of small-to-medium-sized arteries and arterioles predominantly located in the leptomeningeal space, the cortex, and, to a lesser extent, also in the capillaries and veins.

8B22.4 **Intracranial vascular malformation**

8B22.40 Arteriovenous malformation of cerebral vessels

8B22.41 Cerebral cavernous malformation

Cerebral cavernomas, still called cavernous angiomas, angioma cavernosum or cavernous hemangiomas, are vascular malformations in the brain that are asymptomatic or lead to seizures and/or cerebral haemorrhages. These are often found in an inheritable disorder with autosomal dominant inheritance.

8B22.42 Dural arteriovenous fistula

Dural arteriovenous fistulas are formed by an abnormal connection between arteries within the dura mater and veins that normally drain the brain.

8B22.43 Carotid cavernous fistula

A carotid-cavernous fistula results from an abnormal communication between the arterial and venous systems within the cavernous sinus in the skull.

8B22.4Y Other specified intracranial vascular malformation

8B22.4Z Intracranial vascular malformation, unspecified

8B22.5 **Cerebral aneurysm, nonruptured**

Exclusions: Congenital cerebral nonruptured aneurysm (LA90.42)

ruptured cerebral aneurysm (8B01.0)

8B22.6 **Familial cerebral saccular aneurysm**

These are pouch-like expansions of arteries inside the skull that are familial.

8B22.7 **Cerebral arteritis, not elsewhere classified**

8B22.70 Primary cerebral arteritis

Primary cerebral arteritis (or "angiitis") results from inflammation and destruction of central nervous system (CNS) vessels without evidence of vasculitis outside the CNS

8B22.7Y Other specified cerebral arteritis, not elsewhere classified

8B22.7Z Cerebral arteritis, not elsewhere classified, unspecified

8B22.8 **Hypertensive encephalopathy**

8B22.9 **Migraine-induced stroke**

8B22.A **Subclavian steal syndrome**

Retrograde blood flow in the vertebral artery in the setting of ipsilateral proximal subclavian artery stenosis or occlusion leading to symptoms of basilar insufficiency.

8B22.B **Moyamoya syndrome**

A cerebrovascular disease caused by stenotic arteries at the base of the brain in the basal ganglia. Moyamoya, meaning "puff of smoke" refers to the appearance of the anastomotic vessel network formed at the base of the brain distal to the circle of Willis to compensate for the blockage.

8B22.C **Hereditary cerebrovascular diseases**

Hereditary cerebrovascular disease does not include effects from abnormalities due other vascular diseases which are independent of the nervous system.

8B22.C0 CADASIL - [cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy] syndrome

CADASIL is the acronym for Cerebral Autosomal Dominant Arteriopathy with Subcortical Infarcts and Leukoencephalopathy. CADASIL is a genetic disease transmitted in an autosomal dominant pattern. It is associated with ischemic stroke, migraine, dementia, psychological disturbances.

8B22.C1 CARASIL - [cerebral autosomal recessive arteriopathy with subcortical infarcts and leukoencephalopathy] syndrome

CARASIL is the acronym for cerebral autosomal recessive arteriopathy with subcortical ischaemic strokes and leukoencephalopathy.

8B22.CY Other specified hereditary cerebrovascular diseases

8B22.CZ Hereditary cerebrovascular diseases, unspecified

8B22.Y **Other specified cerebrovascular disease**

8B23 Cerebrovascular abnormalities

Cerebrovascular abnormalities in diseases that also involve other parts of the vascular system than intracranial and extracranial arteries, or other body systems than the nervous system.

Coding Note: Code also the causing condition

Coded Elsewhere: Vein of Galen aneurysm (LA90.20)

Cerebral arteritis in infectious or parasitic diseases (8B22.7Y)

8B24 Hypoxic-ischaemic encephalopathy

Brain damage due to hypoxia-ischemia: Previous term Anoxic brain damage has been changed. The new term is now widely accepted, and better describes the pathophysiology, i.e., the combination of complete and incomplete transitory global cerebral ischemia together with a combination of anoxia and hypoxia. In a surviving patient, pure anoxic encephalopathy is very uncommon.

Exclusions: complicating: surgical and medical care (NE80-NE8Z)

neonatal anoxia (KB21)

Central nervous system complications of anaesthesia during pregnancy (JA67.2)

complicating: abortion or ectopic or molar pregnancy (JA00-JA0Z)

Central nervous system complications of anaesthesia during labour or delivery (JB0C.3)

Central nervous system complications of anaesthesia during the puerperium (JB43.2)

Coded Elsewhere: Hypoxic ischaemic encephalopathy of newborn (KB04)

8B24.0 Anoxic-ischaemic encephalopathy

8B24.Y Other specified hypoxic-ischaemic encephalopathy

8B24.Z Hypoxic-ischaemic encephalopathy, unspecified

8B25 Late effects of cerebrovascular disease

Effects of cerebrovascular disease 1 month or later after the onset of the disease. Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.0 **Late effects of cerebral ischemic stroke**

Late effects of cerebral ischaemic stroke 1 month or later after the onset of the disease. Codes for the acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.1 **Late effects of intracerebral haemorrhage**

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.2 **Late effects of subarachnoid haemorrhage**

Late effects of non-traumatic subarachnoid haemorrhage 1 month or later after the onset of the disease. Codes for acute haemorrhage should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.

Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.3 **Late effects of other nontraumatic intracranial haemorrhage**

Late effects of other non-traumatic intracranial haemorrhage 1 month or later after the onset of the disease. Codes for acute episode should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.

Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.4 **Late effects of stroke not known if ischaemic or haemorrhagic**

Late effects occurring 1 month or later after the onset of the disease. Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.

Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.Y **Late effects of other specified cerebrovascular disease**

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B25.Z **Late effects of cerebrovascular disease, unspecified**

Coding Note: Use of the code ”Late effects of cerebrovascular disease” requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

8B26 Vascular syndromes of brain in cerebrovascular diseases

Coding Note: Code also the causing condition

8B26.0 **Brainstem stroke syndrome**

Coding Note: Code also the causing condition

8B26.1 **Cerebellar stroke syndrome**

Coding Note: Code also the causing condition

8B26.2 **Middle cerebral artery syndrome**

Coding Note: Code also the causing condition

8B26.3 **Anterior cerebral artery syndrome**

Coding Note: Code also the causing condition

8B26.4 **Posterior cerebral artery syndrome**

Coding Note: Code also the causing condition

8B26.5 **Lacunar syndromes**

Coding Note: Code also the causing condition

8B26.50 Pure motor lacunar syndrome

8B26.51 Pure sensory lacunar syndrome

8B26.5Y Other specified lacunar syndromes

Coding Note: Code also the causing condition

8B26.5Z Lacunar syndromes, unspecified

Coding Note: Code also the causing condition

8B26.Y **Other specified vascular syndromes of brain in cerebrovascular diseases**

Coding Note: Code also the causing condition

8B26.Z **Vascular syndromes of brain in cerebrovascular diseases, unspecified**

Coding Note: Code also the causing condition

8B2Z **Cerebrovascular diseases, unspecified**

Spinal cord disorders excluding trauma (8B40-8B4Z)

Coded Elsewhere: Dural arteriovenous fistula (8B22.42)

Intervertebral disc degeneration (FA80)

8B40 **Cauda equina syndrome**

8B41 **Myelitis**

Coding Note: Code also the causing condition

8B42 **Myelopathy**

Coding Note: Code also the causing condition

Coded Elsewhere: Myelopathy due to nutritional deficiency (8D40.Y)

8B43 **Non-compressive vascular myelopathies**

Non-compressive spinal cord syndromes due to arterial or venous circulation anomalies.

8B43.0 **Acute arterial infarction of the spinal cord**

Acute arterial infarction of the spinal cord is due to occlusion of the anterior or posterior spinal arteries or their branches. Classical anterior spinal artery occlusion in the watershed zone in the lower cervical cord causes a specific cord syndrome with sparing of the posterior segment of the cord. Associated aortic atherosclerotic disease as well as dissection should not be overlooked.

8B43.1 **Acute venous infarction of the spinal cord**

Loss of blood flow in the venous system, leading to spinal cord infarction, commonly associated with dural fistula and dural arteriovenous malformation.

8B43.2 **Chronic venous infarction of the spinal cord**

Loss of blood flow to the spinal cord due to venous flow abnormality, leading to spinal cord infarction development over a longer period of time.

8B43.Y **Other specified non-compressive vascular myelopathies**

8B43.Z **Non-compressive vascular myelopathies, unspecified**

8B44 Degenerative myelopathic disorders

Coded Elsewhere: Friedreich ataxia (8A03.10)

Primary lateral sclerosis (8B60.4)

8B44.0 **Hereditary spastic paraplegia**

Hereditary spastic paraplegias (HSP) comprise a genetically and clinically heterogeneous group of neurodegenerative disorders characterised by varying degrees of lower limb spasticity, pyramidal weakness, hyperreflexia and hypertonic bladder involvement. Clinically, HSPs can be divided into two main groups: uncomplicated (pure) and complicated (complex) forms depending on the presence of other neurological features including ataxia, peripheral neuropathy, cognitive impairment, epilepsy, amyotrophy, retinopathy, deafness, ichthyosis and extrapyramidal involvement, in addition to spastic paraparesis. Pure HSPs are characterised by slowly progressive lower extremity spasticity and weakness, often associated with hypertonic urinary disturbances, mild reduction of lower extremity vibration sense and, occasionally, of joint position sensation. Complex HSP forms are characterised by the presence of additional neurological or non-neurological features. A positive family history particularly in autosomal dominant cases is often but not always present. The diagnosis may be aided by neuroimaging and genetic testing.

Coded Elsewhere: Spastic paraplegia - nephritis - deafness (LD2H.Y)

8B44.00 Autosomal dominant hereditary spastic paraplegia

8B44.01 Autosomal recessive hereditary spastic paraplegia

8B4Y Other specified spinal cord disorders excluding trauma

8B4Z Spinal cord disorders excluding trauma, unspecified

Motor neuron diseases or related disorders (8B60-8B6Z)

A group of genetic disorders characterised by progressive weakness secondary to degeneration of the lower motor neurons

8B60 Motor neuron disease

Motor neuron disease is a neurodegenerative disorder of undetermined etiology, characterised by degeneration of upper motor neurons (cortical Betz cells and corticospinal tract) or lower motor neurons (ventral horns of spinal cord and cranial nerve motor nuclei) or both. Features of involvement of lower motor neurons (LMN) are atrophy, weakness, fasciculations, hypotonia, decreased or absent deep tendon reflexes. Features of involvement of upper motor neurons (UMN) are spasticity, exaggerated deep tendon reflexes, and extensor plantar responses. Depending on the site of onset and the presence of UMN or LMN features or both, MND has varying patterns and distributions of signs and symptoms.

Coded Elsewhere: Brown-Vialetto-van Laere syndrome (LD2H.Y)

8B60.0 Amyotrophic lateral sclerosis

Amyotrophic lateral sclerosis (ALS) is a progressive, fatal disorder in which progressive signs of LMN and UMN degeneration are seen within one or more of the four regions: bulbar, cervical, thoracic and lumbosacral. Electrophysiological studies may be required to confirm lower motor neuron degeneration and to exclude alternative causes. Neuroimaging may be performed to exclude other causes, which might explain the clinical and electrophysiological features. Familial ALS (FALS) of autosomal dominant inheritance, constitutes 5 to 10% of ALS. The clinical profile of FALS and sporadic ALS is similar. Mutations in the C9ORF72 and Cu/Zn superoxide dismutase (SOD1) genes constitute 50-60% of FALS.

8B60.1 Progressive bulbar palsy

Progressive bulbar palsy (PBP) is a variant of amyotrophic lateral sclerosis that initially presents with symptoms of bulbar weakness such as dysarthria and dysphagia. Symptoms may remain relatively confined to the bulbar region. PBP more commonly affects females than males. Patients typically progress to develop limb weakness and features consistent with more typical ALS at a later stage of disease.

8B60.2 Progressive pseudobulbar palsy

Spastic speech, difficulty in swallowing, emotional lability, brisk jaw jerk, release reflexes such as palmomental reflex due to involvement of craniobulbar tracts are the common features of progressive pseudobulbar palsy. Usually mild lower motor neuron signs observed in progressive bulbar palsy may also co-exist or may develop during the progression of the disorder.

8B60.3 Progressive muscular atrophy

In progressive muscular atrophy, lower motor neuron signs in limb and trunk muscles are present without upper motor neuron involvement. Over time, some patients may progress to develop upper motor neuron signs, of which pathological evidence is common even in patients who never displayed clinical upper motor neuron signs, suggesting that progressive muscular atrophy is a form of ALS.

Exclusions: Fazio-Londe syndrome (8B60)

Amyotrophic lateral sclerosis (8B60.0)

8B60.4 Primary lateral sclerosis

Primary lateral sclerosis (PLS) is a rare motor neuron disease variant which presents with slowly progressive UMN signs, such as spastic gait, brisk deep tendon jerks, and extensor plantar responses. Onset is most commonly with spastic paraparesis, but patients typically progress to develop upper limb and bulbar involvement. The characteristic feature of PLS is the complete absence of involvement of lower motor neuron involvement. When LMN signs develop during the course of the disease, the diagnosis will change to ALS, and they are considered a spectrum of the same disorder.

8B60.5 Amyotrophic lateral sclerosis-Plus

This category represents a group of disorders with motor symptoms of ALS and superimposed features of dysfunction of other neurological systems, such as extrapyramidal, cerebellar or cognitive dysfunction.

8B60.6 Monomelic amyotrophy

Atrophy and weakness restricted to one upper or lower limb, onset in the second or third decade, male predominance, and sporadic occurrence are characteristic features of MMA. Other typical features include: insidious onset of lower motor neuron signs due to anterior horn cell involvement, absence of upper motor neuron signs, slow progression followed by stabilization within a few years,, and a benign symptomatic disease course. MMA is particularly prevalent in Asia although is encountered worldwide.

8B60.7 Madras type motor neuron disease

8B60.Y Other specified motor neuron disease

8B60.Z Motor neuron disease, unspecified

8B61 Spinal muscular atrophy

Spinal muscular atrophy (SMA) is a progressive disorder with loss of anterior horn cells leading to muscle weakness and wasting. The weakness is typically symmetrical. Typically, upper motor neuron signs are absent and there is no sensory deficit. Feeding and swallowing can be affected, and involvement of respiratory muscles may occur. SMA is an autosomal recessive disorder linked to chromosome 5q13 and the disorder is caused by deletion or mutation of SMN 1 (spinal motor neuron 1) gene. The four types of SMA I, II, III and IV are categorised based on the age of onset of the disease and the ability to achieve motor milestones.

8B61.0 Infantile spinal muscular atrophy, Type I

In SMA type 1, onset of weakness may be prenatal (decreased fetal movements toward the end of pregnancy) or within the first six months of life. Infants demonstrate a characteristic frog position with the thighs externally rotated and abducted and knees the flexed (floppy infant). Bulbar weakness causes feeding difficulty. Children are never able to sit without support, and the average survival is 9 months; survival beyond 2 years is rare.

8B61.1 Late infantile spinal muscular atrophy, Type II

In SMA type 2, muscle weakness is seen between the ages of 6 to 18 months. The child can sit unsupported, but cannot stand or walk independently. Death usually occurs between 2 years of age and young adulthood.

8B61.2 Juvenile form spinal muscular dystrophy, Type III

In SMA type 3, weakness of muscles is seen after 18 months of age. The child is able to sit and stand independently. There is a limb girdle-type of distribution of weakness causing waddling gait, falls, and difficulty with running. The ability to walk may be lost, requiring a wheelchair as the disease progresses. The life expectancy may be normal.

8B61.3 Adult onset spinal muscular atrophy, Type IV

In SMA type 4 weakness, most commonly develops after 35 years of age (less commonly between 18 to 35 years old). Weakness of proximal muscles is more prominent in the legs than in the arms. Insidious onset and very slow progression are the characteristic features, and life span is normal.

8B61.4 Localised spinal muscular atrophy

This category comprises a group of disorders with a varied pattern of weakness and autosomal dominant or X-linked recessive inheritance with specific genetic profiles.

8B61.Y Other specified spinal muscular atrophy

8B61.Z Spinal muscular atrophy, unspecified

8B62 Post polio progressive muscular atrophy

The diagnostic criteria for Post-polio progressive muscular atrophy (PPMA) are: a credible history of poliomyelitis with partial recovery of function, a minimum 10-year period of stabilization, and the subsequent development of progressive muscle weakness. Symptoms of weakness, atrophy, and fatigue of previously affected muscles may be seen. These symptoms may also be newly noted in muscles that were apparently unaffected by the poliomyelitis episode. Muscle cramps and fasciculations may accompany the new weakness.

Inclusions: Post polio myelitic syndrome

8B6Y Other specified motor neuron diseases or related disorders

8B6Z Motor neuron diseases or related disorders, unspecified

8B81.Y Other specified disorders of vestibulocochlear nerve

8B81.Z Disorders of vestibulocochlear nerve, unspecified

8B82 Disorders of trigeminal nerve

The trigeminal nerve is a mixed nerve with three divisions, ophthalmic, maxillary and mandibular divisions, that provides sensory innervation to the face and mucous membrane of the oral and nasal cavities and motor innervations to the muscle of mastication, tensor tympani, tensor veli palatine, mylohyoid and anterior belly of the digastric muscle. The trigeminal nuclear complex extends throughout the brainstem, hence it is susceptible to many pathologic processes including demyelination, ischemia, haemorrhage, infectious and non-infectious inflammation and neoplasm leading to symptoms of trigeminal nerve involvement. Compression of the sensory nerve root outside the brain stem by a vascular loop leads to trigeminal neuralgia. Symptoms and signs depend on the site of the lesion. In general, a trigeminal nerve disorder is associated with hemisensory facial loss, deviation of the jaw to paralysed side on opening of the mouth, and loss of the corneal reflex.

Coded Elsewhere: Atypical facial pain (8A85)

8B82.0 Trigeminal neuralgia

Trigeminal neuralgia is a manifestation of orofacial neuropathic pain restricted to one or more divisions of the trigeminal nerve. The pain is recurrent, abrupt in onset and termination, triggered by innocuous stimuli and typically compared to an electric shock or described as shooting or stabbing. Some patients experience continuous pain between these painful paroxysms.

8B82.Z Disorders of trigeminal nerve, unspecified

8B83 Disorders of spinal accessory nerve

Coded Elsewhere: Injury of accessory nerve (NA04.A)

Lesion in jugular foramen (8B87)

8B84 Disorders of hypoglossal nerve

8B85 Disorders of multiple cranial nerves

This is a group of disorders of multiple cranial nerves, the twelve nerves that emerge from the brain and brainstem.

Inclusions: Cranial polyneuritis

8B86 Disorders of vagus nerve

Exclusions: Paralysis of vocal cords or larynx (CA0H.0)

Coded Elsewhere: Lesion in jugular foramen (8B87)

8B8Z **Disorders of cranial nerves, unspecified**

Nerve root or plexus disorders (8B90-8B9Z)

Exclusions: intervertebral disc disorders (FA80-FA8Z)

Spondylolysis (FA81)

8B90 **Nerve root and plexus compressions**

Coding Note: Code also the causing condition

8B91 **Brachial plexus disorders**

8B91.0 **Neuralgic shoulder amyotrophy**

Parsonage-Turner syndrome is a rare condition of unknown etiology that presents with a characteristic pattern of sudden and acute pain across the top of the shoulder, lasting a few hours to a fortnight, followed by flaccid paralysis of some muscles of the shoulder girdle.

8B91.1 **Thoracic outlet syndrome due to cervical rib**

8B91.Y **Other specified brachial plexus disorders**

8B91.Z **Brachial plexus disorders, unspecified**

8B92 **Lumbosacral plexus disorders**

8B92.0 **Post radiation lumbosacral plexopathy**

8B92.1 **Vasculitic lumbosacral plexopathy**

8B92.2 **Diabetic lumbosacral plexopathy**

Coding Note: Always assign an additional code for diabetes mellitus

8B92.3 **Lumbosacral radiculoplexopathy**

8B92.Y **Other specified lumbosacral plexus disorders**

8B92.Z **Lumbosacral plexus disorders, unspecified**

8B93 **Radiculopathy**

Exclusions: Neuritis (FB56)

Intervertebral disc degeneration (FA80)

8B93.0 Radiculopathy due to compression

8B93.1 Radiculopathy due to metabolic disorders

8B93.2 Radiculopathy due to electric shock or lightning

8B93.3 Radiculopathy due to radiation injury

8B93.4 Radiculopathy due to nutritional deficiencies

8B93.5 Radiculopathy due to toxicity

8B93.6 Radiculopathy due to intervertebral disc disorders

8B93.7 Radiculopathy due to neoplastic disease

8B93.8 Radiculopathy due to spondylosis

8B93.Y Other specified radiculopathy

8B93.Z Radiculopathy, unspecified

8B94 **Diabetic radiculoplexoneuropathy**

Diabetic radiculoplexoneuropathy is a rare, but established complication of a focal neuropathy occurring in patients with diabetes type 2. Etiologically inflammatory changes of microvasculitis are assumed. It is independent on the stage of diabetes and often occurs usually in association of weight loss, not before the 4th or 5th decade. It presents with acute severe pain, and predominant motor involvement of the lumbar plexus often asymmetric and usually unilateral. Muscle atrophy occurs early. It is self limiting, but disability may persist.

Always assign an additional code for the type of diabetes mellitus.

Coding Note: Code also the causing condition

8B95 **Secondary brachial plexus lesion due to certain specified disorders**

Coding Note: Code also the causing condition

8B9Y **Other specified nerve root or plexus disorders**

8B9Z **Nerve root or plexus disorders, unspecified**

Polyneuropathy (8C00-8C0Z)

8C00 **Idiopathic progressive neuropathy**

8C01 Inflammatory polyneuropathy

Acquired inflammatory peripheral neuropathies are of a presumed immune etiology and are classified on the basis of their clinical course: acute inflammatory demyelinating polyneuropathy (AIDP or Guillain-Barré syndrome) with the motor deficit reaching a maximal level by 28 days, and chronic inflammatory demyelinating polyneuropathy (CIDP) which has a slowly progressive course of two or more months or a relapsing remitting course. There are many variants of AIDP and CIDP.

8C01.0 Acute inflammatory demyelinating polyneuropathy

Progressive weakness of the limbs over a few days to 28 days, symmetrical deficit, areflexia, absent or mild sensory disturbance, elevated cerebrospinal fluid protein, and slowing of nerve conduction velocities are the cardinal features. The disorder may be preceded by upper respiratory or gastrointestinal infection or immunization 1 to 4 weeks prior to onset of the illness. Bifacial palsy may be present.

Inclusions: Acute Inflammatory Demyelinating Polyradiculoneuropathy

8C01.1 Post vaccinal neuropathy

8C01.2 Subacute inflammatory demyelinating polyneuropathy

Subacute inflammatory demyelinating polyneuropathy (SIDP) is a subacute progressive symmetric sensorial and/or motor disorder characterised by muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid (CSF) proteins. SIDP is an intermediate form between Guillain-Barr• syndrome (GBS) and chronic inflammatory demyelinating polyneuropathy (CIDP).

8C01.3 Chronic inflammatory demyelinating polyneuropathy

Chronic inflammatory demyelinating polyneuropathy is a chronic monophasic, progressive or relapsing symmetric sensorimotor disorder characterised by progressive muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid proteins.

8C01.Y Other specified inflammatory polyneuropathy

8C01.Z Inflammatory polyneuropathy, unspecified

8C03 Other secondary polyneuropathy

Coding Note: Code also the causing condition

8C03.0 Diabetic polyneuropathy

Coding Note: Always assign an additional code for diabetes mellitus.

Coded Elsewhere: Diabetic foot ulcer (BD54)

8C03.1 Polyneuropathy due to infectious diseases

Coding Note: Code also the causing condition

8C03.2 Polyneuropathy in neoplastic disease

Coding Note: Code also the causing condition

Mononeuropathy (8C10-8C1Z)

8C10 **Mononeuropathies of upper limb**

Damage to a single nerve or nerve group of the upper limb (not including central nervous structures such as the brain, brainstem or spinal cord), resulting in a loss of movement, sensation and/or autonomic function)

Coding Note: Code also the causing condition

Exclusions: current traumatic nerve disorder - see nerve injury by body region (Chapter 22)

8C10.0 **Carpal tunnel syndrome**

A compression neuropathy due to entrapment of the median nerve within the carpal tunnel at the wrist.

Coding Note: Code also the causing condition

8C10.1 **Lesion of ulnar nerve**

Coding Note: Code also the causing condition

Inclusions: Tardy ulnar nerve palsy

Exclusions: Injury of ulnar nerve at upper arm level (NC14.0)

Injury of ulnar nerve at forearm level (NC34.0)

Injury of ulnar nerve at wrist or hand level (NC55.0)

8C10.2 **Lesion of radial nerve**

Coding Note: Code also the causing condition

Exclusions: Injury of radial nerve at upper arm level (NC14.2)

Injury of radial nerve at forearm level (NC34.2)

Injury of radial nerve at wrist or hand level (NC55.2)

8C10.Y **Other specified mononeuropathies of upper limb**

Coding Note: Code also the causing condition

8C10.Z **Mononeuropathies of upper limb, unspecified**

Coding Note: Code also the causing condition

8C11 Mononeuropathies of lower limb

Damage to a single nerve or nerve group of the lower limb (not including central nervous structures such as the brain, brainstem or spinal cord), resulting in a loss of movement, sensation and/or autonomic function)

Coding Note: Code also the causing condition

Inclusions: Mononeuritis of lower limb

Exclusions: current traumatic nerve disorder - see nerve injury by body region (Chapter 22)

8C11.0 **Lesion of sciatic nerve**

Disease or damage involving the SCIATIC NERVE, which divides into the PERONEAL NERVE and TIBIAL NERVE (see also PERONEAL NEUROPATHIES and TIBIAL NEUROPATHY). Clinical manifestations may include SCIATICA or pain localised to the hip, PARESIS or PARALYSIS of posterior thigh muscles and muscles innervated by the peroneal and tibial nerves, and sensory loss involving the lateral and posterior thigh, posterior and lateral leg, and sole of the foot. The sciatic nerve may be affected by trauma; ISCHEMIA; COLLAGEN DISEASES; and other conditions.

Coding Note: Code also the causing condition

Exclusions: sciatica attributed to intervertebral disc disorder (FA80)

sciatica NOS (ME84.3)

Injury of sciatic nerve at hip or thigh level (NC74.0)

8C11.00 Sciatic nerve piriformis syndrome

8C11.0Y Other specified lesion of sciatic nerve

Coding Note: Code also the causing condition

8C11.0Z Lesion of sciatic nerve, unspecified

Coding Note: Code also the causing condition

8C11.1 **Meralgia paraesthetica**

Coding Note: Code also the causing condition

8C11.2 **Lesion of femoral nerve**

Coding Note: Code also the causing condition

Exclusions: Injury of femoral nerve at hip or thigh level (NC74.1)

8C11.3 **Lesion of common peroneal nerve**

Coding Note: Code also the causing condition

Exclusions: Injury of peroneal nerve at lower leg level (NC94.1)

8C11.4 **Lesion of tibial nerve**

Coding Note: Code also the causing condition

Exclusions: Injury of tibial nerve at lower leg level (NC94.0)

8C11.5 **Tarsal tunnel syndrome**

Coding Note: Code also the causing condition

8C11.6 **Lesion of plantar nerve**

Disease or damage to the medial and/or lateral plantar nerves, branches of the tibial nerve below the level of the tarsal tunnel secondary to insult.

Coding Note: Code also the causing condition

Exclusions: Tarsal tunnel syndrome (8C11.5)

Injury of lateral plantar nerve (ND15.0)

Injury of medial plantar nerve (ND15.1)

8C11.Y **Other specified mononeuropathies of lower limb**

Coding Note: Code also the causing condition

8C11.Z **Mononeuropathies of lower limb, unspecified**

Coding Note: Code also the causing condition

8C12 Certain specified mononeuropathies

8C12.0 **Intercostal neuropathy**

Peripheral neuropathy of the intercostal nerves

8C12.1 **Mononeuritis multiplex**

8C12.2 **Lesion of suprascapular nerve**

8C12.3 **Lesion of axillary nerve**

8C12.4 **Lesion of long thoracic nerve**

8C12.5 **Traumatic neuroma, not otherwise specified**

Exclusions: Neuroma of amputation stump (NE85.3)

8C12.Y **Mononeuropathy of other specified nerve**

8C1Y Mononeuropathy of other specified site

Coding Note: Code also the causing condition

8C1Z Mononeuropathy of unspecified site

Coding Note: Code also the causing condition

Hereditary neuropathy (8C20-8C2Z)

8C20 Hereditary motor and sensory neuropathy

Inclusions: Hereditary motor and sensory neuropathy, types I-IV

8C20.0 **Charcot-Marie-Tooth disease 1 demyelinating**

8C20.1 **Charcot-Marie-Tooth disease 2 axonal**

8C20.2 **Intermediate Charcot-Marie-Tooth disease**

8C20.Y **Other specified hereditary motor and sensory neuropathy**

8C20.Z **Hereditary motor and sensory neuropathy, unspecified**

8C21 Hereditary sensory or autonomic neuropathy

Coded Elsewhere: Primary erythromelalgia (EG00)

8C21.0 **Hereditary sensory and autonomic neuropathy type I**

Hereditary sensory autonomic type I neuropathies are autosomal dominant sensory-autonomic sensory polyneuropathies

8C21.1 **Hereditary sensory and autonomic neuropathy type III**

Hereditary sensory and autonomic neuropathy, type 3 (HSAN3) is an autosomal recessive disorder seen primarily in Ashkenazi Jewish children caused by a mutation in the I-kappa B kinase associated protein.

It is characterised by sensory dysfunction and severe impairment of the autonomic nervous system activity, resulting in multisystem dysfunction.

Symptoms can include insensitivity to pain and temperature, intact visceral pain, alacrima, hypoactive corneal and tendon reflexes and absence of lingual fungiform papillae.

8C21.2 **Hereditary sensory and autonomic neuropathy type IV**

Hereditary sensory and autonomic neuropathy, type 4 (HSAN4) is an inherited disorder characterised by anhidrosis, insensitivity to pain, self-mutilating behaviour and episodes of fever.

8C21.3 **Hereditary sensory and autonomic neuropathy type V**

Hereditary sensory and autonomic neuropathy, type 5 (HSAN5) is characterised by loss of pain perception and impaired temperature sensitivity, in the absence of any other major neurological anomalies.

8C21.Y **Other specified hereditary sensory or autonomic neuropathy**

8C21.Z **Hereditary sensory or autonomic neuropathy, unspecified**

8C2Y Other specified hereditary neuropathy

8C2Z Hereditary neuropathy, unspecified

8C4Y Other specified disorders of nerve root, plexus or peripheral nerves

8C4Z Disorders of nerve root, plexus or peripheral nerves, unspecified

Diseases of neuromuscular junction or muscle (8C60-8D0Z)

Diseases resulting from destruction or malfunction of the neuromuscular junction, a chemical synapse formed between the end of the motor nerve terminal and the voluntary muscle. Pathology can occur at the presynaptic or postsynaptic membrane and leads to dysfunction of neuromuscular transmission. Common diseases of this category include Myasthenia Gravis and Lambert Eaton Myasthenic Syndrome.

Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Myasthenia gravis is the most common autoimmune disease affecting the neuromuscular junction and is characterised by painless fatigable muscle weakness. It is caused by autoantibodies against neuromuscular junction proteins, either the nicotinic acetylcholine receptor (AChR) or the muscle specific tyrosine kinase (MuSK). Mutations in neuromuscular junction proteins cause congenital myasthenic syndromes. Other antibodies mediated conditions affecting the neuromuscular junction, including Lambert Eaton myasthenic syndrome and neuromyotonia.

Coded Elsewhere: Botulism (1A11)

Neuromuscular junction disorders due to toxicity (NE61)

8C60 **Myasthenia gravis**

Myasthenia gravis is the most common acquired auto-antibody mediated neuromuscular transmission disorder. Prevalence is 1–2 per 10,000 persons. Fluctuating weakness increasing with repeated activity and improving after a period of rest is the hallmark. Myasthenia Gravis with antibodies directed against postsynaptic proteins, usually the nicotinic acetylcholine receptor are the most prevalent. Other types are Myasthenia Gravis associated with muscle-specific kinase antibodies and MG with unknown autoantibodies (seronegative) Myasthenia Gravis.

There are three groups: 1. Purely ocular Myasthenia Gravis

2. Early-onset (<40-50 years) generalised Myasthenia Gravis

3. Late-onset generalised MG.

In about 15%, the disease can be classified as paraneoplastic, usually associated with a thymoma.

Coded Elsewhere: Transient neonatal myasthenia gravis (KB08.0)

8C60.0 Drug-induced myasthenia gravis

Some drugs can have clear effects on Myasthenia Gravis, including Neuromuscular junction blockers, antibiotics, prednisone, chloroquine, D-penicillamine, interferons, and others. In rapid-onset drug-induced Myasthenia Gravis, myasthenic signs develop within days which rapidly disappear after drug withdrawal. Anti-Acetylcholinesterase antibodies are absent. This disorder may unmask a pre-existing neuromuscular transmission disorder or may exacerbate pre-existing Myasthenia Gravis, i.e. subclinical Myasthenia Gravis becomes manifest after drug treatment, or known MG becomes more severe. Certain drugs are linked with aggravation of Myasthenia Gravis, including pain management medications, tricyclic antidepressants and some antiepileptic medications, and should be used with caution.

8C60.Y Other specified myasthenia gravis

8C60.Z **Myasthenia gravis, unspecified**

8C61 Congenital myasthenic syndromes

Congenital myasthenic syndrome is a heterogeneous group of genetically determined diseases. There are four well-defined categories: Congenital myasthenic syndrome with presynaptic defect, Synaptic basal lamina-associated CMS, Congenital myasthenia with postsynaptic defect, CMS with glycosylation deficiency, and the remaining category is that of unidentified CMS.

8C62 Lambert-Eaton syndrome

Lambert-Eaton myasthenic syndrome, 20 times as rare as Acetylcholine receptor positive Myasthenia gravis with a prevalence of 3.42 per million, is an immune-mediated disease of the neuromuscular junction. Clinically the disease is characterised by proximal weakness of the legs. In most patients, the weakness extends to other muscles including the oculobulbar ones. Autonomic symptoms (dry mouth, erectile dysfunction, constipation) are frequent. Tendon reflexes are reduced. Repetitive nerve stimulation shows low Compound muscle action potentials, decrement >10% al low frequency and increment >100% after maximum voluntary contraction at high frequency.

8C6Y Other specified myasthenia gravis and neuromuscular junction disorders

8C6Z Unspecified myasthenia gravis or neuromuscular junction disorders

Primary disorders of muscles (8C70-8C7Z)

Disorders in which the primary symptom of muscle weakness is secondary to a specific dysfunction of a muscle fiber.

Exclusions: Metabolic disorders (5C50-5D2Z)

Arthrogryposis multiplex congenita (LD26.41)

Coded Elsewhere: Idiopathic rhabdomyolysis (FB32.20)

Idiopathic inflammatory myopathy (4A41)

8C70 Muscular dystrophy

Progressive, hereditary skeletal muscle diseases characterised by muscle weakness, wasting, defects in muscle proteins, necrosis of muscle tissue and replacement of muscle tissue with connective and fatty tissue.

Coded Elsewhere: Muscular dystrophy affecting extraocular muscle (9C82.1)

Barth syndrome (5C50.E0)

Epidermolysis bullosa simplex with muscular dystrophy (EC30)

8C70.0 **Becker muscular dystrophy**

8C70.1 **Duchenne muscular dystrophy**

Duchenne muscular dystrophy (DMD) is a severe X-linked myopathy caused by mutation in the dystrophin gene with symptoms appearing before the age of 6 with a rapid disease progression. Symptoms may include fatigue, learning difficulties (the IQ can be below 75), Muscle weakness, problems with motor skills, frequent falls and progressive difficulty walking.

8C70.2 **Emery-Dreifuss muscular dystrophy**

Emery-Dreifuss muscular dystrophy (EDMD) is a muscle disease characterised by muscular weakness and atrophy, with early contractures of the tendons and cardiac involvement (arrhythmias, cardiomyopathy).

8C70.3 **Facioscapulohumeral muscular dystrophy**

Facioscapulohumeral muscular dystrophy (FSHD) is an autosomal dominantly inherited muscle disease characterised by progressive muscle weakness with initial focal involvement of the facial, shoulder and arm muscles.

8C70.4 **Limb-girdle muscular dystrophy**

Limb-girdle muscular dystrophy (LGMD) constitutes a group of genetically determined, progressive disorders of muscles, in which the pelvic or shoulder girdle musculature is predominantly or primarily involved. It may be inherited in an autosomal recessive or dominant fashion.

8C70.40 Dominant limb-girdle muscular dystrophy

The Limb Girdle Muscular Dystrophies (LGMD) are a group of genetic disorders characterised predominantly by progressive wasting and weakness of proximal limb girdle muscles, including pelvic, shoulder, upper arm and thigh muscles. The onset symptoms usually varies from early childhood to late adulthood, and the progression rate and distribution of weakness and wasting also varies considerably among individuals and genetic subtypes. There are currently 8 autosomal dominant LGMDs (LGMD1), linked to specific gene mutations. Dominant LGMDs are often allelic with other clinical disorders, including the myofibrillar myopathies or dilated cardiomyopathy.

Exclusions: Secondary myopathies (8C80-8C8Z)

Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

8C70.41 Recessive limb-girdle muscular dystrophy

Autosomal recessive limb girdle muscular dystrophies (LGMD2) are a group of genetically heterogeneous diseases that are typically characterised by progressive weakness and wasting of the shoulder and pelvic girdle muscles. Many of the more than 20 different conditions show overlapping clinical features with other forms of muscular dystrophy, congenital, myofibrillar or even distal myopathies and also with acquired muscle diseases. Although individually extremely rare, all types of LGMD2 together form an important differential diagnostic group among neuromuscular diseases.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

8C70.4Y Other specified limb-girdle muscular dystrophy

8C70.4Z Limb-girdle muscular dystrophy, unspecified

8C70.5 Scapuloperoneal muscular dystrophy

Scapuloperoneal muscular dystrophies are a group of genetically heterogeneous myopathies characterised by progressive weakness and wasting of scapular and anterior leg muscles. Emery-Dreifuss muscular dystrophy is a classic scapuloperoneal muscular dystrophy associated with early contractures and cardiac arrhythmia, but other muscle disorders can also present with a scapuloperoneal phenotype.

Exclusions: Secondary myopathies (8C80-8C8Z)

Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

8C70.6 Congenital muscular dystrophy

Congenital muscular dystrophies with central nervous system abnormalities are a heterogeneous group of autosomal recessively inherited degenerative muscle disorders associated with cerebral and cerebellar dysplasia, white matter abnormalities and ocular abnormalities in some subtypes.

8C70.Y Other specified muscular dystrophy

8C70.Z Muscular dystrophy, unspecified

8C71 Myotonic disorders

Group of inherited muscular disorders associated with clinical and/or electrical myotonia. Myotonia is defined clinically as the occurrence of “delayed relaxation of muscle after voluntary contraction or percussion.”

8C71.0 Myotonic dystrophy

Myotonic dystrophy is a group of inherited muscular disorders. It is the most common form of muscular dystrophy that begins in adulthood. Myotonic dystrophy is characterised by progressive muscle wasting and weakness, and prolonged muscle contractions (myotonia) that are not able to relax after use. Other signs and symptoms of myotonic dystrophy include slurred speech or temporary locking of their jaw, cataracts and cardiac conduction defects. In affected men, hormonal changes may lead to early balding and infertility. The clinical severity varies widely among affected patients, even among members of the same family.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

Coded Elsewhere: Myotonic cataract (9B10.2Y)

8C71.1 Chondrodystrophic myotonia

Schwartz-Jampel syndrome is a congenital myotonic syndrome characterised by myotonia that results in a characteristic facies with blepharophimosis and a puckered facial appearance, and osteoarticular abnormalities leading to limited joint mobility.

8C71.2 Myotonia congenita

Thomsen and Becker disease are myotonic disorders characterised by slow muscle relaxation associated with hyperexcitation of the muscle fibres occurring within the first few months after birth. The myotonia is unusual in that it is relieved by exercise (warm-up effect). Autosomal dominant myotonia congenita (Thomsen disease) is a non-dystrophic muscle disorder caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is clinically characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Autosomal recessive myotonia congenita (Becker disease) is caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is a non-dystrophic skeletal muscle disorder characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Most patients have symptom onset in the legs, which later progresses to the arms, neck, and facial muscles. Many patients show marked hypertrophy of the lower limb muscles. Transient muscle weakness is a characteristic feature.

8C71.3 Drug-induced myotonia

Drug-induced myotonia refers to the myotonia-inducing effects of certain drugs. Hypocholesterolaemic agents may induce myotonia by altering the sterol composition of the muscle cell membrane, while other drugs including beta-adrenergic blockers and agonists, succinylcholine and diuretics may exacerbate or unmask pre-existing myotonia.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

8C71.4 **Neuromyotonia**

Neuromyotonia or Isaac's syndrome is an immune-mediated peripheral nerve disorder characterised by continuous muscle fibre activity at rest resulting in muscle stiffness, cramps, myokymia, and pseudomyotonia.

8C71.5 **Pseudomyotonia**

The term pseudomyotonia (slow relaxation of muscles after voluntary contraction) describes the clinical appearance of myotonia in the absence of myotonic discharges on the electromyography. Pseudomyotonia is most commonly observed as the slow-relaxing or “hung-up” tendon reflexes of hypothyroidism, although other causes are described. Pseudomyotonia is seen in about one-third of patients with Isaacs syndrome, particularly with handgrip, but also after eye and jaw closure; rarely, this can be the first symptom.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

8C71.Y **Other specified myotonic disorders**

8C71.Z **Myotonic disorders, unspecified**

8C72 Congenital myopathies

8C72.0 **Congenital myopathy with structural abnormalities**

Distinct group of inherited disorders of skeletal muscles which have characteristic structural abnormalities on muscle immuno-histochemistry.

Coding Note: Code also the causing condition

Exclusions: Secondary myopathies (8C80-8C8Z)

Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

8C72.00 Nemaline myopathy

Nemaline myopathy encompasses a large spectrum of congenital myopathies characterised by hypotonia, weakness and depressed or absent deep tendon reflexes, with pathologic evidence of nemaline bodies (rods) on muscle biopsy.

8C72.01 Centronuclear myopathy

Centronuclear myopathy (CNM) is an inherited neuromuscular disorder characterised by clinical features of a congenital myopathy and centrally placed nuclei on muscle biopsy. It encompasses the X-linked form, the autosomal recessive form and the autosomal dominant form with a highly variable clinical presentation.

8C72.02 Central core disease

Central core disease (CCD) is an inherited neuromuscular disorder characterised by central cores on muscle biopsy and clinical features of a congenital myopathy (hypotonia and motor developmental delay) and is characterised by predominantly proximal weakness, pronounced in the hip girdle.

8C72.0Y Other specified congenital myopathy with structural abnormalities

Coding Note: Code also the causing condition

8C72.0Z Congenital myopathy with structural abnormalities, unspecified

Coding Note: Code also the causing condition

8C72.1 Congenital myopathy with no structural abnormalities

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

8C72.Y Other specified congenital myopathies

8C72.Z Congenital myopathies, unspecified

8C73 Mitochondrial myopathies

Mitochondrial myopathies are heterogeneous group of disorders caused by dysfunction of mitochondrial oxidative phosphorylation and can be classified according to the associated biochemical, genetic defects (in the mitochondrial DNA or in nuclear encoded proteins) or clinical phenotype. Exclude: defects of mitochondrial respiratory chain, Kearns-Sayre syndrome, myoclonic epilepsy with ragged red fibres (MERRF)

Coded Elsewhere: Leigh syndrome (5C53.24)

Progressive external ophthalmoplegia (9C82.0)

8C73.0 Autosomal recessive cardiomyopathy or ophthalmoplegia

Autosomal recessive cardiomyopathy and ophthalmoplegia is a childhood-onset disease characterised by progressive external ophthalmoplegia, mild facial and proximal limb weakness, and severe cardiomyopathy. Muscle biopsies shows ragged-red and cytochrome C oxidase-negative fibres; the activities of several complexes in the electron-transport chain are decreased. The combination of progressive external ophthalmoplegia, cardiomyopathy, and multiple mtDNA deletions is thought to be due to a defect of communication between the nuclear and mitochondrial genomes.

Exclusions: Secondary myopathies (8C80-8C8Z)

Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

8C73.1 Neuropathy, ataxia, and retinitis pigmentosa

Neuropathy, Ataxia, and Retinitis Pigmentosa (NARP) syndrome is a clinically heterogeneous oxidative phosphorylation disorder often characterised by a combination of sensory-motor neuropathy, cerebellar ataxia, and night blindness.

8C73.Y Other specified mitochondrial myopathies

8C73.Z Mitochondrial myopathies, unspecified

8C74 Periodic paralyses or disorders of muscle membrane excitability

These are group of disorders caused by malfunctioning of the ion channels in skeletal muscle membranes causing the cells to depolarize leading to weakness or paralysis. The common triggers include cold, heat, high carbohydrate meals, stress, excitement, physical exertion etc..

8C74.0 Paramyotonia congenita

Paramyotonia congenita of Von Eulenburg is a skeletal muscle disease characterised by exercise- or cold-induced myotonia and muscle weakness.

8C74.1 Periodic paralysis

Rare group of neuromuscular disorders that are associated with defects in ion channels. Characterized by intermittent episodes of severe weakness of the limbs usually after heavy exercise, fasting, or high carbohydrate meals. The three major types of inherited periodic paralysis include hypokalemic periodic paralysis, hyperkalemic periodic paralysis, and Andersen–Tawil syndrome.

8C74.10 Hypokalaemic periodic paralysis

Hypokalaemic periodic paralysis (hypoPP) is a muscle channelopathy characterised by episodes of muscle paralysis lasting from a few to 24-48 hours and associated with a fall in blood potassium levels.

Coded Elsewhere: Thyrotoxic periodic paralysis (5A02.Y)

8C74.11 Hyperkalaemic periodic paralysis

Hyperkalaemic periodic paralysis (HyperPP) is a muscle disorder characterised by episodic attacks of muscle weakness associated with an increase in serum potassium concentration.

Coded Elsewhere: Long QT syndrome type 7 (BC65.0)

8C74.1Y Other specified periodic paralysis

8C74.1Z Periodic paralysis, unspecified

8C74.Y Other specified periodic paralyses or disorders of muscle membrane excitability

8C74.Z Periodic paralyses or disorders of muscle membrane excitability, unspecified

8C75 Distal myopathies

Distal myopathies are heterogeneous group of myopathies characterised clinically by progressive weakness and atrophy starting in distal muscles and progressing to proximal ones, and histologically by nonspecific myopathic features on muscle biopsy.

8C76 **Myofibrillar myopathy**

Myofibrillar myopathies are a heterogeneous group of disorders, characterised by the pathologic finding of myofibrillar disruption on electron microscope with a spectrum of histological abnormalities including excessive desmin accumulation in muscle fibres.

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

8C77 **Ocular myopathy**

Slowly progressive weakness of ocular muscles, usually characterised by decreased mobility of the eye and drooping of the upper lid. The disorder may be unilateral or bilateral, and may be caused by central or peripheral nervous system lesion or by a neuromuscular disease.

Exclusions: Ocular myopathy with mitochondrial abnormalities (9C82.0)

oculopharyngeal muscular dystrophy (9C82.1)

Ocular muscular dystrophy (9C82.1)

8C78 **Malignant hyperthermia or hyperpyrexia**

Malignant hyperthermia is a pharmacogenetic disorder of skeletal muscle that presents as a hypermetabolic response to potent volatile anaesthetic gases such as halothane, sevoflurane, desflurane and the depolarizing muscle relaxant succinylcholine, and rarely in humans, to stresses such as vigorous exercise and heat. May be caused by a mutation in the Ryonadine Receptor 1 gene.

8C7Y **Other specified primary disorders of muscles**

8C7Z **Primary disorders of muscles, unspecified**

Secondary myopathies (8C80-8C8Z)

This is a group of conditions in which the muscle fibres are dysfunctional, resulting in muscle weakness. The myopathy is caused by an underlying disorder.

Exclusions: Arthrogryposis multiplex congenita (LD26.41)

Ischaemic infarction of muscle (FB32.2)

Coded Elsewhere: Alcoholic myopathy (8D44.1)

Myopathy due to toxicity (8D43.3)

8C80 **Drug-induced myopathy**

Myopathy caused by drugs that ranges from mild myalgias with or without mild weakness to chronic myopathy with severe weakness, to massive rhabdomyolysis with acute renal failure. It could be due to several different mechanisms including direct myotoxicity, immune mediated and indirect muscle damage through drug-induced coma, drug-induced hypokalaemia, drug-induced hyperkinetic states or dystonic states.

8C81 Autoimmune myopathy

Autoimmune myopathy is a subgroup of idiopathic inflammatory myopathies, which despite diverse causes, have the common histopathological features of myocyte necrosis without significant inflammation. Patients present with a subacute severe symmetrical proximal myopathy, associated with a markedly elevated creatine kinase level. These are most likely immune-mediated, as they respond to immunotherapy. it is often accompanied by statin therapy, connective tissue diseases, cancer, and autoantibodies specific for signal recognition particle (SRP) or 3-hydroxy-3-methylglutaryl–coenzyme A reductase (HMGCR).

Coding Note: Code also the causing condition

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

8C82 Myopathy in certain specified infectious or parasitic disease

Myopathy in certain specified infectious or parasitic disease is an uncommon group of muscle diseases caused by a broad range of bacterial, fungal, parasitic, and viral agents. Bacterial organisms cause pyomyositis, psoas abscess, Staphylococcus aureus myositis, group A streptococcal necrotizing myositis, group B streptococcal myositis, clostridial gas gangrene, and nonclostridial myositis. Fungal myositis is rare and usually occurs among immunocompromised hosts. Parasitic myositis is most commonly a result of trichinosis or cystericercosis, but other protozoa or helminths may be involved. Viruses may cause benign acute myositis, pleurodynia, acute rhabdomyolysis, or an immune-mediated polymyositis.

Coding Note: Code also the causing condition

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

8C83 Myopathy in certain specified endocrine disease

Myopathy in certain specified endocrine disease refers to muscle disorders associated with adrenal dysfunction (as steroid myopathy), thyroid dysfunction (as in myxoedema coma or thyrotoxic myopathy), parathyroid dysfunction (as in multiple endocrine neoplasia), pituitary dysfunction, and islands of Langerhans dysfunction (as in diabetic myopathy from ischemic infarction of the femoral muscles). Steroid myopathy is the most common endocrine myopathy. These conditions are usually reversible with correction of the underlying endocrine disturbance.

Coding Note: Code also the causing condition

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

8C84 **Secondary rhabdomyolysis**

Secondary rhabdomyolysis occurs when the primary effect of a aetiological factor results in a functional or biochemical state which is conducive to the development of ischemic, degenerative, necrotic or membrane destabilizing changes in muscle, producing the clinical and biochemical features of rhabdomyolysis. Most frequently, rhabdomyolysis is secondary to a metabolic derangement often genetic in nature, as result of abnormally excessive movement, excessive isometric tension by attempted movement against resistance, or coma leading to increased intramuscular pressure, ischemia, hypoxia and necrosis. Secondary rhabdomyolysis can also be caused by a mutation in various genes (RYR1, LPIN).

Coding Note: Code also the causing condition

Exclusions: Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

8C8Y **Other specified secondary myopathies**

Coding Note: Code also the causing condition

8C8Z **Secondary myopathies, unspecified**

Coding Note: Code also the causing condition

8D0Y **Other specified diseases of neuromuscular junction or muscle**

8D0Z **Diseases of neuromuscular junction or muscle, unspecified**

Cerebral palsy (8D20-8D2Z)

Exclusions: Hereditary spastic paraplegia (8B44.0)

8D20 **Spastic cerebral palsy**

Spastic cerebral palsy is characterised by increased muscle tone associated with hyperactive muscle stretch reflexes (deep tendon reflexes) and an increase in resistance to rapid muscle stretch. Extensor plantar responses are commonly present.

8D20.0 Spastic unilateral cerebral palsy

Spastic unilateral cerebral palsy is a form of cerebral palsy in which the spasticity is confined to one side; it is often accompanied by cortical sensory impairment and varying degrees of hemineglect, demonstrable by testing stereognosis and graphesthesia. Early hand preference is often the first sign of this disorder, and may be apparent in the first months of life.

8D20.1 Spastic bilateral cerebral palsy

8D20.10 Spastic quadriplegic cerebral palsy

Spastic quadriplegic cerebral palsy is a form of cerebral palsy in which spasticity is generalised, yet most marked in the legs. Opisthotonic posturing is often apparent in infancy, and head movement may elicit forced extension of the arms and legs. Suprabulbar palsy is often present, causing impaired swallowing and articulation ('spastic dysarthria').

Inclusions: Spastic tetraplegic cerebral palsy

8D20.11 Spastic diplegic cerebral palsy

Spastic diplegic cerebral palsy is a form of cerebral palsy in which spasticity is most marked in the legs, with mild, if any, involvement of the arms.

8D20.1Z Spastic bilateral cerebral palsy, unspecified

8D20.Y Other specified spastic cerebral palsy

8D20.Z Spastic cerebral palsy, unspecified

8D21 Dyskinetic cerebral palsy

Dyskinetic cerebral palsy, also known as extrapyramidal cerebral palsy is characterised by impairment of voluntary movement because of the presence of interfering involuntary movements, and inappropriate co-contraction of agonist and antagonist muscles (dystonia). This group of disorders includes choreoathetotic cerebral palsy and dystonic cerebral palsy. The former is characterised by large amplitude, involuntary movements of mainly distal limbs(athetosis) with or without small amplitude, fleeting, asymmetric contractions of individual muscle groups (chorea).

Dystonic cerebral palsy predominantly affects proximal trunk and limb muscles, which may show slow, persistent movements, leading to the adoption of unusual postures, such as torticollis.

Inclusions: Athetoid cerebral palsy

8D22 Ataxic cerebral palsy

Ataxic cerebral palsy is dominated by signs of cerebellar dysfunction, including hypotonia, ataxia, dysdiadochokinesis, dysmetria, dysarthria and nystagmus. Reflexes may be pendular, although there are often also signs of spasticity.

8D23 Worster-Drought syndrome

Worster-Drought syndrome (WDS) is a form of cerebral palsy characterised by congenital pseudobulbar (suprabulbar) paresis manifesting as selective weakness of the lips, tongue and soft palate, dysphagia, dysphonia, drooling and jaw jerking.

8D2Y Other specified cerebral palsy

8D2Z Cerebral palsy, unspecified

Nutritional or toxic disorders of the nervous system (8D40-8D4Z)

8D41.0 Peripheral neuropathy due to vitamin B6 hyperalimentation

8D41.1 Myopathy due to hypercalcaemia

8D41.2 Pseudotumour Cerebri related to Hypervitaminosis A

8D41.Y Other specified neurological disorders due to an excess of micro or macro nutrients

Coding Note: Code also the causing condition

8D41.Z Neurological disorders due to an excess of micro or macro nutrients, unspecified

Coding Note: Code also the causing condition

8D42 Neurological disorders due to overweight or obesity in adults or children

Neurological disorders that arise from the metabolic dysfunction, inflammation, and dyslipidemia caused by overweight (BMI > 25) or obese (BMI >30) status. Examples include mild cognitive impairment secondary to hippocampal alteration, hypothalamic dysfunction, autonomic dysfunction, peripheral polyneuropathy, and obstructive sleep apnea.

Coding Note: Code also the causing condition

8D43 Neurological disorders due to toxicity

Coded Elsewhere: Neuromuscular junction disorders due to toxicity (NE61)

Intracranial hypertension associated with medication or toxin exposure (8D60.Y)

Myelopathy due to toxicity (8B42)

8D43.0 Encephalopathy due to toxicity

8D43.00 Encephalopathy due to ammonia

8D43.0Y Other specified encephalopathy due to toxicity

8D43.0Z Encephalopathy due to toxicity, unspecified

8D43.1 Cognitive impairment due to toxicity

These are conditions of impaired cognition due to the toxicity of substances.

Coded Elsewhere: Dementia due to exposure to heavy metals and other toxins (6D85.2)

Dementia due to carbon monoxide poisoning (6D84.Y)

Post radiation dementia (6D84.Y)

Dementia or parkinsonism due to manganese toxicity (6D84.Y)

8D43.2 Neuropathy due to toxicity

In considering the diagnosis of toxic neuropathy, two criteria should be met: (1) Exposure can be verified and temporally related to the onset of clinical symptoms. Neuropathic symptoms usually occur concurrently with the exposure or following a variable latency of up to several months. (2) There must be neurological signs and abnormal electrodiagnostic studies, because many toxic neuropathies are subclinical, subjective symptoms may or may not occur. Removal from exposure results in cessation of progression of symptoms and the deficit. Most toxins produce symmetrical axonal degeneration in a length-dependent pattern, beginning in the distal segments of the long and large-calibre nerve fibres eventually spreading proximally with continued exposure. In addition to motor and /or sensory deficits, severe pain may be a characteristic feature.

Coded Elsewhere: Alcoholic polyneuropathy (8D44.0)

8D43.20 Drug-induced polyneuropathy

8D43.21 Post radiation polyneuropathy

Coded Elsewhere: Alcoholic myopathy (8D44.1)

Myopathy due to other toxic agents (8C8Y)

8D43.4 **Movement disorders due to toxicity**

Movements of the body, such as hyperkinesias, dyskinesias, myoclonus, chorea, tremor and tics produced by toxicity either by toxin or drug, ie toxicity by manganese, neuroleptic drugs,calcium channel blockers, gastrointestinal prokinetics, antiarrhythmics and antidepressants may induce Parkinsonism.

Coded Elsewhere: Toxin-induced parkinsonism (8A00.2Y)

Chorea due to toxins (8A01.1Y)

Dystonia due to toxins (8A02.1Y)

Ataxia due to certain specified toxins (8A03.3Y)

8D43.5 **Cassava poisoning**

Symmetrical, non-progressive, non-remitting spastic paraparesia occurring in epidemic and endemic forms with a predilection for children and young women1, 2. The unknown etiology is related to consumption of bitter cassava roots with very minimal protein supplementation.

Coded Elsewhere: Myelopathy due to konzo (8B42)

8D43.Y **Other specified neurological disorders due to toxicity**

8D43.Z **Neurological disorders due to toxicity, unspecified**

8D44 Alcohol-related neurological disorders

Coded Elsewhere: Dementia due to use of alcohol (6D84.0)

8D44.0 **Alcoholic polyneuropathy**

8D44.1 **Alcoholic myopathy**

Myopathy secondary to alcohol use and includes acute and chronic alcoholic myopathy. Several forms have been described: acute necrotizing myopathy, acute hypokalaemic myopathy, chronic alcoholic myopathy, asymptomatic alcoholic myopathy, and alcoholic cardiomyopathy.

8D44.Y **Other specified alcohol-related neurological disorders**

8D44.Z **Alcohol-related neurological disorders, unspecified**

8D4Y Other specified nutritional or toxic disorders of the nervous system

8D4Z Nutritional or toxic disorders of the nervous system, unspecified

Disorders of cerebrospinal fluid pressure or flow (8D60-8D6Z)

8D60 Increased intracranial pressure

An increase in pressure within the skull caused by changes in the volumes of the intracranial components, such as brain matter, CSF and blood, or by the presence of a pathological mass entity.

8D60.0 Brain herniation syndromes

The shift or displacement of brain tissue due to mass effect from its normal location to a region it does not occupy.

8D60.1 Cerebral oedema

Is an excess accumulation of fluid in the intracellular and/or extracellular spaces of the brain.

Exclusions: Traumatic cerebral oedema (NA07.2)

Cerebral oedema due to birth injury (KA40.1)

8D60.Y Other specified increased intracranial pressure

8D60.Z Increased intracranial pressure, unspecified

8D61 Intracranial hypotension

The syndrome of intracranial hypotension is a single pathophysiological entity of diverse origin. Usually it is characterised by an orthostatic headache, one that occurs or worsens with upright posture. Patients with chronic headaches or are asymptomatic have been described.

8D61.0 Spontaneous intracranial hypotension

The exact cause of spontaneous spinal CSF leaks usually remains unknown, but a combination of an underlying weakness of the spinal meninges and a trivial precipitating event is generally suspected.

8D61.1 Secondary intracranial hypotension

Coding Note: Code also the causing condition

8D61.Y Other specified intracranial hypotension

8D61.Z Intracranial hypotension, unspecified

8D62 Cerebrospinal fluid rhinorrhoea

8D63 Cerebrospinal fluid otorrhoea

8D64 Hydrocephalus

Coded Elsewhere: Neonatal hydrocephalus (KB05)

8D64.0 Communicating hydrocephalus

Communicating hydrocephalus, also known as non-obstructive hydrocephalus, is a disorder characterised by impaired cerebrospinal fluid reabsorption in the absence of any CSF-flow obstruction between the ventricles and subarachnoid space.

8D64.00 Increased cerebrospinal fluid production

Is a type of communicating hydrocephalus caused by increased CSF production.

8D64.01 Congenital agenesis of arachnoid villi

8D64.02 Post haemorrhagic hydrocephalus

8D64.03 Post traumatic hydrocephalus

8D64.04 Normal-pressure hydrocephalus

A clinical syndrome mainly comprising gait disturbance, dementia, and urinary incontinence, and is associated with dilatation of the ventricular system of the brain. Most of the times demonstrating normal cerebrospinal fluid (CSF) pressure at lumbar puncture.

8D64.0Y Other specified communicating hydrocephalus

8D64.0Z Communicating hydrocephalus, unspecified

8D64.1 **Non-communicating hydrocephalus**

It represents a form of hydrocephalus where there is an excessive accumulation of CSF within the ventricles caused by blockage of its pathway and due to several causes.

Coded Elsewhere: Neonatal obstructive hydrocephalus (KB05.0)

8D64.10 Hydrocephalus due to structural malformations

Ventricular enlargement due to an accumulation of cerebrospinal fluid secondary to obstruction caused by a structural abnormality such as Chiari malformations or aqueductal stenosis.

Coded Elsewhere: Dandy-Walker malformation with hydrocephalus (LA06.0)

8D64.1Y Other specified non-communicating hydrocephalus

8D64.1Z Non-communicating hydrocephalus, unspecified

8D64.2 **Ex-vacuo hydrocephalus**

Hydrocephalus ex-vacuo occurs when there is damage to the brain caused by stroke, injury, or radiation, and there may be an actual shrinkage of brain substance. Although there is more CSF than usual, the CSF pressure itself is normal in hydrocephalus ex-vacuo.

8D64.Z **Hydrocephalus, unspecified**

8D65 Cerebrospinal fluid fistula

Cerebrospinal fluid fistula is a condition in which the cerebrospinal fluid (CSF) held in and around the human brain and spinal cord leaks out of the surrounding protective sac, the dura, for no apparent reason or due to several pathological processes.

8D66 Syringomyelia or syringobulbia

In syringomyelia, there is fluid-filled tubular cavitation (syrinx formation) within the central spinal cord. The syrinx can elongate, enlarge and expand into the grey and white matter and, as it does so, it compresses the nervous tissue of the corticospinal and spinothalamic tracts and the anterior horn cells. This leads to the various neurological symptoms and signs. If the syrinx extends into the brainstem, syringobulbia results.

Exclusions: Congenital hydromyelia (LA07.3)

8D66.0 Idiopathic syringomyelia

A condition in which the syrinx has no identifiable cause and which is difficult to treat. Most large and/or symptomatic syrinxes can treated with syrinx shunting.

8D66.1 Syringomyelia due to certain specified cause

A condition when the syrinx is associated with an underlying cause.

Coding Note: Code also the causing condition

8D66.2 Syringobulbia

Chronic progressive degenerative disorder of the CNS characterized by the formation of a fluid filled cavity known as a syrinx in the spinal cord that extends upwards to involve the medulla and pons. May occur in isolation or secondary to may also occur secondary to neoplasms, traumas, deformities of the craniocervical junction or meningitis.

8D66.Y Other specified syringomyelia or syringobulbia

8D66.Z Syringomyelia or syringobulbia, unspecified

8D67 Intracranial arachnoid cyst

A fluid filled cavity within the arachnoid membrane which may be congenital or acquired. Acquired causes include trauma, infection and surgery. The most common site is the middle cranial fossa. Factors that influence whether the cyst causes symptoms include its size and location. Symptoms if present may include headache, dizziness, nausea and vomiting, seizures, developmental delay

8D68 Porencephalic cyst

Cavity within the cerebral hemisphere that communicates directly with the ventricular system. Ischemic necrosis in utero or later in life can cause the adjacent ventricular region to expand into the stroke cavity forming, forming a cyst.

8D6Y Other specified disorders of cerebrospinal fluid pressure or flow

8D6Z Disorders of cerebrospinal fluid pressure or flow, unspecified

Disorders of autonomic nervous system (8D80-8D8Z)

This is a group of conditions characterised as being in or associated with the autonomic nervous system, the

component of the peripheral nervous system that regulates involuntary physiologic processes.

Inclusions: Disorder of parasympathetic nervous system

Coded Elsewhere: Paroxysmal autonomic disorders

Hypohidrosis (EE01)

8D80 **Congenital malformations of the autonomic nervous system**

8D81 **Inherited autonomic nervous system disorders**

8D82 **Autoimmune disorders involving the autonomic nervous system**

8D83 **Autonomic nervous system disorder due to infection**

Coding Note: Code also the causing condition

8D84 **Pure autonomic nervous system failure**

Pure autonomic failure is a sporadic, adult onset, slowly progressive disorder associated with accumulation of synuclein in peripheral autonomic neurons resulting in orthostatic hypotension, bladder and sexual dysfunction.

8D85 **Autonomic nervous system disorder due to substances**

Coded Elsewhere: Neuroleptic malignant syndrome (8A0Y)

8D86 **Autonomic nervous system hyperactivity**

8D87 **Autonomic nervous system disorder due to certain specified neurodegenerative disorder**

8D87.0 **Multiple system atrophy**

Multiple system atrophy (MSA) is a rare neurodegenerative disorder characterised by varied combinations of parkinsonian, cerebellar, autonomic (erectile dysfunction, bladder dysfunction), orthostatic hypotension) and pyramidal features. The disease belongs to the group of alpha-synucleinopathies, a group of diseases characterised by aggregation of alpha-synuclein in affected brain regions. There are two different types MSA-P (with parkinsonism) and MSA-C (with cerebellar dysfunction)

8D87.00 Multiple system atrophy, Cerebellar type

8D87.01 Multiple system atrophy, Parkinsonism

This is a progressive disorder of the central and autonomic nervous systems, characterised by orthostatic hypotension (an excessive drop in blood pressure when standing up), which causes dizziness or fainting. It can occur without orthostatic hypotension, but instead have urinary involvement (urgency/incontinence). This type includes symptoms of Parkinson's disease such as slow movement, rigidity, and tremor.

Exclusions: Spinocerebellar ataxia (8A03.16)

Pure autonomic nervous system failure (8D84)

8D87.0Y Other specified multiple system atrophy

8D87.0Z Multiple system atrophy, unspecified

8D87.Y **Other specified autonomic nervous system disorder due to specified neurodegenerative disorder**

8D88 Autonomic neuropathies

Coded Elsewhere: Hereditary sensory or autonomic neuropathy (8C21)

8D88.0 **Autonomic neuropathy due to sodium channelopathies**

Coded Elsewhere: Paroxysmal extreme pain disorder (8E43.Y)

Primary erythromelalgia (EG00)

Secondary erythromelalgia (EG00)

8D88.1 **Autonomic neuropathy due to diabetes mellitus**

Dysfunction of the autonomic nervous system due to diabetes mellitus that presents as functional complications such as resting tachycardia, exercise intolerance, orthostatic hypotension, constipation, gastroparesis, sweating, bladder distention, and impotence.

Coding Note: Always assign an additional code for diabetes mellitus.

8D88.2 **Immune mediated autonomic neuropathy**

Coding Note: Code also the causing condition

8D88.3 **Autonomic disorder due to toxins**

8D88.4 **Autonomic neuropathy in endocrine and metabolic diseases**

Coding Note: Code also the causing condition

8D88.Y **Other specified autonomic neuropathies**

8D88.Z **Autonomic neuropathies, unspecified**

8D89 Disorders of orthostatic tolerance

Disorders characterized by symptomatic arterial hypotension (lightheadedness, fatigue) when assuming an upright position usually due to dysfunction of adrenergic regulation.

Coded Elsewhere: Orthostatic hypotension (BA21)

8D89.0 **Reflex syncope**

Reflex syncope is a transient loss of consciousness with spontaneous recovery and associated with loss of postural tone. Reflex syncope is the most common form of syncope and can occur in individuals with normal autonomic function. The mechanism is believed to be related to blood pooling in the legs followed by reduction in blood return to the heart which triggers a sympathetic tone increase. Vigorous cardiac contractions with an underfilled ventricle is hypothesized to cause reflex loss of sympathetic tone and vagotonia.

8D89.1 **Syncope due to autonomic failure**

8D89.2 Postural orthostatic tachycardia syndrome

Postural Orthostatic Tachycardia Syndrome is a type of chronic orthostatic intolerance lasting three months or longer associated with excessive upright tachycardia in the absence of orthostatic hypotension, plus a constellation of typically daily symptoms which may include lightheadedness, dizziness, nausea, dyspnoea, diaphoresis, headache, fatigue and other symptoms of autonomic dysfunction. Excessive tachycardia is defined by present consensus as a heart rate increase of at least 30 beats per minute in adults (40 beats per minute for adolescents), or a heart rate greater than 120 beats per minute, within 10 minutes of upright tilt table testing.

8D89.3 Baroreflex failure

8D89.Y Other specified disorders of orthostatic tolerance

8D89.Z Disorders of orthostatic tolerance, unspecified

8D8A Focal or segmental autonomic disorders

Coded Elsewhere: Trigeminal autonomic cephalalgias (8A82)
Hyperlacrimation (9A10.3)
Underproduction of tears (9A10.4)

8D8A.1 Horner syndrome

8D8A.2 Episodic anisocoria

This is a group of disorders in which periodic pupillary movements leading to changes in size. These are due to abnormal parasympathetic or sympathetic tone.

8D8A.Y Other specified focal or segmental autonomic disorders

8D8A.Z Focal or segmental autonomic disorders, unspecified

8D8B Disorders affecting autonomic synaptic neurotransmission

Coded Elsewhere: Aromatic L-amino acid decarboxylase deficiency (5C59.00)
Dopamine beta-hydroxylase deficiency (5C59.00)
Autosomal recessive dopa-responsive dystonia (8A02.11)
Menkes disease (5C64.0Y)

8D8C Autonomic dysreflexia

This is a potenitally dangerous disorder associated with damage to the spinal cord above the sixth thoracic level characterized by a marked increase in the sympathetic response to minor stimuli. It leads to sudden severe hypertension which can be life threatening

8D8D Hypoglycaemia unawareness

Hypoglycemia unawareness is defined at the onset of neuroglycopenia before the appearance of autonomic warning symptoms

8D8Y Other specified disorders of autonomic nervous system

8D8Z Disorders of autonomic nervous system, unspecified

Human prion diseases (8E00-8E0Z)

Human prion diseases or transmissible spongiform encephalopathies are rare transmissible diseases affecting the central nervous system. The infectious agents are composed of an abnormal isoform of a host membrane protein called 'prion protein' (PrP). Their common features are a long duration of incubation and lesions limited to the central nervous system without inflammatory or immunologic reaction but with accumulation of an abnormal form of prion protein (PrPsc).

8E00 Sporadic Creutzfeldt-Jakob Disease

A disease of the brain, that is associated with a mutation of normal prion protein genes or spontaneous transformation of prion proteins. This disease is characterised by a long incubation period, progressive dementia, neurological deficits, and is fatal. Transmission may be by direct contact with infected nervous tissue or blood. Confirmation is by pathological examination of the brain.

8E01 Acquired prion disease

Environmentally acquired prion diseases are prion diseases caused by a known source of abnormal prion protein.

8E01.0 Iatrogenically acquired Creutzfeldt-Jakob Disease

Iatrogenically acquired Creutzfeld-Jakob Disease (iCJD) is CJD acquired by medical procedures, medicines, medicinal materials, or devices.

8E01.1 Kuru

A disease of the nervous system, caused by a prion. This disease is characterised by limb pain, ataxia, tremors, decreased coordination, or emotional changes, and is fatal. Transmission is by ingestion of infected human brain, or direct contact. Confirmation is commonly by clinical signs, or pathological examination of the brain.

8E01.2 Variant Creutzfeldt-Jakob Disease

A disease of the brain, that is suspected to be caused by a prion associated with Bovine Spongiform Encephalopathy. This disease is characterised by a long incubation period, psychiatric symptoms followed by neurological deficits, and is fatal. Transmission may be by ingestion of food (with a bovine origin) contaminated with infected brain or spinal cord from an infected cow, or blood transfusion. Confirmation is by pathological examination of the brain.

8E01.3 Other acquired Creutzfeldt-Jakob Disease

There have been cases of Creutzfeldt-Jakob Disease (CJD) associated with neurosurgical procedures and stereotactic electroencephalogram (EEG) electrode placement on the brain, particularly in the 1950s to 1970s when the transmissibility of prions was not yet recognised.

8E02 Genetic prion diseases

8E02.0 Genetic Creutzfeldt-Jakob disease

A disease of the brain, that is associated with a prion. This disease is characterised by neurological deficits, and is fatal. Confirmation is by pathological examination of the brain.

8E02.1 Gerstmann-Straussler-Scheinker syndrome

A disease caused by inheritance of mutation(s) in normal prion protein genes. This disease is characterised by cerebellar ataxia, decreased coordination, dysmetria, or dysarthria, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.

Exclusions: Gerstmann syndrome (MB4C)

8E02.2 Fatal familial insomnia

A disease of the brain, caused by inheritance of mutation(s) of normal prion protein genes. This disease is characterised by severe insomnia and autonomic system dysfunction, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.

8E02.3 Other genetic prion diseases

8E02.Y Other specified Creutzfeldt-Jakob disease

8E02.Z Creutzfeldt-Jakob disease, unspecified

8E03 **Variably protease sensitive prionopathy**

A disease of the brain, caused by a mutation(s) in prion protein genes. This disease is characterised by deposition of abnormal prions in the brain leading to behavioural and mood changes, speech deficits, and progressive motor impairments. Confirmation is by pathological examination of the brain or identification of protease-sensitive prion proteins in a brain sample.

8E0Y **Other specified human prion diseases**

8E0Z **Human prion diseases, unspecified**

Disorders of consciousness (8E20-8E2Z)

Coded Elsewhere: Delirium (6D70)

Coma (MB20.1)

8E20 **Persistent vegetative state**

Subacute or chronic state of severe disturbance of consciousness lasting at least a month, characterised by the recovery of cyclic arousal states mimicking sleep/wake cycles after a severe brain injury. Patients with this condition are unresponsive and show no evidence of awareness of themselves or their environment. Cardiopulmonary and visceral autonomic regulation is maintained by the brainstem.

8E21 **Permanent vegetative state**

Prognostic term applied to patients in a persistent vegetative state for whom no recovery is expected.

8E22 **Minimally conscious state**

Subacute or chronic state of severely disturbed consciousness in which patients show minimal yet definite signs of consciousness, such as visual pursuit or command following, occurring after a severe brain injury. These patients do not show functional communication or functional use of objects.

8E22.0 Minimally conscious state plus

Subcategory of patients in a minimally conscious state who show signs of command following.

8E22.1 Minimally conscious state minus

Subcategory of patients in a minimally conscious state who show signs of non-reflex behaviour such as eye tracking, orientation to pain, or contingent responses to specific emotional stimuli but without command following.

8E22.Y Other specified minimally conscious state

8E22.Z Minimally conscious state, unspecified

8E2Y **Other specified disorders of consciousness**

8E2Z **Disorders of consciousness, unspecified**

Other disorders of the nervous system (8E40-8E4Y)

Coded Elsewhere: Brain death (MH10)

Neurosarcoidosis (4B20.3)

8E40 **Disorders of the meninges excluding infection**

Coded Elsewhere: Postprocedural meningitis (8E62)

8E40.0 Neoplastic meningitis

Inflammation of the meninges due to malignant infiltration from carcinomas, leukaemias and lymphomas. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia with potential progression to stupor and coma. The presentation may be acute, subacute or chronic. Diagnosis may be aided by neuroimaging and spinal fluid analysis which may reveal a lymphocytic pleocytosis, raised protein and the presence of malignant cells on cytology.

Coding Note: Code also the causing condition

8E40.1 Chemical meningitis

8E40.2 Inflammatory meningitis

A general term to describe a group of disorders in which there is Inflammation of the meninges due to an underlying inflammatory disorder. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia. Other central and peripheral nervous system manifestations may be present. Non-neurological features, including skin, eye and organ involvement may also be present. Diagnosis may be aided by serological testing, neuroimaging and if appropriate a tissue biopsy. Spinal fluid analysis may reveal a lymphocytic pleocytosis, a raised protein and the presence of oligoclonal bands.

8E40.3 **Arachnoiditis**

Arachnoiditis is a chronic inflammation of the arachnoid layer of the meninges, of which adhesive arachnoiditis is the most severe form, characterised by debilitating, intractable neurogenic back and limb pain and a range of other neurological problems.

8E40.Y **Other specified disorders of the meninges excluding infection**

8E40.Z **Disorders of the meninges excluding infection, unspecified**

8E41 Pachymeningitis

Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater which can be caused by chronic infection, inflammatory and immune-mediated disorders and malignancies. The cranial and/or the spinal dura may be affected. Neurological features includes headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances . Diagnosis may be aided by neuroimaging and spinal fluid analysis.

8E41.0 **Pachymeningitis due to infection**

Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater caused by chronic infection such as tuberculosis. The cranial and/or the spinal dura may be affected. Neurological features includes headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances . Diagnosis may be aided by neuroimaging, spinal fluid analysis and dural biopsy.

8E41.1 **Idiopathic hypertrophic pachymeningitis**

Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater for which no identifiable cause is found. The cranial and/or the spinal dura may be affected. Neurological features includes headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances . Diagnosis may be aided by neuroimaging and spinal fluid analysis and dural biopsy.

8E41.Y **Other specified pachymeningitis**

8E41.Z **Pachymeningitis, unspecified**

8E42 Superficial siderosis of the nervous system

Superficial siderosis is the deposition of haemosiderin in the central nervous system as a result of chronic or recurrent subarachnoid haemorrhage due to vascular anomalies, aneurysms, vascular tumours, neurosurgery, cervical root lesions, head injury and trauma. Clinical feature of Superficial siderosis include sensorineural deafness, cerebellar ataxia, pyramidal weakness and less frequently dementia, loss of sphincter control, anosmia, anisocoria, sensory disturbance, extra-ocular motor palsies, sciatica and lower motor neuron signs. The diagnosis may be confirmed by pure tone audiometry, neuroimaging, spinal fluid analysis, angiography to identify a potential bleeding source and where appropriate genetic testing.

8E43 Pain disorders

Exclusions: Chronic neuropathic pain (MG30.5)

8E43.0 Neuropathic pain

Neuropathic pain is described as electric, burning, or shock like, caused by metabolic, nutritional, infectious, genetic, autoimmune, and/or vasculitic processes. The pain may occur spontaneously, without provocation, or be provoked by noxious or nonnoxious stimuli. Pain is characteristic of small fibre neuropathy, but even in large fibre neuropathies, a sufficient number of small fibres may be damaged to cause pain. Neuropathic pain usually affects distal skin and subcutaneous structures. The pain may be constant or intermittent, and may be described as searing, burning, or icy cold.

Complex regional pain syndrome follows trauma and comprises regional pain, sensory changes, abnormalities of temperature, sudomotor activity, colour changes of the skin, and oedema.

Exclusions: Chronic neuropathic pain (MG30.5)

8E43.00 Phantom limb syndrome

Phantom limb pain is the perception of sensations, including pain, in a limb that has been amputated or a body part that has been removed. These sensations may include a specific position, shape, or movement of the phantom, feelings of warmth or cold, itching, tingling, or electric sensations, and other paraesthesias.

8E43.0Y Other specified neuropathic pain

8E43.0Z Neuropathic pain, unspecified

8E43.Y Other specified pain disorders

8E43.Z Pain disorders, unspecified

8E44 Post anoxic brain damage

Post anoxic brain damage refers to the variable severity of encephalopathy that results from circulatory arrest, hypotension or asphyxia.

8E45 Locked-in syndrome

8E46 Reye syndrome

Reye syndrome is sudden (acute) brain damage (encephalopathy) and liver function problems of unknown cause. The syndrome has occurred with the use of aspirin to treat chickenpox or the flu in children. However, it has become very uncommon since aspirin is no longer recommended for routine use in children. Reye syndrome often begins with vomiting, which lasts for many hours. The vomiting is quickly followed by irritable and aggressive behaviour. There is no specific treatment for this condition. The health care provider will monitor the pressure in the brain, blood gases, and blood acid-base balance (pH).

8E47 **Encephalopathy, not elsewhere classified**

Global brain dysfunction

Coding Note: Code also the causing condition

Coded Elsewhere: Neonatal encephalopathy (KB03)

8E48 **Encephalitis, not elsewhere classified**

8E49 **Postviral fatigue syndrome**

Inclusions: chronic fatigue syndrome

myalgic encephalomyelitis

Exclusions: Fatigue (MG22)

8E4A **Paraneoplastic or autoimmune disorders of the nervous system**

Paraneoplastic and autoimmune disorders of the nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelitis) or peripheral nervous systems (peripheral or autonomic neuropathies, neuromuscular junction disorders or myopathy). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

Coding Note: Code also the causing condition

8E4A.0 **Paraneoplastic or autoimmune disorders of the central nervous system, brain or spinal cord**

Paraneoplastic and autoimmune disorders of the central nervous system, brain and spinal cord nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelopathy, myelitis) nervous system. In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed 'autoimmune' the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the central nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

Coding Note: Code also the causing condition

Coded Elsewhere: Paraneoplastic retinopathy (9B71.4)

Autoimmune retinopathy (9B71.5)

Opsoclonus-myoclonus (9C85.02)

8E4A.1 **Paraneoplastic or autoimmune disorders of the peripheral or autonomic nervous system**

Paraneoplastic and autoimmune disorders of the peripheral and autonomic nervous system result from a targeted immune attack on neurons or glial cells in the peripheral nervous systems (peripheral or autonomic neuropathies). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. Onset may be subacute or insidious and these disorders may be limited, multifocal or generalised. Autoimmune somatic peripheral nerve disorders may affect the nerve at multiple levels including root, nerve and plexus and may be axonal, demyelinating or both. Autoimmune autonomic disorders result in autonomic failure that can be partial or generalised. The prototypic autonomic neuropathy is the autoimmune ganglionopathy associated with

antibodies targeting the ganglionic nicotinic acetylcholine receptor (α3 gAChR). Screening for cancer is appropriate for those with specific neural antibody profiles and other risk factors.

Associated neural antibodies in peripheral neuropathies include anti neuronal nuclear antibody type 1 or anti-Hu, CASPR2, gAChR, ganglioside (GM1 IgG and IGM) antibodies.

Coding Note: Code also the causing condition

8E4A.2 **Paraneoplastic or autoimmune neuromuscular transmission disorders**

NMT disorders are defined by a variable disturbance of the function of the neuromuscular transmission, resulting in fluctuating muscle weakness and fatigue. These are usually classified into pre- and postsynaptic disorders.

Presynaptic disorders, mainly the Lambert Eaton Myasthenic Syndrome (LEMS) is associated with antibodies targeting the voltage gated calcium channels (PQ and N type). LEMS is associated with malignancy (pulmonary or extra-pulmonary small cell carcinoma) in about 50 % of cases. In the context of LEMS the detection of SOX 1 (anti glial nuclear) antibodies is highly predictive of cancer.

Postsynaptically, myasthenia gravis is mostly (>90%) associated with antibodies targeting the muscle acetylcholine receptor (AChR) or rarely other proteins (including muscle -specific kinase -MUSK). Myasthenia is usually not considered a paraneoplastic disease, with the exception of thymoma in about 10% cases.

Coding Note: Code also the causing condition

Coded Elsewhere: Lambert-Eaton syndrome (8C62)

Myasthenia gravis (8C60)

8E4A.3 **Paraneoplastic or autoimmune disorders of the muscle**

Paraneoplastic and autoimmune diseases of muscle present with weakness and can be caused by a variety of causes, either by undefined remote effects or autoimmune effects in cancer, or autoimmune mechanisms in non cancer related conditions. The presentation is variable, usually presenting with a proximal myopathic pattern.

Coding Note: Code also the causing condition

8E4A.Y **Other specified paraneoplastic or autoimmune disorders of the nervous system**

Coding Note: Code also the causing condition

8E4Y **Other specified disorders of the nervous system**

Postprocedural disorders of the nervous system (8E60-8E66)

Coded Elsewhere: Anoxic-ischaemic encephalopathy (8B24.0)

Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

Post dural puncture headache (8A84.Y)

Dural graft-associated Creutzfeldt-Jakob Disease (8E01.0)

8E60 **Post ventricular shunting leak**

8E61 **Post radiation injury of the nervous system**

Coded Elsewhere: Post radiation lumbosacral plexopathy (8B92.0)

Post radiation polyneuropathy (8D43.21)

Post radiation brachial plexopathy (8B91.Y)

8E61.0 **Brain irradiation**

Injury to the brain from therapeutic cranial irradiation which may be divided temporally into three syndromes: Acute or early toxicity which is consequent upon immediate exposure to radiation, early-delayed injury and late-delayed injury although the three may overlap.

8E61.1 **Spinal cord irradiation**

8E62 **Postprocedural meningitis**

Inflammation of the meninges due to a procedure. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia. Diagnosis may be aided by neuroimaging and spinal fluid analysis which may reveal a lymphocytic pleocytosis and raised protein.

8E63 **Post pump encephalopathy**

8E64 **Multifocal cerebral infarctions**

8E66 **Intracranial hypotension due to lumbar puncture**

8E7Y **Other specified diseases of the nervous system**

8E7Z **Diseases of the nervous system, unspecified**

CHAPTER 09

Diseases of the visual system

This chapter has 160 four-character categories.

Code range starts with 9A00

This refers to any diseases of the visual system, which includes the eyes and adnexa, the visual pathways and brain areas, which initiate and control visual perception and visually guided behaviour.

Exclusions: Certain conditions originating in the perinatal period (Chapter 19)

Certain infectious or parasitic diseases (Chapter 01)

Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Endocrine, nutritional or metabolic diseases (Chapter 05)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Posterior cortical atrophy (8A21.0)

Coded Elsewhere: Neoplasms of the eye or ocular adnexa

Reasons for contact with the health care system in relation to eyes or vision

Contusion of eyeball or orbital tissues (NA06.9)

Foreign body in multiple parts of external eye (ND70.2)

Oculocutaneous albinism (EC23.20)

Traumatic injury to eyeball (NA06.8)

Birth injury to eye (KA41)

Late congenital syphilitic oculopathy (1A60.2)

Symptoms, signs or clinical findings of the visual system (MC10-MC2Y)

Structural developmental anomalies of the eye, eyelid or lacrimal apparatus (LA10-LA1Z)

This chapter contains the following top level blocks:

- Disorders of the ocular adnexa or orbit
- Disorders of the eyeball - anterior segment
- Disorders of the eyeball - posterior segment
- Disorders of the eyeball affecting both anterior and posterior segments
- Disorders of the visual pathways or centres
- Glaucoma or glaucoma suspect
- Strabismus or ocular motility disorders
- Disorders of refraction or accommodation
- Postprocedural disorders of eye or ocular adnexa

- Impairment of visual functions
- Vision impairment
- Neoplasms of the eye or ocular adnexa
- Reasons for contact with the health care system in relation to eyes or vision

Disorders of the ocular adnexa or orbit (9A00-9A4Z)

Coded Elsewhere: Ocular myiasis (1G01.0)

Disorders of eyelid or peri-ocular area (9A00-9A0Z)

Coded Elsewhere: Congenital malformations of the eyelid
Seborrhoeic keratosis (2F21.0)
Cysts of eyelid (2F36.4)
Eyelid trauma (NA06.0)
Benign cutaneous neoplasm or cyst of eyelid (2F36.Y)

9A00 **Congenital malposition of eyelids**

Coded Elsewhere: Congenital entropion (LA14.02)
Congenital ectropion (LA14.03)
Congenital ptosis (LA14.04)
Hypotelorism (LB71.0)
Hypertelorism (LB71.1)
Epiblepharon (LA14.0Y)

9A00.0 Dystopia canthorum

Coded Elsewhere: Waardenburg syndrome (EC23.2Y)

9A00.1 Telecanthus

9A00.Y Other specified congenital malposition of eyelids

9A00.Z Congenital malposition of eyelids, unspecified

9A01 **Infectious disorders of eyelid**

Coded Elsewhere: Trachoma (1C23)
Involvement of eyelid in tuberculosis (1B12.1)
Involvement of eyelid in leprosy (1B20.3)
Verruca vulgaris of eyelid (1E80.Y)

9A01.0 Preseptal cellulitis

9A01.1 Abscess of eyelid

9A01.2 **Hordeolum**

An acute focal infection usually by Staphylococcus aureus involving the eyelash follicle and its associated meibomian and Zeis glands. If the principal focus of infection is the follicle, it presents with a painful boil which discharges pus at the eyelid margin (external hordeolum or stye). If the infection is centred on the meibomian gland (internal hordeolum) then suppuration onto the conjunctival surface occurs.

9A01.20 Hordeolum externum

An acute focal pyogenic infection of the eyelash follicle commonly known as a stye and caused predominantly by Staphylococcus aureus. It presents as an acute painful inflammatory eyelid swelling which subsequently discharges at the eyelid margin.

9A01.21 Hordeolum internum

A focal acute pyogenic infection, usually by Staphylococcus aureus, of a meibomian gland, the normal secretion from which into the eyelash follicle is blocked. It presents as an acute inflammatory swelling which may discharge onto the conjunctival surface of the eyelid, or rarely anteriorly through the eyelid skin. It may predispose to formation of a chalazion.

Exclusions: Chalazion (9A02.0)

9A01.2Z Hordeolum, unspecified

9A01.3 **Infectious blepharitis**

A condition of the eyelid, commonly caused by an infection with a bacterial source. This condition is characterised by pruritus, burning, scratchiness, excessive tearing, or crusty debris around the eyelashes. This condition may also present with lid erythema, collarettes, madarosis, trichiasis, or plugged meibomian glands. Transmission is by direct or indirect contact with an infected individual, endogenous spread, or through fomites.

Exclusions: Blepharoconjunctivitis (9A60.4)

Coded Elsewhere: Herpes simplex infection of eyelid (1F00.11)

Molluscum contagiosum of eyelid (1E76)

Zoster infection of eyelid (1E91.1)

9A01.4 **Infestation of eyelid**

Coding Note: Code also the causing condition

Coded Elsewhere: Parasitic infestation of eyelid in loiasis (1F66.0)

Parasitic infestation of eyelid in leishmaniasis (1F54.Z)

9A01.Y **Other specified infectious disorders of eyelid**

9A02 Inflammatory disorders of eyelid

Coded Elsewhere: Atopic eczema of eyelids (9A06.70)

Seborrhoeic dermatitis of eyelids (9A06.71)

9A02.0 **Chalazion**

A chalazion is a small cyst on the eyelid caused by blockage of a meibomian gland.

9A02.00 Chalazion externum

9A02.01 Chalazion internum

9A02.0Y Other specified chalazion

9A02.0Z Chalazion, unspecified

9A02.1 **Posterior blepharitis**

Posterior blepharitis is inflammation of the eyelids secondary to dysfunction of the meibomian glands. Like anterior blepharitis it is a bilateral chronic condition and manifested by a broad spectrum of symptoms involving the lids including inflammation and plugging of the meibomian orifices and production of abnormal secretion upon pressure over the glands. It may be associated with skin rosacea.

9A02.2 **Ligneous conjunctivitis**

Ligneous conjunctivitis (LC) is a rare form of chronic conjunctivitis characterised by the recurrent formation of pseudomembranous lesions most commonly on the palpebral surfaces. It is most frequently reported as a clinical manifestation of severe homozygous or compound-heterozygous hypoplasminogenaemia. Most cases involve infants and children.

9A02.4 **Meibomian gland dysfunction**

This refers to the dysfunction of a special kind of sebaceous gland at the rim of the eyelids inside the tarsal plate, responsible for the supply of meibum, an oily substance that prevents evaporation of the eye's tear film. Meibum prevents tear spillage onto the cheek, trapping tears between the oiled edge and the eyeball, and makes the closed lids airtight.

9A02.Y **Other specified inflammatory disorders of eyelid**

9A03 Acquired malposition of eyelid

9A03.0 **Blepharoptosis**

Drooping of the upper lid due to deficient development or paralysis of the levator palpebrae muscle.

9A03.00 Marcus-Gunn syndrome

Marcus-Gunn syndrome is characterised by ptosis associated with maxillopalpebral synkinesis. The syndrome is generally unilateral and sporadic, but bilateral and autosomal dominant inherited cases have been reported.

9A03.01 Mechanical ptosis of eyelid

9A03.02 Myogenic ptosis of eyelid

This refers to a contraction initiated by the myocyte cell itself instead of an outside occurrence or stimulus such as nerve innervation, causing drooping or falling of the eyelid. The drooping may be worse after being awake longer, when the individual's muscles are tired.

9A03.03 Paralytic ptosis of eyelid

9A03.0Y Other specified blepharoptosis

9A03.0Z Blepharoptosis, unspecified

9A03.1 **Entropion of eyelid**

9A03.10 Cicatricial entropion of eyelid

9A03.11 Mechanical entropion of eyelid

9A03.12 Senile entropion of eyelid

This is a senile condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage).

9A03.13 Spastic entropion of eyelid

This is a spastic condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage).

9A03.1Y Other specified entropion of eyelid

9A03.1Z Entropion of eyelid, unspecified

9A03.2 **Ectropion of eyelid**

The turning outward (eversion) of the edge of the eyelid, resulting in the exposure of the palpebral conjunctiva.

9A03.20 Cicatricial ectropion of eyelid

9A03.21 Mechanical ectropion of eyelid

9A03.22 Senile ectropion of eyelid

9A03.23 Spastic ectropion of eyelid

9A03.24 Floppy eyelid syndrome

Acquired disorder of unknown origin, manifested by an easily everted floppy upper eyelid and papillary conjunctivitis of the upper palpebral conjunctiva. It is primarily associated with obese men and obstructive sleep apnoea. The tarsus of the upper eyelid becomes softer and looser probably due to mechanical forces and enzymatical changes. The upper eyelid everts during sleep, resulting in irritation, papillary conjunctivitis, and conjunctival keratinization. Effective treatment consists of preventing the upper eyelid from everting while the patient is sleeping.

9A03.2Y Other specified ectropion of eyelid

9A03.2Z Ectropion of eyelid, unspecified

9A03.3 Eyelid retraction

9A03.4 Lagophthalmos

9A03.40 Cicatricial lagophthalmos

9A03.41 Mechanical lagophthalmos

9A03.42 Paralytic lagophthalmos

9A03.4Y Other specified lagophthalmos

9A03.4Z Lagophthalmos, unspecified

9A03.5 Dermatochalasis of eyelid

9A03.Y Other specified acquired malposition of eyelid

9A03.Z Acquired malposition of eyelid, unspecified

9A04 Acquired disorders of eyelashes

Exclusions: Distichiasis (LA14.0)

Structural developmental anomalies of eyelids (LA14.0)

9A04.0 Trichiasis without entropion

This refers to abnormally positioned eyelashes that grow back toward the eye, touching the cornea or conjunctiva. This can be caused by infection, inflammation, autoimmune conditions, congenital defects, eyelid agenesis and trauma such as burns or eyelid injury. This diagnosis is without a condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it.

9A04.1 Madarosis of eyelid or periocular area

Partial or complete loss of eyelashes and/or eyebrow hairs. Alopecia areata and chronic cutaneous lupus erythematosus are well recognised causes. If the underlying cause is known this should be coded as well.

9A04.Y Other specified acquired disorders of eyelashes

9A05 Movement disorders of eyelid

Exclusions: Tic disorders (8A05)

Coded Elsewhere: Benign essential blepharospasm (8A02.00)

Hemifacial spasm (8B88.2)

Facial tic (8A05.03)

9A05.0 Myokymia of eyelid

Myokymia is used to describe an involuntary eyelid muscle contraction, typically involving the lower eyelid or less often the upper eyelid. It occurs in normal individuals and typically starts and disappears spontaneously. However, it can sometimes last up to three weeks. Since the condition typically resolves itself, medical professionals do not consider it to be serious or a cause for concern.

Exclusions: Facial myokymia (8B88.1)

Myokymia (MB47.5)

9A05.1 Eyelid apraxia

9A05.Y Other specified movement disorders of eyelid

9A05.Z Movement disorders of eyelid, unspecified

9A06 Certain specified disorders of eyelid

9A06.0 Involvement of eyelid by dermatosis classified elsewhere

Involvement of eyelid by skin diseases such as psoriasis or lichen planus.

9A06.1 Vitiligo of eyelid or periocular area

9A06.2 Symblepharon, acquired

9A06.3 Traumatic scar of eyelid

9A06.4 Xanthelasma of eyelid

Xanthelasmata are a form of plane xanthoma which manifest as sharply demarcated yellowish deposits of lipid within the skin of the eyelid. While they are neither harmful nor painful, these minor growths may be disfiguring and may be the presenting sign of hypercholesterolaemia. They are common in people of Asian origin and those from the Mediterranean region.

9A06.5 Tear Trough Deformity

9A06.6 Sunken Sulcus Deformity

9A06.7 Dermatitis or eczema of eyelids

Eczematous blepharitis and contact dermatitis affecting the eyelids.

Coded Elsewhere: Irritant contact blepharoconjunctivitis (EK02.11)

9A06.70 Atopic eczema of eyelids

Atopic eczema affecting the eyelids. This is a common manifestation of atopic eczema and can result in a significant impact on normal vision and on well-being.

9A06.71 Seborrhoeic dermatitis of eyelids

Seborrhoeic dermatitis of eyelids (seborrhoeic blepharitis) is common. It is characterised by redness and scaling on the skin of the eyelids with variable involvement of the eyelid margins.

Exclusions: Seborrhoea (ED91.2)

9A06.72 Allergic contact blepharoconjunctivitis

Allergic contact dermatitis affecting the eyelid and conjunctivae.

9A06.7Y Other specified dermatitis or eczema of eyelids

9A06.7Z Dermatitis or eczema of eyelids, type unspecified

9A06.8 Blepharochalasis

This is a malposition of the eyelid caused either by involution or by inflammation of the eyelid. The inflammation is characterised by exacerbations and remissions of eyelid oedema, which results in a stretching and subsequent atrophy of the eyelid tissue resulting in redundant folds over the lid margins. It typically affects only the upper eyelids, and may be unilateral as well as bilateral.

9A06.Y Other specified disorders of eyelid

9A0Y **Other specified disorders of eyelid or peri-ocular area**

9A0Z **Disorders of eyelid or peri-ocular area, unspecified**

Disorders of lacrimal apparatus (9A10-9A1Z)

Exclusions: congenital malformations of lacrimal system (LA14.1)

9A10 **Disorders of lacrimal gland**

9A10.0 Infections of the lacrimal gland

9A10.1 Orbital inflammatory syndrome

This refers to a marginated mass-like enhancing soft tissue involving any area of the orbit. It is the most common painful orbital mass in the adult population, and is associated with proptosis, cranial nerve palsy (Tolosa-Hunt syndrome), uveitis, and retinal detachment.

9A10.2 Benign lymphoepithelial lesion of lacrimal gland

This is a type of benign enlargement of the parotid and/or lacrimal glands. This pathologic state is sometimes, but not always, associated with Sjögren's syndrome. This diagnosis of paired almond-shaped glands, one for each eye, that secrete the aqueous layer of the tear film.

9A10.3 Hyperlacrimation

9A10.4 Underproduction of tears

Underproduction of tears causes keratoconjunctivitis sicca and can be caused by disorders that interrupt the neural control of lacrimation.

9A10.Y Other specified disorders of lacrimal gland

9A10.Z Disorders of lacrimal gland, unspecified

9A11 **Disorders of lacrimal drainage system**

Coded Elsewhere: Agenesis of lacrimal ducts (LA14.11)
Congenital dacryocele (LA14.12)
Congenital agenesis of lacrimal punctum (LA14.13)
Congenital stenosis or stricture of lacrimal duct (LA14.14)

9A11.0 Eversion of lacrimal punctum

Inclusions: Punctal ectropion

9A11.1 Canaliculitis

9A11.2 Dacryocystitis

9A11.3 Conjunctivochalasis

9A11.4 Punctal stenosis

9A11.5 Nasolacrimal canalicular stenosis

9A11.6 Dacryolith

9A11.7 Nasolacrimal sac stenosis

9A11.8 Nasolacrimal duct obstruction

Coded Elsewhere: Congenital stenosis or stricture of lacrimal duct (LA14.14)

9A11.Y Other specified disorders of lacrimal drainage system

9A11.Z Disorders of lacrimal drainage system, unspecified

9A1Y **Other specified disorders of lacrimal apparatus**

9A1Z **Disorders of lacrimal apparatus, unspecified**

Disorders of orbit (9A20-9A2Z)

This refers to disorders of the cavity or socket of the skull in which the eye and its appendages are situated. "Orbit" can refer to the bony socket, or it can also be used to imply the contents.

Coded Elsewhere: Neoplasms of orbit
Orbital trauma
Structural developmental anomalies of orbit (LA14.2)

9A20 **Displacement of eyeball**

9A20.0 Axial displacement of eyeball

9A20.00 Outward displacement of eyeball

Coding Note: Code also the causing condition

Inclusions: Proptosis
Exophthalmos

9A20.01 Inward displacement of eyeball

Inclusions: Enophthalmos

9A20.0Y Other specified axial displacement of eyeball

9A20.0Z Axial displacement of eyeball, unspecified

9A20.1 Non-Axial displacement of eyeball

9A20.Y Other specified displacement of eyeball

9A20.Z Displacement of eyeball, unspecified

9A21 Orbital infection

Coded Elsewhere: Osteomyelitis of orbit (FB84.Y)
Hydatic cyst (9A23.1)
Echinococcus infection of orbit (1F73.Y)
Myiasis of orbit (1G01.0)

9A21.0 Orbital cellulitis

Exclusions: Streptococcal cellulitis of skin (1B70.1)
Staphylococcal cellulitis of skin (1B70.2)

9A21.1 Orbital subperiosteal abscess

A condition of the eye and adnexa, caused by an infection with a bacterial source. This condition is characterised by a focal accumulation of purulent material in the bones that support the globe, fever, crusting of the eye, swelling of the eye, or proptosis. Confirmation is by identification of the bacterial agent.

9A21.2 Orbital abscess

9A21.3 Periostitis of orbit

9A21.Y Other specified orbital infection

9A21.Z Orbital infection, unspecified

9A22 Orbital inflammation

9A22.0 Dysthyroid orbitopathy

9A22.1 Diffuse orbital inflammation

9A22.2 Granulomatous orbital inflammation

9A22.Y Other specified orbital inflammation

9A22.Z Orbital inflammation, unspecified

9A23 Orbital cyst

9A23.0 **Congenital orbital cyst**

Coded Elsewhere: Teratoma of orbit (2F36.3)
Dermoid cyst of eyelid (2F36.4)

9A23.1 **Acquired orbital cyst**

Coded Elsewhere: Epidermoid cyst (EK70.0)

9A23.Z **Orbital cyst, unspecified**

9A24 Bony deformity of orbit

9A24.0 **Contraction of orbit**

9A24.1 **Expansion of orbit**

9A24.2 **Distortion of orbit**

9A24.3 **Enlargement of bony orbit**

9A24.4 **Exostosis of orbit**

9A24.Y **Other specified bony deformity of orbit**

9A24.Z **Bony deformity of orbit, unspecified**

9A25 Soft tissue deformity of orbit

9A25.0 **Anophthalmic socket**

9A25.1 **Microphthalmic socket**

9A25.2 **Contracted socket**

9A25.3 **Oedema of orbit**

9A25.4 **Haemorrhage of orbit**

This is the loss of blood or blood escaping from the circulatory system. This diagnosis is of the cavity or socket of the skull in which the eye and its appendages are situated. "Orbit" can refer to the bony socket, or it can also be used to imply the contents.

9A25.5 **Atrophy of soft tissue of orbit**

9A25.Y **Other specified soft tissue deformity of orbit**

9A25.Z **Soft tissue deformity of orbit, unspecified**

9A26 Combined bony and soft tissue deformity of orbit

Coded Elsewhere: Hypertelorism (LB71.1)

9A2Y Other specified disorders of orbit

9A2Z Disorders of orbit, unspecified

9A4Y **Other specified disorders of the ocular adnexa or orbit**

9A4Z **Disorders of the ocular adnexa or orbit, unspecified**

Disorders of the eyeball - anterior segment (9A60-9B3Z)

This refers to any disorders of the front third of the eye that includes the structures in front of the vitreous humour: the cornea, iris, ciliary body, and lens.

Coded Elsewhere: Structural disorders of the pupil (LA11.6)

Developmental anomalies of anterior segment (LA11.Y)

Disorders of conjunctiva (9A60-9A6Z)

This is a group of conditions associated with the conjunctiva which lines the inside of the eyelids and covers the sclera.

Coded Elsewhere: Neoplasms of conjunctiva

9A60 **Conjunctivitis**

Exclusions: keratoconjunctivitis (9A70-9A7Z)

Coded Elsewhere: Trachoma (1C23)

Viral conjunctivitis (1D84)

Neonatal conjunctivitis or dacryocystitis (KA65.0)

9A60.0 Papillary conjunctivitis

9A60.00 Giant papillary conjunctivitis

Giant papillary conjunctivitis is a nonallergic hypersensitivity inflammation of the ocular surface, most frequently to contact lenses, ocular prostheses, postoperative sutures, and scleral buckles.

9A60.01 Acute atopic conjunctivitis

This is the allergic inflammation of the conjunctiva (mucous membrane that covers the posterior surface of the eyelids and the anterior pericorneal surface of the eyeball) of the immediate type, due to airborne allergens such as pollens, dusts, spores, and animal hair.

9A60.02 Allergic conjunctivitis

Allergic conjunctivitis is an IgE-mediated response due to the exposure of seasonal or perennial allergens in sensitized patients. The allergen-induced inflammatory response of the conjunctiva results in the release of histamine and other mediators. Symptoms consist of redness (mainly due to vasodilation of the peripheral small blood vessels), oedema (swelling) of the conjunctiva, itching, and increased lacrimation (production of tears).

9A60.0Y Other specified papillary conjunctivitis

9A60.0Z Papillary conjunctivitis, unspecified

9A60.1 **Follicular conjunctivitis**

Coded Elsewhere: Chlamydial conjunctivitis (1C20)
Herpes simplex keratoconjunctivitis (1F00.1Y)
Zoster keratoconjunctivitis (1E91.1)
Keratoconjunctivitis due to adenovirus (1D84.0)
Keratoconjunctivitis due to Acanthamoeba (1F50)

9A60.2 **Cicatrizing conjunctivitis**

9A60.3 **Mucopurulent conjunctivitis**

These are infections of the conjunctiva, containing mucus and pus, by several species such as Haemophilus, Streptococcus, Neisseria, and Chlamydia.

9A60.30 Ulceration of conjunctiva

9A60.31 Abscess of conjunctiva

9A60.32 Conjunctivitis due to Koch-Weeks bacillus

9A60.33 Acute epidemic conjunctivitis

9A60.3Y Other specified mucopurulent conjunctivitis

9A60.3Z Mucopurulent conjunctivitis, unspecified

9A60.4 **Blepharoconjunctivitis**

9A60.5 **Vernal keratoconjunctivitis**

Vernal keratoconjunctivitis is a persistent and severe form of ocular allergy that affects children and young adults, usually in warm climates. Vernal keratoconjunctivitis typically appears in boys between the ages of 4–12 years. The typical symptoms are intense itching, tearing, and photophobia. Disease exacerbation can be triggered either by allergen re-exposure or by nonspecific stimuli such as sunlight, wind, and dust. The tarsal form is characterised by irregularly sized hypertrophic papillae, leading to a cobblestone appearance of the upper tarsal plate. The limbal form is characterised by transient, multiple limbal, or conjunctival gelatinous yellow-grey infiltrates superposed with white points or deposits, known as Horner–Trantas dots and papillae at the limbus.

9A60.6 **Serous conjunctivitis, except viral**

9A60.Y **Other specified conjunctivitis**

9A60.Z **Conjunctivitis, unspecified**

9A61 Certain specified disorders of conjunctiva

Exclusions: keratoconjunctivitis (9A70-9A7Z)

Coded Elsewhere: Conjunctival blebitis after glaucoma surgery (9D23)

Complications with glaucoma drainage devices (9D24)

Injury of conjunctiva or corneal abrasion without mention of foreign body (NA06.4)

Foreign body in conjunctival sac (ND70.1)

9A61.0 Pingueculae

9A61.1 Pterygium

Exclusions: Pseudopterygium of conjunctiva (9A61.2)

9A61.2 Pseudopterygium of conjunctiva

9A61.3 Conjunctival scars

These are cicatrices of the mucous membrane that lines the inner surface of the eyelid and the exposed surface of the eyeball that occur due to various reasons such as trauma, infection or allergy.

9A61.4 Conjunctival vascular disorders

Benign cysts which often appear as small, clear, fluid-filled inclusions of conjunctival epithelium whose goblet cells secrete into the cyst and not onto the surface.

9A61.40 Vascular abnormalities of conjunctiva

Coded Elsewhere: Conjunctival haemangioma or haemolymphangioma (2E81.01)

9A61.4Y Other specified conjunctival vascular disorders

9A61.4Z Conjunctival vascular disorders, unspecified

9A61.5 Conjunctival or subconjunctival haemorrhage

A conjunctival haemorrhage is a small haematoma clearly delimited on the conjunctiva itself resulting from a direct blow on the eye. Subconjunctival haemorrhage extends from the orbit, forward and deep to the conjunctiva with no posterior limit.

9A61.6 Conjunctival or subconjunctival degenerations or deposits

These are the conjunctival/subconjunctival accumulation of some materials and gradual deterioration with impairment or loss of function, caused by injury, disease, or aging.

Coded Elsewhere: Vitamin A deficiency with conjunctival xerosis (5B55.1)

Vitamin A deficiency with conjunctival xerosis and Bitot's spots (5B55.2)

9A61.Z Certain specified disorders of conjunctiva, unspecified

9A62 **Mucous membrane pemphigoid with ocular involvement**

Mucous membrane pemphigoid (MMP) involving the conjunctivae is also known as ocular pemphigoid. This may be confined to the conjunctivae or may be associated with involvement of other sites as well. Its importance lies in its potential to cause loss of vision and it may thus warrant more aggressive therapy than would be considered for MMP of other sites.

Coded Elsewhere: Chronic cicatrizing conjunctivitis, ocular cicatricial pemphigoid (9A60.2)

9A6Y **Other specified disorders of conjunctiva**

9A6Z **Disorders of conjunctiva, unspecified**

Disorders of the cornea (9A70-9A7Z)

This refers to disorders of the transparent front part of the eye that covers the iris, pupil, and anterior chamber. The cornea, with the anterior chamber and lens, refracts light, with the cornea accounting for approximately two-thirds of the eye's total optical power.

Coded Elsewhere: Neoplasms of the cornea

9A70 **Hereditary corneal dystrophies**

The term corneal dystrophy embraces a heterogeneous group of bilateral genetically determined non-inflammatory corneal diseases that are usually restricted to the cornea. The designation is imprecise but remains in vogue because of its clinical value.

Coded Elsewhere: X-linked ichthyosis (EC20.01)

Cornea plana (LA11.1)

Megalocornea (LA11.1)

Microcornea (LA11.1)

9A70.0 Endothelial corneal dystrophy

9A70.Y Other specified hereditary corneal dystrophies

9A70.Z Hereditary corneal dystrophies, unspecified

9A71 **Infectious keratitis**

Coded Elsewhere: Herpes simplex keratitis (1F00.10)

9A72 **Traumatic keratitis**

Exclusions: Foreign body in cornea (ND70.0)

9A73 **Exposure keratitis**

This is an exposure condition in which the eye's cornea, the front part of the eye, becomes inflamed. The condition is often marked by moderate to intense pain and usually involves impaired eyesight. May cause feelings of scratching each time individual blinks eye.

9A74 Neurotrophic keratitis

Coding Note: Code also the causing condition

9A75 Autoimmune keratitis

9A76 Corneal ulcer

Loss of epithelial tissue from the surface of the cornea due to progressive erosion and necrosis of the tissue. It is often caused by bacterial, fungal, or viral infection.

9A77 Corneal scars or opacities

Corneal opacity occurs when the cornea is scarred by a variety of infectious and inflammatory eye diseases. These scars stop light from passing through the cornea to the retina and may cause the cornea which is normally transparent to appear white or clouded over.

Coded Elsewhere: Anterior corneal pigmentations (9A78.1)

Posterior corneal pigmentations (9A78.1)

Stromal corneal pigmentations (9A78.1)

9A77.0 Contact lens-associated corneal infiltrates

9A77.1 Adherent leukoma

This is a white tumour of the cornea enclosing a prolapsed adherent iris.

9A77.Y Other specified corneal scars or opacities

9A77.Z Corneal scars or opacities, unspecified

9A78 Certain specified disorders of cornea

Coded Elsewhere: Injury of conjunctiva or corneal abrasion without mention of foreign body (NA06.4)

Ocular laceration or rupture with prolapse or loss of intraocular tissue, unilateral (NA06.87)

Ocular laceration without prolapse or loss of intraocular tissue, unilateral (NA06.8D)

Ocular laceration or rupture with prolapse or loss of intraocular tissue, bilateral (NA06.88)

Ocular laceration without prolapse or loss of intraocular tissue, bilateral (NA06.8E)

Foreign body in cornea (ND70.0)

Chemical burn of cornea or conjunctival sac (NE00)

9A78.0 Corneal neovascularization

9A78.1 Corneal pigmentations or deposits

9A78.2 Corneal oedema

9A78.20 Bullous keratopathy

This is the maximum stage of corneal oedema.

It is a pathological condition in which small vesicles, or bullae, are formed in the cornea due to endothelial dysfunction. In a healthy cornea, endothelial cells keeps the tissue from excess fluid absorption, pumping it back into the aqueous humour. When affected by some reason, such as Fuchs' dystrophy or a trauma during cataract removal, endothelial cells suffer mortality or damage. The corneal endothelial cells normally do not undergo mitotic cell division, and cell loss results in permanent loss of function.

9A78.21 Secondary corneal oedema

9A78.2Y Other specified corneal oedema

9A78.2Z Corneal oedema, unspecified

9A78.3 **Changes in corneal membranes**

9A78.4 **Corneal degeneration**

Exclusions: Mooren ulcer (9A76)

Coded Elsewhere: Vitamin A deficiency with corneal xerosis (5B55.3)

Vitamin A deficiency with corneal ulceration or keratomalacia (5B55.4)

Vitamin A deficiency with xerophthalmic scars of cornea or blindness (5B55.5)

9A78.5 **Corneal deformities**

Coded Elsewhere: Structural developmental anomalies of cornea (LA11.1)

9A78.50 Keratoconus

Keratoconus is a noninflammatory, often bilateral, corneal dystrophy characterised by progressive cone-shaped bulging and thinning of the cornea.

Coding Note: Code also the causing condition

9A78.51 Corneal staphyloma

9A78.5Y Other specified corneal deformities

9A78.5Z Corneal deformities, unspecified

9A78.6 **Anaesthesia of cornea**

This is the condition of having sensation (including the feeling of pain) blocked or temporarily taken away, of the transparent front part of the eye that covers the iris, pupil, and anterior chamber.

9A78.7 **Hypoesthesia of cornea**

This refers to a reduced sense of touch or sensation, or a partial loss of sensitivity to sensory stimuli, of the transparent front part of the eye that covers the iris, pupil, and anterior chamber.

9A78.8 **Recurrent erosion of cornea**

9A78.9 **Corneal abscess**

9A78.A **Sclerosing keratitis**

9A78.Z **Certain specified disorders of cornea, unspecified**

9A79 **Keratoconjunctivitis sicca**

9A7Y **Other specified disorders of the cornea**

9A7Z **Disorders of the cornea, unspecified**

Disorders of the anterior chamber (9A80-9A8Z)

Coded Elsewhere: Retained foreign body in anterior chamber of eye (NA06.2)

9A80 **Hyphaema**

Exclusions: traumatic hyphaema (NA06.9)

9A81 **Parasites in the anterior chamber of the eye**

Coding Note: Code also the causing condition

9A82 **Cyst in the anterior chamber of the eye**

9A83 **Flat anterior chamber hypotony of eye**

9A8Y **Other specified disorders of the anterior chamber**

9A8Z **Disorders of the anterior chamber, unspecified**

Disorders of the anterior uvea (9A90-9A9Z)

Coded Elsewhere: Congenital malformations of the uvea

Neoplasms of the iris

Neoplasms of the ciliary body

Corectopia (LA11.Y)

Polycoria (LA11.Y)

Atresia iridis (LA11.Y)

9A90 **Degeneration of iris or ciliary body**

9A90.0 **Disorders of chamber angle**

This refers to the change of tissue to a lower or less functionally active form, of the fluid-filled space inside the eye between the iris and the cornea's innermost surface, the endothelium.

9A90.1 **Degeneration of iris**

This refers to the change of tissue to a lower or less functionally active form, of the thin, circular structure in the eye, responsible for controlling the diameter and size of the pupil and thus the amount of light reaching the retina. The color of the iris is often referred to as "eye color."

9A90.2 **Iris atrophy**

9A90.Y **Other specified degeneration of iris or ciliary body**

9A90.Z **Degeneration of iris or ciliary body, unspecified**

9A91 Cyst of iris or ciliary body

9A92 Persistent pupillary membranes

9A93 Adhesions or disruptions of iris or ciliary body

This refers to adhesions and disruptions of the thin, circular structure in the eye, responsible for controlling the diameter and size of the pupil and thus the amount of light reaching the retina. The colour of the iris is often referred to as "eye colour." It is also of the circumferential tissue inside the eye composed of the ciliary muscle and ciliary processes. It is triangular in horizontal section and is coated by a double layer, the ciliary epithelium.

Exclusions: Corectopia (LA11)

9A94 Certain specified disorders of iris or ciliary body

9A94.0 **Rubeosis of iris**

9A94.1 **Floppy iris syndrome**

This is a complication that may occur during cataract extraction in certain patients. This syndrome is characterised by a flaccid iris which billows in response to ordinary intraocular fluid currents, a propensity for this floppy iris to prolapse towards the area of cataract extraction during surgery, and progressive intraoperative pupil constriction despite standard procedures to prevent this.

9A94.2 **Plateau iris syndrome**

9A94.Y **Other disorders of iris and ciliary body**

9A96 Anterior uveitis

Coding Note: Code also the causing condition

9A96.0 **Anterior uveitis not associated with systemic conditions**

9A96.1 **Anterior uveitis associated with systemic conditions**

Coding Note: Code also the causing condition

Coded Elsewhere: Sarcoid associated anterior uveitis (4B20.4)

9A96.2 **Infection-associated anterior uveitis**

Coding Note: Code also the causing condition

Coded Elsewhere: Gonococcal anterior uveitis (1A72.4)
Zoster anterior uveitis (1E91.1)
Secondary syphilitic anterior uveitis (1A61.4)
Tuberculous anterior uveitis (1B12.1)
Chronic tuberculous iridocyclitis (1B12.1)
Syphilitic uveitis (1A62.20)

9A96.3 **Primary anterior uveitis**

This refers to primary inflammation of the uvea. The uvea consists of the middle, pigmented, vascular structures of the eye and includes the iris, ciliary body, and choroid.

9A96.Y **Other specified anterior uveitis**

Coding Note: Code also the causing condition

9A96.Z **Anterior uveitis, unspecified**

Coding Note: Code also the causing condition

9A9Y **Other specified disorders of the anterior uvea**

9A9Z **Disorders of the anterior uvea, unspecified**

Functional disorders of the pupil (9B00-9B0Z)

9B00 **Disorders of the afferent pupillary system**

9B00.0 **Relative afferent pupillary defects**

9B00.1 **Amaurotic pupillary reaction**

9B00.2 **Paradoxical pupillary reaction to light or darkness**

9B00.3 **Wernicke pupils**

9B00.Y **Other specified disorders of the afferent pupillary system**

9B00.Z **Disorders of the afferent pupillary system, unspecified**

9B01 **Disorders of the efferent pupillary system**

Coded Elsewhere: Horner syndrome (8D8A.1)
Horner syndrome, acquired (8D8A.1)
Horner syndrome, congenital (8D8A.1)

9B01.0 **Physiologic anisocoria**

9B01.1 **Parasympathoparetic pupils**

Damage to the parasympathetic outflow to the iris sphincter muscle

Coded Elsewhere: Third nerve palsy (9C81.0)

9B01.2 **Pharmacologic inhibition of the parasympathetic pathway**

9B01.3 **Iris sphincter disorders**

This refers to disorders of the muscle in the part of the eye called the iris. It encircles the pupil of the iris, appropriate to its function as a constrictor of the pupil.

9B01.4 **Pharmacologic parasympathicotonic pupils**

Pharmacologic stimulation of the parasympathetic pathway

9B01.5 **Pharmacologic sympathoparetic pupils**

9B01.6 **Sympathotonic pupils**

9B01.7 **Episodic unilateral mydriasis**

9B01.Y **Other specified disorders of the efferent pupillary system**

9B01.Z **Disorders of the efferent pupillary system, unspecified**

9B02 Light-near dissociations

9B02.0 **Argyll Robertson pupil**

These are bilateral small pupils that constrict when the patient focuses on a near object but do not constrict when exposed to bright light (they do not "react" to light).

Coding Note: Code also the causing condition

Coded Elsewhere: Syphilitic Argyll Robertson pupil (1A62.01)

9B02.1 **Pregeniculate light-near dissociations**

9B02.2 **Mesencephalic light-near dissociations**

9B02.Y **Other specified light-near dissociations**

9B02.Z **Light-near dissociations, unspecified**

9B0Y Other specified functional disorders of the pupil

9B0Z Functional disorders of the pupil, unspecified

Disorders of lens (9B10-9B1Z)

Coded Elsewhere: Structural developmental anomalies of lens or zonula (LA12)

Presence of intraocular lens (QB51.2)

9B10 Cataract

9B10.0 **Age-related cataract**

A senile cataract is a clouding of the lens of the eye, which impedes the passage of light, related to ageing, and that occurs usually starting from the age of 40.

Exclusions: capsular glaucoma with pseudoexfoliation of lens (9C61.0)

9B10.00 Coronary age-related cataract

9B10.01 Punctate age-related cataract

9B10.02 Mature age-related cataract

This is a mature age-related clouding of the lens inside the eye which leads to a decrease in vision. It is the most common cause of blindness and is conventionally treated with surgery. Visual loss occurs because opacification of the lens obstructs light from passing and being focused on to the retina at the back of the eye.

9B10.0Y Other specified age-related cataract

9B10.0Z Age-related cataract, unspecified

9B10.1 **Infantile or juvenile cataract**

A cataract is clouding of the lens of the eye, which impedes the passage of light.

Exclusions: Congenital cataract (LA12.1)

9B10.10 Combined forms of infantile and juvenile cataract

9B10.1Y Other specified infantile or juvenile cataract

9B10.1Z Infantile or juvenile cataract, unspecified

9B10.2 **Certain specified cataracts**

A cataract is clouding of the lens of the eye, which impedes the passage of light.

Coding Note: Code also the causing condition

Exclusions: Congenital cataract (LA12.1)

Coded Elsewhere: Myotonic cataract (9B10.2Y)

Undernutrition-dehydration cataract (9B10.2Y)

9B10.20 Traumatic cataract

Partial or complete opacity on or in the lens or capsule of one or both eyes, impairing vision or causing blindness. The many kinds of cataract are classified by their morphology (size, shape, location) or etiology (cause and time of occurrence) resulting from or following injury.

9B10.21 Diabetic cataract

This refers to an unspecified group of metabolic diseases in which a person has high blood sugar, either because the pancreas does not produce enough insulin, or because cells do not respond to the insulin that is produced. This diagnosis is with diabetic cataract.

Coding Note: Always assign an additional code for diabetes mellitus.

9B10.22 After-cataract

This is a clouding of the lens of the eye, which impedes the passage of light resulting from disease, degeneration, or from surgery.

Inclusions: Secondary cataract

Soemmerring ring

9B10.23 Subcapsular glaucomatous flecks

Coding Note: Code also the causing condition

9B10.2Y Other specified cataracts

Coding Note: Code also the causing condition

9B10.Z **Cataract, unspecified**

9B11 **Certain specified disorders of lens**

Exclusions: congenital lens malformations (LA12)

Cataract lens fragments in eye following cataract surgery (9D21)

Coded Elsewhere: Presence of intraocular lens (QB51.2)

9B11.0 Aphakia

9B11.1 Dislocation of lens

9B11.Y Other disorders of lens

9B1Z **Disorders of lens, unspecified**

9B3Y **Other specified disorders of the eyeball - anterior segment**

9B3Z **Disorders of the eyeball - anterior segment, unspecified**

Disorders of the eyeball - posterior segment (9B50-9C0Z)

This refers to disorders of the back two-thirds of the eye that includes the anterior hyaloid membrane and all of the optical structures behind it: the vitreous humour, retina, choroid, and optic nerve.

Disorders of sclera (9B50-9B5Z)

Coded Elsewhere: Blue sclera (LA11.0)

9B50 **Episcleritis**

Episcleritis is a benign, self-limiting inflammatory disease affecting part of the eye called the episclera. The episclera is a thin layer of tissue that lies between the conjunctiva and the connective tissue layer that forms the white of the eye (sclera). Episcleritis is a common condition, and is characterised by the abrupt onset of mild eye pain and redness.

Coded Elsewhere: Tuberculous episcleritis (1B12.1)

Late syphilitic episcleritis (1A62.20)

9B51 **Scleritis**

Inflammation of the white, opaque, fibrous, outer tunic of the eyeball. Can be associated with uveitis.

Coded Elsewhere: Zoster scleritis (1E91.1)

9B52 **Scleral staphyloma**

Exclusions: degenerative myopia (9B76)

9B5Y **Other specified disorders of sclera**

9B5Z **Disorders of sclera, unspecified**

Disorders of the choroid (9B60-9B6Z)

Inclusions: Disorders of posterior uvea

Coded Elsewhere: Neoplasms of choroid

Congenital malformations of choroid (LA13.6)

9B60 **Choroidal degeneration**

Exclusions: angioid streaks (9B78.3)

9B61 **Choroidal dystrophy**

Exclusions: ornithinaemia (5C50.9)

9B62 **Chorioretinal scars**

9B63 **Choroidal haemorrhage or rupture**

Coded Elsewhere: Choroidal rupture (NA06.61)

9B64 **Choroidal detachment**

9B65 **Choroiditis**

Inclusions: Posterior uveitis

9B65.0 Noninfectious posterior choroiditis

Coded Elsewhere: Ocular Behçet disease (4A62)

9B65.1 Infectious posterior choroiditis

Coding Note: Code also the causing condition

Coded Elsewhere: Late syphilitic posterior uveitis (1A62.20)

Toxoplasma posterior uveitis (1F57.3)

Tuberculous posterior uveitis (1B12.1)

9B65.2 Chorioretinal inflammation

Coded Elsewhere: Toxoplasma chorioretinitis (1F57.3)

Tuberculous chorioretinitis (1B12.1)

Late congenital syphilitic chorioretinitis (1A60.2)

9B65.Z Choroiditis, unspecified

9B66 **Intermediate choroiditis**

This is a form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

9B66.0 **Noninfectious intermediate choroiditis**

This is a non-infectious form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

9B66.1 **Infectious intermediate choroiditis**

This is a infectious form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

9B66.Z **Intermediate choroiditis, unspecified**

9B6Y Other specified disorders of the choroid

9B6Z Disorders of the choroid, unspecified

Disorders of the retina (9B70-9B7Z)

Coded Elsewhere: Certain congenital malformations of posterior segment of eye (LA13.8)

Neoplasms of retina

Traumatic injuries of the retina (NA06.6)

Renal retinitis in chronic kidney disease, stage 5 (GB61.5)

Presence of retina Implant (QB51.Y)

Coats disease (LD21.Y)

9B70 Inherited retinal dystrophies

Coded Elsewhere: Sjögren-Larsson syndrome (5C52.03)

Usher syndrome (LD2H.4)

Asphyxiating thoracic dystrophy (LD24.B1)

9B71 Retinopathy

Coding Note: Code also the causing condition

9B71.0 **Diabetic retinopathy**

A condition characterised as a disease of the retina (retinopathy) involving damage to the small blood vessels in the retina which is due to chronically high blood glucose levels in people with diabetes.

Coding Note: Always assign an additional code for diabetes mellitus.

9B71.00 Nonproliferative diabetic retinopathy

Coding Note: Code also the causing condition

9B71.01 Proliferative diabetic retinopathy

This is proliferative retinopathy (damage to the retina) caused by complications of diabetes, which can eventually lead to blindness. It is an ocular manifestation of diabetes, a systemic disease, which affects up to 80 percent of all patients who have had diabetes for 10 years or more.

Always assign an additional code for the type of diabetes mellitus.

Coding Note: Code also the causing condition

9B71.02 Diabetic macular oedema

Coding Note: Code also the causing condition

9B71.0Z Diabetic retinopathy, unspecified

Coding Note: Always assign an additional code for diabetes mellitus.

9B71.1 Hypertensive retinopathy

Coding Note: Code also the causing condition

9B71.2 Radiation retinopathy

Radiation retinopathy is damage to retina due to exposure to ionizing radiation. Radiation retinopathy has a delayed onset, typically after months or years of radiation, and is slowly progressive. In general, radiation retinopathy is seen around 18 months after treatment with external-beam radiation and with brachytherapy.

9B71.3 Retinopathy of prematurity

Retinopathy of prematurity is a vasoproliferative disorder that affects extremely premature infants potentially leading to severe visual impairment or blindness. Exposure of newborn premature infants to hyperoxia down regulates retinal vascular endothelial growth factor, Blood vessels constrict and can become obliterated, resulting in delays of normal retinal vascular development. Low birth weight, young gestational age, and severity of illness (e.g. respiratory distress syndrome, bronchopulmonary dysplasia, sepsis) are associated factors. It primarily occurs in extremely low birth weight infants because of the cessation of normal retinal vascular maturation.

Coding Note: Code also the causing condition

Inclusions: Retrolental fibroplasia

9B71.4 **Paraneoplastic retinopathy**

Paraneoplastic retinopathies results from a targeted attack on the retina due to a tumour immune response initiated by onco-neural antigens derived from systemic cancer. Patients usually present after cancer diagnosis with progressive visual dimming and photopsias but dysfunction of rods (impaired dark adaption and peripheral vision loss) and cones (decreased visual acuity, colour dysfunction, photosensitivity and glare) may also occur. Symptoms are often worse than clinical signs. Other causes of retinopathy should be excluded. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Two major subsets are recognised: cancer-associated-retinopathy (most commonly small-cell-lung-cancer) and melanoma-associated-retinopathy.

Associated neural autoantibodies include:

CRMP5 (anti-CV2) (collapsin response mediator protein 5 - anti CV2); anti-recoverin autoantibodies; and alpha-enolase autoantibodies.

Coding Note: Code also the causing condition

9B71.40 Melanoma associated retinopathy

9B71.4Y Other specified paraneoplastic retinopathy

Coding Note: Code also the causing condition

9B71.4Z Paraneoplastic retinopathy, unspecified

Coding Note: Code also the causing condition

9B71.5 **Autoimmune retinopathy**

Autoimmune retinopathies are immune-mediated inflammatory disorders of the retina that differ from paraneoplastic retinopathies in the lack of association with cancer. Patients present with progressive visual loss and dysfunction of rods (impaired dark adaption and peripheral vision problems) and cones (visual acuity, colour dysfunction, photosensitivity and glare) may occur. The symptoms are often worse than the clinical signs on fundoscopy. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Autoimmune retinopathy is a diagnosis of exclusion and other causes of retinopathy need to be ruled out, while the potential role of immunotherapy remains uncertain.

Associated neural autoantibodies include:

anti-recoverin autoantibodies; alpha-enolase autoantibodies; anti-transducin autoantibodies;

Coding Note: Code also the causing condition

9B71.Y **Other specified retinopathy**

Coding Note: Code also the causing condition

9B71.Z **Retinopathy, unspecified**

Coding Note: Code also the causing condition

9B72 Inflammatory diseases of the retina

This refers to inflammatory diseases of light-sensitive layer of tissue, lining the inner surface of the eye. The optics of the eye create an image of the visual world on the retina, which serves much the same function as the film in a camera.

Coded Elsewhere: Retinal vasculitis (9B78.12)

9B72.0 Viral retinitis

9B72.00 Cytomegaloviral retinitis

This is an inflammation of the eye's retina that can lead to blindness. This is a DNA virus in the family Herpesviridae known for producing large cells with nuclear and cytoplasmic inclusions. Such inclusions are called an "owl's eye" effect.

9B72.01 HIV retinitis

9B72.0Y Other specified viral retinitis

9B72.0Z Viral retinitis, unspecified

9B72.Y Other specified inflammatory diseases of the retina

9B72.Z Inflammatory diseases of the retina, unspecified

9B73 Retinal detachments or breaks

Retinal breaks are full thickness openings in the neurosensory retina that can be in the form of a hole, a tear or a retinal dialysis. Retinal detachment is a condition in which the retina peels away from its underlying layer of support tissue.

Exclusions: detachment of retinal pigment epithelium (9B78.6)

9B73.0 Retinal detachment with retinal break

Inclusions: Rhegmatogenous retinal detachment

9B73.1 Retinoschisis

9B73.10 Adult retinoschisis

9B73.11 Juvenile retinoschisis

X-linked retinoschisis is a genetic ocular disease that is characterised by reduced visual acuity in males due to juvenile macular degeneration.

9B73.1Y Other specified retinoschisis

9B73.1Z Retinoschisis, unspecified

9B73.2 Retinal cysts

Retinoschisis is an eye disease characterised by the abnormal splitting of the retina's neurosensory layers. A retinal cyst is a closed sac, having a distinct membrane and division compared to the nearby tissue in retina that can either be congenital or acquired.

Exclusions: congenital retinoschisis (LA13.3)

Microcystoid degeneration of retina (9B78.4)

9B73.3 **Serous retinal detachment**

This occurs due to inflammation, injury or vascular abnormalities that results in fluid accumulating underneath the retina without the presence of a hole, tear, or break.

Exclusions: Central serous chorioretinopathy (9B75.2)

9B73.4 **Retinal breaks without detachment**

Exclusions: Chorioretinal scars after surgery for detachment (9D22)

peripheral retinal degeneration without break (9B78.4)

9B73.Y **Other specified retinal detachments or breaks**

9B73.Z **Retinal detachments or breaks, unspecified**

9B74 Retinal vascular occlusions

These are obstruction or closure of retinal vascular structures.

Exclusions: amaurosis fugax (9D51)

9B74.0 **Retinal artery occlusions**

9B74.1 **Retinal venous occlusions**

9B74.2 **Combined retinal arterial and vein occlusion**

9B74.Y **Other specified retinal vascular occlusions**

9B74.Z **Retinal vascular occlusions, unspecified**

9B75 Macular disorders

9B75.0 **Age-related macular degeneration**

Age-related macular degeneration (ARMD) is defined as an ocular disease leading to loss of central vision in the elderly, and characterised by primary and secondary damage of macular retinal pigment epithelial (RPE) cells, resulting in formation of drusen (deposits lying beneath the RPE), choroidal neovascularization (CNV), and atrophy of photoreceptors and choriocapillaris layer of the choroidea.

Coded Elsewhere: Small drusen of the macula (MC20.1)

9B75.00 Early age-related macular degeneration

consists of a combination of multiple small drusen, few intermediate drusen (63 to 124 microns in diameter), or RPE abnormalities.

9B75.01 Intermediate age-related macular degeneration

consists of extensive intermediate drusen, at least one large druse (>=125 microns in diameter), or geographic atrophy not involving the centre of the fovea

9B75.03 Atrophic late-stage age-related macular degeneration

9B75.04 Neovascular late-stage age-related macular degeneration

9B75.0Y Other specified age-related macular degeneration

9B75.0Z Age-related macular degeneration, unspecified

9B75.1 **Non-traumatic macular hole**

9B75.2 **Central serous chorioretinopathy**

This is an eye disease which causes visual impairment, often temporary, usually in one eye. When the disorder is active it is characterised by leakage of fluid under the retina that has a propensity to accumulate under the central macula.

9B75.3 **Macular telangiectasia**

9B75.Y **Other specified macular disorders**

9B75.Z **Macular disorders, unspecified**

9B76 Degenerative high myopia

Macular lesions occurring in people with myopia, usually high myopia, causing a decrease of the best corrected visual acuity and comprising myopic chorioretinal atrophy, myopic choroidal neovascularization and myopic retinoschisis

9B77 Eales disease

Eales disease is a retinal vasculopathy that presents as an inflammatory stage with retinal periphlebitis affecting especially peripheral retina, then an ischemic stage with sclerosis of retinal veins, and finally a proliferative stage characterised by neovascularization, haemorrhage and retinal detachment.

9B78 Certain specified retinal disorders

Coded Elsewhere: Double heterozygous sickling disorders with retinopathy (3A51.3)

Retinal dystrophy in GM2 gangliosidosis (5C56.00)

9B78.0 **Retinal vasculopathy and cerebral leukodystrophy**

Retinal vasculopathy and cerebral leukodystrophy is an inherited group of small vessel diseases comprised of cerebroretinal vasculopathy, hereditary vascular retinopathy and hereditary endotheliopathy with retinopathy, nephropathy and stroke (HERNS); all exhibiting progressive visual impairment as well as variable cerebral dysfunction.

Coded Elsewhere: HERNS syndrome (LD2F.1Y)

9B78.1 **Background retinopathy and retinal vascular changes**

Background retinopathy is the earliest visible change to the retina in diabetes, characterised by some retinal vascular changes such as the capillaries in the retina become blocked, they may bulge slightly (microaneurysm) and may leak blood or fluid.

9B78.10 Changes in retinal vascular appearance

9B78.11 Exudative retinopathy

9B78.12 Retinal vasculitis

9B78.13 Retinal telangiectasis

9B78.1Y Other specified background retinopathy and retinal vascular changes

9B78.1Z Background retinopathy and retinal vascular changes, unspecified

9B78.2 **Other proliferative retinopathy**

Exclusions: proliferative vitreo-retinopathy with retinal detachment (9B73)

Proliferative diabetic retinopathy (9B71.01)

9B78.3 **Degeneration of macula or posterior pole**

Exclusions: Age-related macular degeneration (9B75.0)

9B78.30 Reticular pseudodrusen

Histologically located above the retinal pigment epithelium, this finding is often associated with other retinal disease.

9B78.3Y Other specified degeneration of macula or posterior pole

9B78.3Z Degeneration of macula or posterior pole, unspecified

9B78.4 **Peripheral retinal degeneration**

Exclusions: with retinal break (9B73.4)

9B78.5 **Retinal haemorrhage**

Exclusions: Traumatic retinal haemorrhage (NA06.7)

9B78.6 **Separation of retinal layers**

Inclusions: Detachment of retinal pigment epithelium

9B78.60 Serous detachment of retinal pigment epithelium

This refers to the serous detachment of the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.

9B78.61 Haemorrhagic detachment of retinal pigment epithelium

This refers to the haemorrhagic detachment of the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.

9B78.6Y Other specified separation of retinal layers

9B78.6Z Separation of retinal layers, unspecified

9B78.7 **Retinal oedema**

9B78.8 **Retinal ischaemia**

Coding Note: Code also the causing condition

9B78.9 **Retinal atrophy**

This is a group of genetic diseases and is characterised by the bilateral degeneration of the retina, causing progressive vision loss culminating in blindness.

9B7Y **Other specified disorders of the retina**

9B7Z **Disorders of the retina, unspecified**

Disorders of the vitreous body (9B80-9B8Z)

Any condition of the transparent, semigelatinous substance that fills the cavity behind the crystalline lens of the eye and in front of the retina.

Coded Elsewhere: Congenital anomalies of the vitreous (LA13.0)

9B80 **Inherited vitreoretinal disorders**

Coded Elsewhere: Stickler syndrome (LD2F.1Y)

9B81 **Posterior vitreous detachment**

9B82 **Vitreous prolapse**

Exclusions: vitreous syndrome following cataract surgery (9D20)

9B83 **Vitreous haemorrhage**

9B84 **Vitreous opacities, membranes or strands**

9B8Y **Other specified disorders of the vitreous body**

9B8Z **Disorders of the vitreous body, unspecified**

9C0Y **Other specified disorders of the eyeball - posterior segment**

9C0Z **Disorders of the eyeball - posterior segment, unspecified**

Disorders of the eyeball affecting both anterior and posterior segments (9C20-9C2Z)

9C20 **Panuveitis**

9C20.0 Noninfectious panuveitis

Coded Elsewhere: Multifocal choroiditis (9B65.0)

9C20.1 Infectious panuveitis

Coded Elsewhere: Tuberculous panuveitis (1B12.1)

Infectious panuveitis in Lyme disease (1C1G.12)

9C20.2 Purulent endophthalmitis

Suppurative inflammation of the tissues of the internal structures of the eye; often caused by fungi, necrosis of intraocular tumours, or retained intraocular foreign bodies. Other aetiology can be any infectious uveitis.

9C20.Y Other specified panuveitis

9C20.Z Panuveitis, unspecified

9C21 **Endophthalmitis**

Coded Elsewhere: Purulent endophthalmitis (9C20.2)

9C21.0 Sympathetic uveitis

9C21.Y **Other specified endophthalmitis**

9C21.Z **Endophthalmitis, unspecified**

9C22 **Eyeball deformity**

Coded Elsewhere: Microphthalmos (LA10.0)
Clinical anophthalmos (LA10.1)
Microphthalmos associated with syndromes (LD21.0)

9C22.0 **Atrophic Bulbi**

9C22.1 **Phthisis Bulbi**

9C22.Y **Other specified eyeball deformity**

9C22.Z **Eyeball deformity, unspecified**

9C2Y **Other specified disorders of the eyeball affecting both anterior and posterior segments**

9C2Z **Disorders of the eyeball affecting both anterior and posterior segments, unspecified**

Disorders of the visual pathways or centres (9C40-9C4Z)

This refers to disorders part of the central nervous system which gives organisms the ability to process visual detail, as well as enabling the formation of several non-image photo response functions.

9C40 **Disorder of the optic nerve**

Coded Elsewhere: Congenital malformation of optic disc (LA13.7)
Injury of optic nerve, unilateral (NA04.10)
Malignant neoplasm of the optic nerve (2A02.12)

9C40.0 **Infectious optic neuropathy**

Coded Elsewhere: Late syphilitic retrobulbar neuritis (1A62.20)

9C40.1 **Optic neuritis**

Optic neuritis is a condition related to immune mediated inflammation of the optic nerve. It is commoner in women and can be the first presenting symptom of MS. The symptoms are those of blurred vision, pain on moving the eye and in the vast majority it is self limiting".

Coded Elsewhere: Neuromyelitis optica (8A43)

9C40.10 Retrobulbar neuritis

9C40.1Y Other specified optic neuritis

9C40.1Z Optic neuritis, unspecified

9C40.2 **Neuroretinitis**

9C40.3 **Perineuritis of optic nerve**

Inflammation of the optic nerve sheath without inflammation of the nerve itself

9C40.4 **Ischaemic optic neuropathy**

Optic nerve disorders caused by an ischaemic process of the optic nerve

9C40.40 Anterior ischemic optic neuropathy

This refers to anterior ischemic damage to the optic nerve due to any cause. Damage and death of these nerve cells, or neurons, leads to characteristic features of optic neuropathy.

9C40.41 Posterior ischemic optic neuropathy

This refers to posterior ischemic damage to the optic nerve due to any cause. Damage and death of these nerve cells, or neurons, leads to characteristic features of optic neuropathy.

9C40.4Y Other specified ischaemic optic neuropathy

9C40.4Z Ischaemic optic neuropathy, unspecified

9C40.5 **Compressive optic neuropathy**

Optic nerve disorders caused by the compression of the optic nerve

9C40.6 **Infiltrative optic neuropathy**

Optic nerve disorders caused by an infiltrative process of the optic nerve

9C40.7 **Traumatic optic neuropathy**

Optic nerve disorders due to trauma to the optic nerve

9C40.8 **Hereditary optic neuropathy**

Optic nerve disorders caused by genetic abnormalities

Coded Elsewhere: Leber hereditary optic neuropathy (8C73.Y)

9C40.9 **Glaucomatous optic neuropathy**

Inclusions: Glaucomatous optic atrophy

9C40.A **Optic disc swelling**

This refers to swelling in the location where ganglion cell axons exit the eye to form the optic nerve. There are no light sensitive rods or cones to respond to a light stimulus at this point.

9C40.A0 Papilloedema

Optic disc swelling that results from increased intracranial pressure

Inclusions: Optic disc swelling that results from increased intracranial pressure

9C40.A1 Optic disc swelling associated with uveitis

9C40.AY Other specified optic disc swelling

9C40.AZ Optic disc swelling, unspecified

9C40.B **Optic atrophy**

Optic atrophies (OA) refer to a specific group of hereditary optic neuropathies in which the cause of the optic nerve dysfunction is inherited either in an autosomal dominant or autosomal recessive pattern. Autosomal dominant optic atrophy (ADOA), type Kjer, is the most common OA, whereas autosomal recessive optic atrophy (AROA) is a rare form.

Coded Elsewhere: Leber hereditary optic neuropathy (8C73.Y)

9C40.B0 Congenital optic atrophy

9C40.B1 Acquired optic atrophy

Coding Note: Code also the causing condition

9C40.BZ Optic atrophy, unspecified

9C40.Y **Other specified disorder of the optic nerve**

9C40.Z **Disorder of the optic nerve, unspecified**

9C41 **Disorder of optic chiasm**

This is a group of conditions associated with the optic chiasm, the part of the brain where the optic nerves (CN II) partially cross.

Coding Note: Use additional code, if desired, to identify underlying condition.

9C42 **Disorder of post chiasmal visual pathways**

Coding Note: Use additional code, if desired, to identify underlying condition.

Inclusions: Disorders of optic tracts, geniculate nuclei and optic radiations

9C43 **Disorder of visual cortex**

Coding Note: Use additional code, if desired, to identify underlying condition.

9C44 **Disorder of higher visual centres**

Coding Note: Use additional code, if desired, to identify underlying condition.

9C4Y **Other specified disorders of the visual pathways or centres**

9C4Z **Disorders of the visual pathways or centres, unspecified**

Glaucoma or glaucoma suspect (9C60-9C6Z)

9C60 **Glaucoma suspect**

9C61 **Glaucoma**

Exclusions: Traumatic glaucoma due to birth injury (KA41)

Coded Elsewhere: Glaucomatous optic neuropathy (9C40.9)

9C61.0 **Primary open-angle glaucoma**

Primary open-angle glaucoma is a chronic progressive optic neuropathy with characteristic morphological changes at the optic nerve head and retinal nerve fibre layer in the absence of other ocular disease or congenital anomalies. Progressive retinal ganglion cell death and visual field loss are associated with these changes. Anterior chamber angle appearance is normal and major risk factors include level of intraocular pressure and older age.

9C61.00 Normal tension glaucoma

Normal tension glaucoma is a condition considered to be within the continuum of primary open-angle glaucoma; the term is used when intraocular pressure is within the statistically normal range (10-21 mmHg).

9C61.01 Ocular hypertension

Ocular hypertension is a condition of elevated intraocular pressure in the absence of optic nerve, nerve fibre layer or visual field abnormalities.

9C61.0Y Other specified primary open-angle glaucoma

9C61.0Z Primary open-angle glaucoma, unspecified

9C61.1 **Primary angle closure and angle closure glaucoma**

Primary angle closure glaucoma is a condition described as angle closure or/and peripheral anterior synechiae with elevated intraocular pressure and evidence of optic nerve damage.

9C61.10 Primary angle closure suspect or anatomical narrow angle

Primary angle closure glaucoma suspect is a condition of narrow anterior chamber angle, suspicious for future closure, with no signs of trabecular meshwork or optic nerve damage.

9C61.11 Primary angle-closure

Primary angle closure is a condition defined by the presence of iridotrabecular contact with elevated intraocular pressure or peripheral anterior synechiae but no signs of optic nerve damage.

9C61.12 Primary angle closure glaucoma

Primary angle closure glaucoma is a condition described as angle closure or/and peripheral anterior synechiae with elevated intraocular pressure and evidence of optic nerve damage.

9C61.13 Primary angle closure without pupillary block

Primary angle closure without pupillary block Is a condition described as anatomical variation in the iris root in which narrowing of the anterior chamber angle occurs independent of pupillary block causing angle closure.

9C61.14 Acute angle closure with pupillary block

Acute Angle Closure (AAC) with pupillary block is a condition described as circumferential iris apposition to the trabecular meshwork with rapid and excessive increase in intraocular pressure that does not resolve spontaneously.

9C61.15 Intermittent angle-closure

Intermittent Angle Closure is a milder clinical manifestation of acute angle closure that resolves spontaneously.

9C61.16 Chronic angle-closure

Chronic angle closure is a condition when intraocular pressure elevation is due to variable portions of anterior chamber angle being permanently closed by peripheral anterior synechiae.

9C61.17 Condition after acute angle-closure glaucoma attack

Condition after acute angle closure glaucoma attack refers to a condition after a previous episode of acute angle-closure attack, usually with secondary alterations of the iris (sphincter lesions) and lens (“Glaukomflecken”, cataract).

9C61.1Y Other specified primary angle closure and angle closure glaucoma

9C61.1Z Primary angle closure and angle closure glaucoma, unspecified

9C61.2 **Secondary open-angle glaucoma**

Coding Note: Code also the causing condition

Coded Elsewhere: Glaucoma due to ocular surgery or laser (9D25)

9C61.20 Pseudoexfoliative open-angle glaucoma

Pseudoexfoliative Open-Angle glaucoma is a condition where fibrillar pseudoexfoliative material is produced by various ocular tissues and is deposited on the trabecular meshwork, lens, and other structures of the anterior segment leading to intraocular pressure elevation and subsequent optic nerve damage.

9C61.21 Pigmentary open-angle glaucoma

Pigmentary Open-Angle glaucoma Is a condition where pigment is liberated due to rubbing of the zonules against the posterior iris sheath that leads to obstruction of the trabecular meshwork causing intraocular pressure elevation and subsequent optic nerve damage.

9C61.22 Lens-induced secondary open-angle glaucoma

9C61.23 Glaucoma associated with intraocular haemorrhage

Ghost cell glaucoma is a condition where bleeding into the vitreous body or anterior chamber can lead to intraocular pressure elevation when stiffer red blood cells that have lost their haemoglobin obstruct the trabecular meshwork.

Inclusions: ghost cell glaucoma

9C61.24 Glaucoma due to eye inflammation

Coding Note: Code also the causing condition

9C61.25 Glaucomato-cyclitic crisis

A glaucomato-cyclitic crisis presents with mild keratic precipitates and aqueous flare, acute intraocular pressure elevation and optic nerve damage when repeated attacks occur.

9C61.26 Secondary open-angle glaucoma due to parasitic eye disease

Coding Note: Code also the causing condition

9C61.27 Glaucoma due to intraocular tumours

Coding Note: Code also the causing condition

9C61.28 Glaucoma associated with retinal detachment

Coding Note: Code also the causing condition

9C61.29 Glaucoma due to eye trauma

Coding Note: Code also the causing condition

9C61.2A Glaucoma due to drugs

9C61.2B Glaucoma caused by increased episcleral venous pressure

Coding Note: Code also the causing condition

9C61.2C Secondary glaucoma due to extra-ocular mass

Coding Note: Code also the causing condition

9C61.2Y Other specified secondary open-angle glaucoma

Coding Note: Code also the causing condition

9C61.2Z Secondary open-angle glaucoma, unspecified

Coding Note: Code also the causing condition

9C61.3 Secondary angle closure glaucoma

9C61.30 Secondary angle closure glaucoma with pupillary block

Secondary angle closure glaucoma with pupillary block is a condition where an anteriorly subluxated lens occludes the pupil causing acute secondary angle closure and intraocular pressure elevation.

Coding Note: Code also the causing condition

9C61.31 Secondary angle closure glaucoma without pupillary block

9C61.32 Neovascular secondary angle closure glaucoma

Neovascular secondary angle-closure glaucoma is a frequent condition where neovascular membranes occlude and close the chamber angle by fibrovascular contraction leading to intraocular pressure elevation and subsequent optic nerve damage. Neovascularization can be due to retinal venous occlusion, diabetic retinopathy, ocular ischemia, long-standing retinal detachment and other ischemic conditions of the eye.

Coding Note: Code also the causing condition

9C61.33 Secondary angle closure glaucoma due to endothelial overgrowth

Secondary angle-closure glaucoma due to endothelial overgrowth is a condition where corneal endothelial cells overgrow the trabecular meshwork and iris, closing the angle by tissue contraction leading to intraocular pressure elevation and subsequent optic nerve damage.

9C61.34 Secondary angle closure glaucoma due to epithelial ingrowth

Epithelial ingrowth is a condition after open globe trauma or surgery where conjunctival or corneal epithelial cells get access to the anterior chamber and overgrow the trabecular meshwork with subsequent intraocular pressure elevation and optic nerve damage.

9C61.35 Ciliary block glaucoma

Ciliary block glaucoma is a condition where aqueous misdirection into the vitreous cavity displaces the lens-iris diaphragm anteriorly thus causing angle closure with subsequent intraocular pressure elevation and optic nerve damage.

9C61.36 Secondary angle closure glaucoma due to other anterior displacement of the lens-iris diaphragm

Iris and ciliary body cysts, intraocular tumours, posterior scleritis, uveal effusion, or Silicon Oil or gas in the vitreous cavity can cause IOP elevation by angle closure.

9C61.3Y Other specified secondary angle closure glaucoma

9C61.3Z Secondary angle closure glaucoma, unspecified

9C61.4 **Developmental glaucoma**

Inclusions: Glaucoma of newborn

Hydrophthalmos

9C61.40 Primary congenital glaucoma

Primary Congenital Glaucoma is a condition during early infancy where delayed development and malformation of the trabecular meshwork blocks the outflow routes leading to elevated intraocular pressure that causes enlargement of the eyeball (Buphthalmus), corneal oedema, Descemet tears, myopia, and damage to the optic nerve, often resulting in severe visual impairment or blindness

9C61.41 Primary infantile glaucoma

Primary infantile glaucoma is a condition after 2 years of age where malformation of the trabecular meshwork causes elevated intraocular pressure without enlargement of the eyeball but damage to the optic nerve similar to congenital glaucoma.

9C61.42 Secondary childhood glaucoma

Coding Note: Code also the causing condition

Coded Elsewhere: Aniridia (LA11.3)

Marfan syndrome (LD28.01)

Rubella (1F02)

Oculocerebrorenal syndrome (5C60.0)

Neurofibromatoses (LD2D.1)

9C61.4Y Other specified developmental glaucoma

9C61.4Z Developmental glaucoma, unspecified

9C6Y **Other specified glaucoma or glaucoma suspect**

9C6Z **Glaucoma or glaucoma suspect, unspecified**

Strabismus or ocular motility disorders (9C80-9C8Z)

Disorder due to abnormalities of extraocular muscles or ocular motor abnormalities.

Coded Elsewhere: Diseases of neuromuscular junction or muscle (8C60-8D0Z)

9C80 **Non paralytic strabismus**

Non-paralytic strabismus is an abnormal binocular alignment in which one of the eyes is deviated. There are full ocular movements in each eye. The condition can alternate between eyes or only involve one eye. Strabismus may be intermittent or constant. The abnormal alignment may be present at distance fixation, near fixation or both.

9C80.0 Esotropia

Esotropia is an abnormal binocular alignment in which one of the eyes has an inward deviation. Fixation can be alternatively or monocular. Esotropia is present in all distances. Squint angles can vary with distances.

9C80.1 Exotropia

Exotropia is an abnormal binocular alignment in which one of the eyes has an outward deviation. Fixation can be alternatively or monocular. Exotropia is present in all distances.

9C80.2 Vertical or torsional strabismus

An abnormal binocular alignment which may be constant or intermittent, that is not horizontal, but vertical or torsional (rotational) around the pupillary axis.

9C80.3 Intermittent strabismus

An abnormal binocular alignment which is present intermittently, with normal alignment at other times with binocular single vision.

9C80.30 Intermittent divergent exotropia

9C80.31 Intermittent convergent esotropia

9C80.3Y Other specified intermittent strabismus

9C80.3Z Intermittent strabismus, unspecified

9C80.4 Heterophoria

A temporary deviation of the eyes from normal binocular alignment when there is disruption of the visual input from one eye. The alignment is normal when there is binocular visual input.

9C80.5 **Mechanical strabismus**

An abnormal binocular alignment caused by abnormalities of ocular movement in one or both eyes caused by damage to the extraocular muscles and/or other orbital structures. Mechanical strabismus is characterised by limitation of movements in one or more directions and variable strabismus.

9C80.Y **Other specified non paralytic strabismus**

9C80.Z **Non paralytic strabismus, unspecified**

9C81 Ocular motor nerve palsies

Exclusions: Internuclear ophthalmoplegia (9C83.5)
Internal ophthalmoplegia (9D01.0)
ophthalmoplegia progressive supranuclear (8A00.10)

9C81.0 **Third nerve palsy**

Inclusions: isolated oculomotor nerve palsy

9C81.00 External bilateral paralysis of oculomotor nerve

9C81.0Y Other specified third nerve palsy

9C81.0Z Third nerve palsy, unspecified

9C81.1 **Fourth nerve palsy**

Inclusions: isolated trochlear nerve palsy

9C81.2 **Sixth nerve palsy**

Inclusions: isolated abducent nerve palsy

9C81.3 **Total external ophthalmoplegia**

9C81.4 **Cavernous sinus syndromes**

9C81.Y **Palsy of other specified ocular motor nerve**

9C81.Z **Palsy of unspecified ocular motor nerve**

9C82 Disorders of extraocular muscles

Coded Elsewhere: Certain paralytic strabismus (9C81.Y)

9C82.0 Progressive external ophthalmoplegia

Chronic ophthalmoplegia is characterised by progressive weakness of ocular muscles and levator muscle of the upper eyelid. The condition is mainly manifested in adults. It may be totally and permanently isolated, however in a minority of cases it is associated with skeletal myopathy, which causes abnormal fatigability and even permanent muscle weakness. In this case the affection is still termed isolated progressive external ophthalmoplegia. A large proportion of chronic ophthalmoplegias presents with multisystemic pattern of signs: neurological signs (hearing loss, retinopathy, cerebellar disorders, peripheral neuropathy, etc.), endocrine (diabetes, hypogonadism, hypoparathyroidism, etc.), kidney (kidney failure, tubulopathy, etc.), and heart disorders (conduction disorders, myocardiopathy, etc.).

9C82.1 Muscular dystrophy affecting extraocular muscle

Non-specific term that is used to describe a range of primary myopathies that affect the extraocular muscles.

Exclusions: Secondary myopathies (8C80-8C8Z)

Coded Elsewhere: Congenital fibrosis of extraocular muscles (9C82.2)

9C82.2 Congenital cranial dysinnervation syndrome

9C82.3 Restrictive ophthalmopathy

Coding Note: Code also the causing condition

9C82.4 Oculomotor apraxia

9C82.Y Other specified disorders of extraocular muscles

9C82.Z Disorders of extraocular muscles, unspecified

9C83 Disorders of binocular movement

Other disorders of binocular movement in which the movement of the two eyes is abnormal.

9C83.0 Palsy of conjugate gaze

A palsy of conjugate gaze is an incomplete or absent movement of the two eyes in a particular direction of gaze.

Coded Elsewhere: Progressive supranuclear palsy (8A00.10)

9C83.00 Horizontal gaze palsy

A palsy of horizontal gaze is an incomplete or absent movement of the two eyes in a horizontal direction of gaze. May be in one or both directions

9C83.01 Vertical gaze palsy

A palsy of vertical gaze is an incomplete or absent movement of the two eyes in the vertical direction of gaze.

9C83.02 Monocular elevator palsy

Monocular elevator palsy is an incomplete or absent movement of one eyes in upgaze. May be due to pathology in the orbit, as well as infranuclear, internuclear, or supranuclear in origin.

9C83.0Y Other specified palsy of conjugate gaze

9C83.0Z Palsy of conjugate gaze, unspecified

9C83.1 **Spasm of conjugate gaze**

9C83.10 Horizontal conjugate gaze deviation

9C83.11 Upward gaze deviation

9C83.12 Downward gaze deviation

9C83.13 Oculogyric crisis

Episodic spells of tonic upward and sometimes laterally deviation of the eyes, rarely downward

9C83.1Y Other specified spasm of conjugate gaze

9C83.1Z Spasm of conjugate gaze, unspecified

9C83.2 **Convergence insufficiency**

9C83.3 **Convergence excess**

9C83.4 **Spasm of the near reflex**

9C83.5 **Internuclear ophthalmoplegia**

This is a disorder of conjugate lateral gaze in which the affected eye shows impairment of adduction.

9C83.6 **Anomalies of divergence or deviation of eye movement**

9C83.60 Divergence insufficiency

9C83.61 Divergence paralysis

9C83.62 Divergence excess

9C83.63 Synergistic divergence

Anomalous innervation of muscle normally supplied by the oculomotor nerve.

In congenital unilateral adduction palsy, when adduction is attempted, the affected eye abducts rather than adducts.

9C83.64 Skew deviation

a vertical misalignment of the visual axes caused by a disturbance of prenuclear inputs

9C83.65 Ocular tilt reaction
skew deviation associated with ocular torsion (cyclodeviation) and a head tilt (ear to shoulder)

9C83.66 Alternating skew deviation

9C83.67 Dissociative vertical divergence

9C83.6Y Other specified anomalies of divergence or deviation of eye movement

9C83.6Z Anomalies of divergence or deviation of eye movement, unspecified

9C83.Y **Other specified disorders of binocular movement**

9C83.Z **Disorders of binocular movement, unspecified**

9C84 Nystagmus

9C84.0 **Physiological nystagmus**

9C84.1 **Congenital forms of nystagmus**

9C84.2 **Vestibular nystagmus**

9C84.20 Down beat nystagmus

9C84.21 Upbeat nystagmus

9C84.22 Torsional nystagmus

9C84.23 Perverted nystagmus

9C84.2Y Other specified vestibular nystagmus

9C84.2Z Vestibular nystagmus, unspecified

9C84.3 **Seesaw nystagmus**

9C84.4 **Gaze-evoked nystagmus**

9C84.5 **Nystagmus occurring in visual system disorders**

Coding Note: Code also the causing condition
Coded Elsewhere: Spasmus nutans (8A04.Y)

9C84.50 Visual deprivation nystagmus

9C84.51 Divergence nystagmus

9C84.52 Convergence-retraction nystagmus

9C84.5Y Other specified nystagmus occurring in visual system disorders

Coding Note: Code also the causing condition

9C84.5Z Nystagmus occurring in visual system disorders, unspecified

Coding Note: Code also the causing condition

9C84.6 **Eyelid nystagmus**

9C84.Y **Other specified nystagmus**

9C84.Z **Nystagmus, unspecified**

9C85 **Certain specified irregular eye movements**

9C85.0 **Anomalies of saccadic eye movements**

9C85.00 Disorders of the saccadic pulse

9C85.01 Disorders of the saccadic step

Coded Elsewhere: Gaze-evoked nystagmus (9C84.4)

9C85.02 Inappropriate saccades

Inclusions: Saccadic intrusions and oscillations

9C85.0Y Other specified anomalies of saccadic eye movements

9C85.0Z Anomalies of saccadic eye movements, unspecified

9C85.1 **Anomalies of smooth pursuit movements**

9C85.2 **Nonorganic eye movement disorders**

9C85.Y **Other specified irregular eye movements**

9C85.Z **Irregular eye movements, unspecified**

9C8Y **Other specified strabismus or ocular motility disorders**

9C8Z **Strabismus or ocular motility disorders, unspecified**

Disorders of refraction or accommodation (9D00-9D0Z)

9D00 **Disorders of refraction**

9D00.0 **Myopia**

A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus in front of the retina when ocular accommodation is relaxed. This usually results from the eyeball being too long from front to back, but can be caused by an overly curved cornea, a lens with increased optical power, or both. It is also called nearsightedness.

Exclusions: degenerative myopia (9B76)

9D00.1 **Hypermetropia**

A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus behind the retina, as a result of the eyeball being too short from front to back. It is also called farsightedness because the near point is more distant than it is in emmetropia with an equal amplitude of accommodation.

9D00.2 **Astigmatism**

Unequal curvature of the refractive surfaces of the eye. Thus a point source of light cannot be brought to a point focus on the retina but is spread over a more or less diffuse area. This results from the radius of curvature in one plane being longer or shorter than the radius at right angles to it.

9D00.3 **Presbyopia**

The normal decreasing elasticity of the crystalline lens that leads to loss of accommodation.

9D00.4 **Anisometropia**

9D00.5 **Aniseikonia**

9D00.6 **Transient refractive change**

9D00.Y **Other specified disorders of refraction**

9D00.Z **Disorders of refraction, unspecified**

9D01 **Disorders of accommodation**

9D01.0 **Internal ophthalmoplegia**

9D01.1 **Paresis of accommodation**

9D01.2 **Spasm of accommodation**

9D01.Y **Other specified disorders of accommodation**

9D01.Z **Disorders of accommodation, unspecified**

9D0Y **Other specified disorders of refraction or accommodation**

9D0Z **Disorders of refraction or accommodation, unspecified**

Postprocedural disorders of eye or ocular adnexa (9D20-9D25)

Exclusions: pseudophakia (QB51.2)

Coded Elsewhere: Haemorrhage and haematoma of eye or ocular adnexa complicating a procedure (NE81.01)

Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

9D20 **Bullous aphakic keratopathy following cataract surgery**

Inclusions: Vitreal corneal syndrome

9D21 **Cataract lens fragments in eye following cataract surgery**

9D22 **Chorioretinal scars after surgery for detachment**

9D23 **Conjunctival blebitis after glaucoma surgery**

9D24 **Complications with glaucoma drainage devices**

9D25 **Glaucoma due to ocular surgery or laser**

Impairment of visual functions (9D41-9D7Z)

Coded Elsewhere: Impairment of electrophysiological functions (MC21)

Polyopia (9D53)

9D41 **Impairment of visual field**

Ranges of visual field impairment refer to the extent of peripheral vision outside fixation. The extent should be measured for each eye separately.

9D42 **Patterns of visual field impairment**

Patterns of visual field impairment are often indicative for certain disease conditions.

9D42.0 **Visual field loss, pattern not specified**

9D42.2 **Peripheral field deficit**

9D42.20 Enlarged blind spot

Inclusions: Scotoma of blind spot area

9D42.21 Arcuate scotoma

A Bjerrum or arcuate scotoma follows the pattern of the retinal nerve fibres. It is typical for glaucomatous defects and can also be caused by juxta-papillary lesions.

9D42.22 Nasal step

A nasal step is a discontinuity of the nasal field limit at the horizontal meridian. It is typical for glaucoma.

9D42.23 Ring scotoma

A ring scotoma is a scotoma that surrounds the central field. Initially, it may consist of several smaller scotomas that gradually coalesce.

9D42.24 Isolated peripheral scotoma

Isolated scotomas may be the result of scarring from infections or surgery.

9D42.2Y Other specified peripheral field deficit

9D42.2Z Peripheral field deficit, unspecified

9D42.3 **Hemianopic or quadrantic loss**

Defects that cover a hemi-field or a quadrant in one eye may be the result of optic nerve involvement.

9D42.4 **Central scotoma**

A central scotoma is a defect that covers the fovea. It therefore causes visual acuity loss and may necessitate eccentric fixation.

9D42.5 **Para-central scotoma**

A para-central scotoma is a scotoma adjacent to the fovea. Both may minimally affect letter chart acuity, but may interfere significantly with reading and other activities.

9D42.6 **Homonymous hemianopia or quadrant anopia**

Homonymous, binocular field defects present the same or similar patterns in both eyes. They are caused by lesions of the retro-chiasmal pathways.

9D42.60 Right hemi-field homonymous hemianopia or quadrant anopia

9D42.61 Left hemi-field homonymous hemianopia or quadrant anopia

9D42.6Y Other specified homonymous hemianopia or quadrant anopia

9D42.6Z Homonymous hemianopia or quadrant anopia, unspecified

9D42.7 **Heteronymous hemianopia or quadrant anopia**

Heteronymous field defects present opposite patterns in the two eyes. They are caused by may be caused by-chiasmal lesions.

9D42.70 Bi-nasal defects heteronymous hemianopia or quadrant anopia

9D42.71 Bi-temporal defects heteronymous hemianopia or quadrant anopia

9D42.7Y Other specified heteronymous hemianopia or quadrant anopia

9D42.7Z Heteronymous hemianopia or quadrant anopia, unspecified

9D42.8 **Visual field loss, other specified forms**

9D42.Y **Other specified patterns of visual field impairment**

9D42.Z **Patterns of visual field impairment, unspecified**

9D43 Impairment of contrast vision

Contrast sensitivity refers to the ability to distinguish small differences in brightness between adjacent surfaces.

Peak Contrast sensitivity refers to the smallest differences that are discernible for large stimuli.

For smaller objects, such as those involved in many Activities of Daily Living, contrast sensitivity interacts with visual acuity and visual field. Better contrast makes smaller details visible. The visual field is larger for stronger stimuli.

9D44 Impairment of colour vision

Colour vision refers to the ability to distinguish colour differences. True colour “blindness” is extremely rare. Most colour vision deficiencies are minor, and congenital, with X-linked recessive inheritance (more prevalent among men). Some drugs and optic neuritis may also cause colour vision deficiencies.

Inclusions: achromatopsia

acquired colour vision deficiency

colour blindness

9D45 **Impairment of light sensitivity**

Coded Elsewhere: Vitamin A deficiency with night blindness (5B55.0)

9D46 **Impairment of binocular functions**

Subjective visual experiences (9D50-9D5Z)

Subjective Visual Experiences are experiences reported by patients, whose presence or absence cannot be verified objectively.

9D50 **Visual discomfort**

Inclusions: Asthenopia

9D51 **Transient visual loss**

Coded Elsewhere: Amaurosis fugax (8B10.0)

9D52 **Hemifield losses**

9D53 **Entoptic phenomena**

Entoptic phenomena are visual phenomena caused by changes within the eye.

Coded Elsewhere: Visual floaters (MC1A)

9D54 **Visual illusions**

Visual illusions refer to percepts based on an erroneous interpretation of visual input.

9D55 **Nonorganic visual loss**

9D56 **Visual release hallucinations**

Visual release hallucinations, also called Charles Bonnet syndrome, refer to the experience of complex visual hallucinations in a person who has experienced partial or complete loss of vision. Hallucinations are exclusively visual, usually temporary, and unrelated to mental and behavioural disorders.

Exclusions: Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

9D5Y **Other specified subjective visual experiences**

9D5Z **Subjective visual experiences, unspecified**

9D7Y **Other specified impairment of visual functions**

9D7Z **Impairment of visual functions, unspecified**

Vision impairment (9D90-9D9Z)

A vision impairment results when an eye condition affects the visual system and one or more of its vision functions. Typically, population-based surveys measure visual impairment using exclusively visual acuity, with severity categorized as mild, moderate or severe distance vision impairment or blindness, and near vision impairment. However, in the clinical setting, other visual functions are also often assessed, such as a person's field of vision, contrast sensitivity and colour vision.

9D90 Vision impairment including blindness

The table below gives a classification of severity of vision impairment based on visual acuity. For epidemiological studies, it is recommended to collect the following information on visual acuity for each eye, for both eyes open and for distance and near.

a. Uncorrected visual acuity
b. Presenting visual acuity
c. Best corrected visual acuity

Blindness is also categorized according to the degree of constriction of the central visual field in the better eye to less than 10 degrees.

For capturing and coding of "No vision impairment", use QA00.62 (QA00.6 Examination of eyes or vision).

Category	**Visual acuity *1**	
	Worse than:	**Equal to or better than:**
No vision impairment		• 6/12 • 5/10 (0.5) • 20/40 • 0.3
1 Mild vision impairment	• 6/12 • 5/10 (0.5) • 20/40 • 0.3	• 6/18 • 3/10 (0.3) • 20/70 • 0.5
2 Moderate vision impairment	• 6/18 • 3/10 (0.3) • 20/70 • 0.5	• 6/60 • 1/10 (0.1) • 20/200 • 1.0
3 Severe vision impairment	• 6/60 • 1/10 (0.1) • 20/200 • 1.0	• 3/60 • 1/20 (0.05) • 20/400 • 1.3

Category	Visual acuity *1	
	Worse than:	**Equal to or better than:**
4 Blindness	• 3/60 • 1/20 (0.05) • 20/400 • 1.3	• 1/60 or counts fingers (CF) • at 1 metre • 1/50 (0.02) • 20/1200 or counts fingers (CF) • at 1 metre • 1.8
5 Blindness	• 1/60 • 1/50 (0.02) • 5/300 (20/1200) • 1.8	Light perception
6 Blindness	No light perception	
9	Undetermined or unspecified	
Near vision impairment	N6 or M 0.8 at 40cms	

*1 Presented in metres, decimals, feet and logMar

Coded Elsewhere: No vision impairment (QA00.62)

9D90.1 Mild vision impairment

9D90.2 Moderate vision impairment

Inclusions: visual impairment category 2, in both eyes

9D90.3 Severe vision impairment

Inclusions: visual impairment category 3 in one eye, with categories 1 or 2 in the other eye

9D90.6 Blindness

The numerical definition used for WHO statistics refers to profound, near-total or total loss. The functional definition refers to individuals who have little or no residual vision and who have to rely predominantly on vision substitution skills, i.e. on using senses other than vision (Braille or talking books for reading, a long cane or guide dog for mobility, or touch for manipulation).

Inclusions: visual impairment category 5

visual impairment categories 4, 5, 6 in both eyes

visual impairment categories 4, 5, 6 in one eye and categories 1, 2, 3 or 9 in the other eye

visual impairment categories 4, 5, 6 in one eye [normal vision in other eye]

9D90.7 **Near vision impairment**

Near vision refers to the ability to perform tasks that require detailed vision at a close distance. It should be measured with both eyes open at the subject's preferred viewing distance and with the subject's habitual near vision correction (if any). Near vision impairment is characterised by a presenting near visual acuity worse than N6.

9D92 **Specific vision dysfunctions**

Specific visual dysfunctions refer to functional deficits in higher cerebral centres. Such dysfunctions may exist with or without visual impairment of the eyes and the lower visual system.

9D93 **Complex vision-related dysfunctions**

Complex Vision-Related Dysfunctions involve interactions with other sensory and motor systems. They reflect the combined effects at all stages of processing.

9D94 **Impairment of presenting visual acuity**

9D95 **Impairment of best corrected visual acuity**

9D96 **Impairment of uncorrected visual acuity**

9D9Y **Other specified vision impairment**

9D9Z **Vision impairment, unspecified**

9E1Y **Other specified diseases of the visual system**

9E1Z **Diseases of the visual system, unspecified**

CHAPTER 10

Diseases of the ear or mastoid process

This chapter has 79 four-character categories.

Code range starts with AA00

This chapter contains diseases of the ear and diseases of the mastoid process.

Exclusions: Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Certain infectious or parasitic diseases (Chapter 01)

Certain conditions originating in the perinatal period (Chapter 19)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Neoplasms (Chapter 02)

Endocrine, nutritional or metabolic diseases (Chapter 05)

Coded Elsewhere: Structural developmental anomalies of the ear (LA20-LA2Z)

Symptoms, signs or clinical findings of ear or mastoid process (MC40-MC6Y)

This chapter contains the following top level blocks:

- Diseases of external ear
- Diseases of middle ear or mastoid
- Diseases of inner ear
- Disorders with hearing impairment
- Disorders of ear, not elsewhere classified
- Postprocedural disorders of ear or mastoid process

Diseases of external ear (AA00-AA6Z)

Coded Elsewhere: Inflammatory disorders of the external ear (EG40-EG4Z)

Infectious diseases of external ear (AA00-AA0Z)

Coded Elsewhere: Erysipelas of external ear (1B70.01)

Candida otomycosis (1F23.16)

Herpes simplex infection of external ear (1F00.0Y)

Otitis externa due to zoster (1E91.Y)

AA00 **Abscess of external ear**

A fluctuant collection of purulent exudate and necrotic tissue located in the external auditory canal or in the soft tissues of the pinna, most commonly due to Staphylococcus aureus.

AA01 **Cellulitis of external ear**

A diffuse subacute bacterial infection of the soft tissues of the external ear, most commonly due to beta-haemolytic streptococci. It may arise within an apparently healthy external ear but may complicate both inflammatory and infective forms of otitis externa.

Exclusions: Erysipelas of external ear (1B70.01)

Staphylococcal cellulitis of skin (1B70.2)

Streptococcal cellulitis of skin (1B70.1)

AA02 **Malignant otitis externa**

Malignant otitis externa is a rare life-threatening infective complication of otitis externa. It is due in the majority of cases to Pseudomonas aeruginosa. Organisms penetrate from the external ear canal into the surrounding deeper tissues resulting in osteomyelitis of the temporal bone and risks of damage to adjacent cranial nerves and septic thrombo-emboli to the brain. Advanced age, uncontrolled diabetes mellitus and immunosuppression are risk factors.

AA03 **Otomycosis**

Fungal infection of the ear. Otomycosis is due to Aspergillus spp., especially A. niger, in 75% or more of cases and Candida in most of the remainder.

Coded Elsewhere: Aspergillus otomycosis (1F20.10)

Candida otomycosis (1F23.16)

AA04 **Perichondritis of external ear**

Perichondritis is an infection of the tissue surrounding the cartilage of the outer ear, the perichondrium. It usually results from injury to the ear from ear surgery, ear piercing (especially piercing of the cartilage), or trauma from contact sports. The most common bacterium causing perichondritis is Pseudomonas aeruginosa. Presenting features include pain, redness and swelling of the auricle, and fever.

AA0Y **Other specified infectious diseases of external ear**

AA0Z **Infectious diseases of external ear, unspecified**

Otitis externa (AA10-AA3Z)

Inflammation of the outer ear including the external ear canal, cartilages of the auricle, and the tympanic membrane.

Noninfectious inflammation of external ear (AA10-AA1Z)

Coded Elsewhere: Contact dermatitis of external ear (EG40)

Juvenile spring eruption (EJ30.0)

AA10 **Seborrhoeic otitis externa**

Seborrhoeic dermatitis affecting the skin of the external ear. It is usually accompanied by evidence of seborrhoeic dermatitis at other sites. In mild cases it may be asymptomatic but it can present acutely with severe pain, oedema and exudation. Longstanding cases maybe complicated by chronic lymphoedema and occlusion of the external auditory canal.

Exclusions: Seborrhoea (ED91.2)

AA11 **Acute noninfectious otitis externa**

Rapid onset of eczematous inflammation of the outer ear the cause of which cannot be more precisely classified.

Exclusions: Acute seborrhoeic otitis externa (AA10)

Allergic contact dermatitis of external ear (EG40.0)

Irritant contact dermatitis of external ear (EK02.10)

AA12 **Chondrodermatitis nodularis**

A common pressure-induced painful nodule or ulcer affecting the external ear. It results from ischaemia of skin and underlying cartilage from a focal point of high pressure from the weight of the recumbent head. The site of involvement is dependent on the shape of the pinna (most commonly the helix is involved but in some individuals it is the antihelix which is more prominent) and whether the sufferer is limited to sleeping on one side and is thus unable to spare the ear from constant pressure when lying in bed.

AA13 **Chronic otitis externa**

AA1Y **Other specified noninfectious inflammation of external ear**

AA1Z **Noninfectious inflammation of external ear, unspecified**

AA3Y **Other specified otitis externa**

Coding Note: Code also the causing condition

AA3Z **Otitis externa, unspecified**

Coding Note: Code also the causing condition

Noninflammatory disorders of the external ear (AA40-AA4Z)

Miscellaneous noninflammatory disorders involving the external ear.

Coded Elsewhere: Ear-lobe keloid (EE60.00)

Acanthoma fissuratum (EH92.Y)

AA40 Acquired deformity of external auditory canal

AA40.0 Exostosis of external auditory canal

AA40.1 Acquired stenosis of external auditory canal

Acquired stenosis of external auditory canal was described as resulting from a number of different causes. Since then, histology and imaging studies of this disease have shown that a common cascade of inflammatory changes resulting from these different causes is the primary pathogenesis leading to medial canal fibrosis. Once there is complete obstruction of the external auditory canal, surgery is the primary treatment.

AA40.2 Cholesteatoma of external auditory canal

AA40.Y Other specified acquired deformity of external auditory canal

AA41 Acquired deformity of pinna

Acquired deformities involving the external ear.

Inclusions: Acquired deformity of auricle

AA41.0 Cauliflower ear

Cauliflower ear is the end result of fibrosis of the skin and soft tissues of the pinna following a traumatic subperichondrial haematoma, usually due to trauma. It manifests as permanent swelling and deformity of the ear, described as resembling a cauliflower. It is found most commonly amongst men involved in contact sports such as boxing, wrestling, martial arts and rugby football.

AA41.Y Other specified acquired deformity of pinna

AA42 Impacted cerumen

Impacted cerumen is the presence of occlusive aural wax in the external ear canal. Wax may cause tinnitus or otalgia and removal may be required to allow adequate otoscopic examination and/or alleviate symptoms.

AA4Y Other specified noninflammatory disorders of the external ear

AA4Z Noninflammatory disorders of the external ear, unspecified

---

AA6Z Diseases of external ear, unspecified

Diseases of middle ear or mastoid (AA80-AB1Z)

Middle ear, derived from the first pharyngeal (branchial) pouch; has the malleus and incus and stapes and includes the spaces of the epitympanum and mesotympanum and hypotympanum. The mastoid; normally contains "air"; the lateral boundary of the mesotympanum is where the tympanic membrane is, or normally would be located.

Coded Elsewhere: Congenital conductive hearing loss (AB50.0)

Otosclerosis (AB33)

Congenital mixed conductive and sensorineural hearing loss (AB50.2)

Otitis media (AA80-AB0Z)

Nonsuppurative otitis media (AA80-AA8Z)

AA80 **Acute serous or mucoid otitis media**

Acute serous or mucoid otitis media is a collection of non-infected fluid in the middle ear that has developed as a result of a upper respiratory infection.

AA81 **Acute nonserous nonsuppurative otitis media**

Exclusions: Otitic barotrauma (NF04.0)

AA82 **Chronic serous or mucoid otitis media**

Chronic serous or mucoid otitis media is probably the most common form of sub-acute middle ear disease found in the developed world. It typically lingers following otitis media, when the fluid in the ear, formed by the infection, does not clear spontaneously. The tympanic membrane is intact but the middle ear is liquid- fluid filled. This presumably puts the middle ear at risk for further infection and often worsens hearing by about 30 dB. This is most frequently found in children and can interfere with language acquisition and learning.

AA83 **Noninfected otitis media with effusion**

AA8Z **Nonsuppurative otitis media, unspecified**

Suppurative otitis media (AA90-AA9Z)

This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope, unspecified.

AA90 **Acute suppurative otitis media**

Acute suppurative otitis media is defined as an inflammation of the middle ear which erupts suddenly and passes quickly. It is characteristic to have a middle-ear infection behind a reddened eardrum.

AA91 **Chronic suppurative otitis media**

AA91.0 **Chronic tubotympanic suppurative otitis media**

Having a tympanic membrane perforation for at least three months, chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic tubotympanic suppurative otitis media is considered "safe" (meaning it is unlikely to become a worse problem for the patient) if it involves a central perforation of the pars tensa with the inflammatory process affecting the mucosa of the middle ear cleft.

Inclusions: Benign chronic suppurative otitis media

Chronic tubotympanic disease

AA91.1 **Chronic atticoantral suppurative otitis media**

Chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic atticoantral suppurative otitis media which is unsafe type is typified by a marginal perforation of the posterosuperior pars tensa or pars flaccida.

Inclusions: Chronic atticoantral disease

AA91.2 **Other chronic suppurative otitis media**

This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope.

AA91.Z **Chronic suppurative otitis media, unspecified**

AA9Y **Other specified suppurative otitis media**

AA9Z **Suppurative otitis media, unspecified**

AB00 **Acute otitis media**

Coded Elsewhere: Acute nonserous nonsuppurative otitis media (AA81)

Acute suppurative otitis media (AA90)

AB01 **Chronic otitis media**

Coded Elsewhere: Chronic serous or mucoid otitis media (AA82)

Chronic suppurative otitis media (AA91)

AB0Y **Other specified otitis media**

Coding Note: Code also the causing condition

AB0Z **Otitis media, unspecified**

Coding Note: Code also the causing condition

AB10 **Disorders of Eustachian tube**

AB10.0 **Diverticulum of Eustachian tube**

AB10.1 **Patulous Eustachian tube**

AB10.2 **Eustachian salpingitis**

AB10.3 **Obstruction of Eustachian tube**

Inclusions: Compression of Eustachian tube

Stricture of Eustachian tube

AB10.Y **Other specified disorders of Eustachian tube**

AB10.Z **Disorders of Eustachian tube, unspecified**

AB11 Mastoiditis or related conditions

AB11.0 **Acute mastoiditis**

Rapid onset inflammation of the mastoid bone, located in the skull just behind the ear. It is often a complication of otitis media.

AB11.1 **Chronic mastoiditis**

Persistent or recurrent inflammation of the space in the mastoid bone. It is often a complication of otitis media.

AB11.2 **Petrositis**

AB11.3 **Mastoiditis, not elsewhere classified**

AB11.Y **Other specified mastoiditis or related conditions**

AB12 Cholesteatoma of middle ear

Exclusions: Recurrent cholesteatoma of postmastoidectomy cavity (AB90)

Cholesteatoma of external auditory canal (AA40.2)

AB13 Perforation of tympanic membrane

Exclusions: Traumatic rupture of ear drum (NA0A.2)

AB13.0 **Central perforation of tympanic membrane**

A temporary or persistent opening in the central portion of the tympanic membrane. Clinical signs depend on the size, location, and associated pathological condition.

AB13.1 **Attic perforation of tympanic membrane**

Inclusions: Perforation of pars flaccida

AB13.2 **Other marginal perforations of tympanic membrane**

AB13.Y **Other specified perforation of tympanic membrane**

AB13.Z **Perforation of tympanic membrane, unspecified**

AB14 **Acute myringitis**

Myringitis is the inflammation of the tympanic membrane, often involving painful blisters on the tympanic membrane. It can develop as self-maintained primary disease of the TM (primary myringitis) or as an effect of an inflammatory process of adjacent tissues of the external or middle ear (secondary myringitis). Myringitis may be accompanied by hearing impairment and a sensation of congestion and earache. It is generally a viral or bacterial infection and may occur with otitis media. After 3 weeks, acute myringitis becomes subacute and, within 3 months, chronic.

Inclusions: Acute tympanitis

Exclusions: Acute myringitis with otitis media (AB00)

AB15 **Chronic myringitis**

Persistent or recurrent inflammation of the tympanic membrane.

Inclusions: Chronic tympanitis

Exclusions: Chronic myringitis with otitis media (AB01)

AB16 **Tympanosclerosis**

Tympanosclerosis is a scarring process with a remarkable variability in its localization within the middle ear. It can lead to conductive hearing loss.

AB17 **Adhesive middle ear disease**

Inclusions: Adhesive otitis

Exclusions: glue ear (AA82)

AB18 **Discontinuity or dislocation of ear ossicles**

AB19 **Acquired abnormalities of ear ossicles not related to discontinuity or dislocation**

AB1A **Polyp of middle ear**

AB1A.0 **Aural polyp**

AB1A.Y **Other specified polyp of middle ear**

AB1A.Z **Polyp of middle ear, unspecified**

AB1B **Middle ear cicatrix**

AB1Y **Other specified diseases of middle ear or mastoid**

AB1Z **Diseases of middle ear or mastoid, unspecified**

Diseases of inner ear (AB30-AB3Z)

Coded Elsewhere: Congenital mixed conductive and sensorineural hearing loss (AB50.2)

Congenital sensorineural hearing loss (AB50.1)

AB30 Acute vestibular syndrome

A clinical syndrome of acute-onset, continuous vertigo, dizziness, or unsteadiness lasting days to weeks, and generally including features suggestive of new, ongoing vestibular system dysfunction (e.g., vomiting, nystagmus, severe postural instability). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Acute vestibular syndrome usually connotes a single, monophasic event, often caused by a one-time disorder, but it may instead punctuate a relapsing-and-remitting or stepwise, progressive illness course. Disorders typically presenting this syndrome include vestibular neuritis, acute labyrinthitis, traumatic vestibulopathy, demyelinating disease with vestibular involvement, and strokes affecting central or peripheral vestibular structures.

Coding Note: Code also the causing condition

AB30.0 Vestibular neuritis

Vestibular neuritis (also known as vestibular neuronitis) may be described as acute, sustained dysfunction of the peripheral vestibular system with secondary nausea, vomiting, and vertigo. Important negative features include aural fullness and hearing loss.

AB30.1 Labyrinthitis

Labyrinthitis is an inflammatory disorder of the inner ear (labyrinth) producing disturbances of balance and hearing to varying degrees. It can be caused by bacterial or viral infections and autoimmune processes.

AB30.Y Other specified acute vestibular syndrome

Coding Note: Code also the causing condition

AB30.Z Acute vestibular syndrome, unspecified

Coding Note: Code also the causing condition

AB31 Episodic vestibular syndrome

A clinical syndrome of transient vertigo, dizziness, or unsteadiness lasting seconds to hours, occasionally days, and generally including features suggestive of temporary, short-lived vestibular system dysfunction (e.g., nausea, nystagmus, sudden falls). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Episodic vestibular syndrome usually connotes multiple, recurrent events caused by an episodic disorder with repeated spells (triggered or spontaneous), but may initially present after the first event.

Coded Elsewhere: Benign paroxysmal vertigo of childhood (8A80.Y)

AB31.0 **Meniere disease**

Meniere Disease (MD) is a chronic progressive inner ear disease, with endolymphatic hydrops. It is characterised by recurrent attacks of debilitating spontaneous vertigo lasting from 20 minutes to up to 12 hours, accompanied by a sense of fullness and tinnitus in the affected ear, and ipsilateral fluctuating sensorineural hearing loss (SNHL) in the low or low and middle frequencies. There may be nystagmus during attacks and falls are frequent. When known, etiology should be added.

Inclusions: Labyrinthine hydrops

AB31.1 **Vestibular migraine**

Recurrent attacks of moderate to severe vestibular symptoms lasting from 5 minutes to 72 hours in patients with a past or ongoing history of migraine headaches. Vestibular symptoms are usually spontaneous and positional vertigo, head motion-induced and visual vertigo as well as head motion-induced dizziness with nausea. Attacks of vestibular symptoms may occur together or independently of migraine symptoms like headache, photophobia, phonophobia or visual aura.

AB31.2 **Benign positional paroxysmal vertigo**

Benign paroxysmal positional vertigo is defined as an abnormal sensation of motion that is elicited by certain critical provocative physical positions of the patient (e.g. becoming dorsal recumbent). The provocative positions usually trigger specific eye movements (e.g. nystagmus). The character and direction of the nystagmus is specific to the part of the inner ear affected and the underlying pathophysiology.

AB31.3 **Superior canal dehiscence syndrome**

Superior canal dehiscence syndrome (SCDS) occurs when thin or dehiscent bone over the superior semicircular canal, best demonstrated on CT, allows pressure transmission between the canal and the intracranial space. Vertigo and nystagmus may occur when the canal is stimulated by loud sounds or changes in middle ear or intracranial pressure. Hyperacusis to bone-conducted sounds can cause conductive hearing loss, pulsatile tinnitus, or autophony (hearing one’s own body sounds as loud or distorted). While the bony defect may be congenital, head trauma can be the final step that opens a functionally mobile labyrinthine window.

AB31.4 **Disembarkment syndrome**

Disembarkment syndrome, or Mal de debarquement (MdD) occurs when habituation to unfamiliar motion patterns like traveling on a boat, train, or airplane, becomes resistant to re-adaption on return to stable conditions. It results in an illusion of self motion typically described as rocking, bobbing, or swaying. Brief periods of MdD (hours) are common in healthy individuals, this otherwise natural phenomenon can become persistent in some individuals.

AB31.5 **Autoimmune inner ear disease**

Autoimmune inner ear disease (AIED) is a clinical syndrome of bilateral sensorineural hearing loss (SNHL) >30dB at one or more frequencies progressing over a period of 3-90 days. Progression of SNLH >15dB at one frequency or >10dB in two frequencies in at least one ear should be demonstrated. Vestibular symptoms may be present in 50% of patients and systemic autoimmune disease (SAD) coexists in 30% of patients.

AB31.6 Vestibular paroxysmia

Vestibular paroxysmia (VP) is characterised by recurrent spells of vertigo or dizziness, lasting seconds to minutes, often many times a day. Attacks usually occur spontaneously but may occasionally be induced by changes of head position (which then needs to be distinguished from benign paroxysmal positioning vertigo). Possible accompanying symptoms are short attacks of tinnitus or changes in hearing. In the attack-free interval mild to moderate impairments of vestibular or audiological function may be found. Neurovascular cross-compression of the eighth nerve is the assumed mechanism.

AB31.7 Vertiginous syndromes

AB31.Y Other specified episodic vestibular syndrome

AB31.Z Episodic vestibular syndrome, unspecified

AB32 Chronic vestibular syndrome

A clinical syndrome of chronic vertigo, dizziness, or unsteadiness lasting months to years and generally including features suggestive of persistent vestibular system dysfunction (e.g., oscillopsia, nystagmus, gait unsteadiness). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Chronic vestibular syndrome often connotes a progressive, deteriorating course, but sometimes instead reflects a stable, incomplete recovery after an acute vestibular event, or persistent, lingering symptoms between episodic vestibular events.

AB32.0 Persistent Postural-Perceptual Dizziness

Persistent non-vertiginous dizziness, unsteadiness, or both lasting three months or more. Symptoms are present most days, often increasing throughout the day, but may wax and wane. Momentary flares may occur spontaneously or with sudden movement. Affected individuals feel worst when upright, exposed to moving or complex visual stimuli, and during active or passive head motion. These situations may not be equally provocative. Typically, the disorder follows occurrences of acute or episodic vestibular or balance-related problems. Symptoms may begin intermittently, and then consolidate. Gradual onset is uncommon.

AB32.1 Chronic unilateral idiopathic vestibulopathy

AB32.2 Persistent unilateral vestibulopathy after vestibular neuronitis

AB32.3 Unilateral vestibulopathy due to schwannoma

AB32.4 Unilateral vestibulopathy after medical intervention

AB32.5 Chronic bilateral vestibulopathy

Bilateral vestibulopathy (BVP) results from impaired vestibular function of both inner ears. It is clinically characterised by postural imbalance and unsteadiness of gait that worsens in darkness and on uneven ground, head or body movement-induced oscillopsia. If known, the etiology should be added to the diagnosis.

AB32.Y Other specified chronic vestibular syndrome

AB32.Z Chronic vestibular syndrome, unspecified

AB33 **Otosclerosis**

Otosclerosis is a genetically mediated metabolic bone disease that affects the otic capsule and stapes. It is an autosomal dominant disorder with varying penetrance and expressivity. Usually symptomatic hearing loss from otosclerosis develops early in the third decade of life, although onset in the teenage years does occur.

Inclusions: otospongiosis

AB34 **Disorders of vestibular function**

Exclusions: vertigo: NOS (MB48.0)

vertigo: epidemic (1C80-1C8Z)

AB34.0 Idiopathic bilateral vestibulopathy

This results as the culmination of damage done to both inner ears and causes problems in vision, hearing and motor coordination.

AB34.1 Other peripheral vertigo

AB34.Y Other specified disorders of vestibular function

AB34.Z Disorders of vestibular function, unspecified

AB35 **Labyrinthine fistula**

Labyrinthine fistula is a condition in which an abnormal communication is present between the perilymphatic space of the inner ear and the middle ear (usually at or adjacent to the round or oval window). The manifestations of this disease vary in severity and complexity, commonly ranging from very mild to incapacitating.

AB36 **Labyrinthine dysfunction**

AB37 **Noise effects on inner ear**

Noise toxicity can cause hearing loss, either transient or permanent, and impairment. Noise-induced hearing loss typically begins in the high-pitched frequency range of human voices communication.

Inclusions: Noise-induced hearing loss

AB3Y **Other specified diseases of inner ear**

AB3Z **Diseases of inner ear, unspecified**

Disorders with hearing impairment (AB50-AB5Z)

Exclusions: Otosclerosis (AB33)

AB50 **Congenital hearing impairment**

Both dominant and recessive genes exist which can cause mild to profound impairment. If a family has a dominant gene for deafness it will persist across generations because it will manifest itself in the offspring even if it is inherited from only one parent. If a family had genetic hearing impairment caused by a recessive gene it will not always be apparent as it will have to be passed onto offspring from both parents. Hearing impairment is sustained before the acquisition of language, which occurs due to a congenital condition.

AB50.0 Congenital conductive hearing loss

AB50.1 Congenital sensorineural hearing loss

AB50.2 Congenital mixed conductive and sensorineural hearing loss

AB50.Y Other specified congenital hearing impairment

AB50.Z Congenital hearing impairment, unspecified

AB51 **Acquired hearing impairment**

Loss of hearing that occurs sometime the course of life and is not present at birth. The hearing impairment is sustained after the acquisition of language, which can occur due to disease, trauma, or as a side-effect of a medicine. Conductive hearing loss may occur as a result of a problem in the outer or middle ear such as an obstruction (cerumen, foreign body), damage to the ossicles, middle ear infections, and/or perforation of the tympanic membrane. Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain. Mixed conductive and sensorineural hearing loss refers to a mix of both conductive and sensorineural hearing loss.

Exclusions: noise-induced hearing loss (AB37)

Ototoxic hearing loss (AB53)

Sudden idiopathic hearing loss (AB55)

deafness NOS (AB52)

Deaf mutism, not elsewhere classified (AB50-AB5Z)

AB51.0 Acquired conductive hearing loss

Conductive hearing loss occurs when there is a problem conducting sound waves anywhere along the route through the outer ear, tympanic membrane (eardrum), or middle ear (ossicles), bilateral.

AB51.1 Acquired sensorineural hearing loss

Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain.

AB51.2 **Acquired mixed conductive and sensorineural hearing loss**

Conductive hearing loss occurs when there is a problem conducting sound waves anywhere along the route through the outer ear, tympanic membrane (eardrum), or middle ear (ossicles). Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain. This diagnosis refers to a mix of both conductive and sensorineural hearing loss.

AB51.Y **Other specified acquired hearing impairment**

AB51.Z **Acquired hearing impairment, unspecified**

AB52 **Deafness not otherwise specified**

AB53 **Ototoxic hearing loss**

AB54 **Presbycusis**

The term presbycusis refers to sensorineural hearing impairment in elderly individuals. Characteristically, presbycusis involves bilateral high-frequency hearing loss associated with difficulty in speech discrimination and central auditory processing of information.

Inclusions: Presbyacusia

AB55 **Sudden idiopathic hearing loss**

AB56 **Hereditary hearing loss**

Exclusions: Congenital hearing impairment (AB50)

Acquired hearing impairment (AB51)

AB57 **Auditory synaptopathy or neuropathy**

Normal outer hair cell function but lacking synchrony of neural transmission of auditory information due to damage of inner hair cells or their synapses or of the spiral ganglion cells or of the auditory nerve

AB5Y **Other specified disorders with hearing impairment**

AB5Z **Disorders with hearing impairment, unspecified**

Disorders of ear, not elsewhere classified (AB70-AB7Y)

Exclusions: Tinnitus (MC41)

AB70 **Otalgia or effusion of ear**

Exclusions: Otitis media (AA80-AB0Z)

Chronic primary orofacial pain (MG30.03)

Chronic secondary headache or orofacial pain (MG30.6)

AB70.0 **Otorrhoea**

Exclusions: leakage of cerebrospinal fluid through ear (8D63)
Otorrhagia (AB70.1)

AB70.1 **Otorrhagia**

Exclusions: traumatic otorrhagia - code by type of injury. (Chapter 22)

AB70.2 **Otalgia**

Pain in one or both ears.

Exclusions: Chronic primary orofacial pain (MG30.03)
Chronic secondary headache or orofacial pain (MG30.6)

AB71 **Degenerative or vascular disorders of ear**

Exclusions: Presbycusis (AB54)

AB72 **Disorders of acoustic nerve**

Inclusions: Disorder of 8th cranial nerve

AB72.0 **Acoustic neuritis**

Coding Note: Code also the causing condition

AB72.Y **Other specified disorders of acoustic nerve**

AB72.Z **Disorders of acoustic nerve, unspecified**

AB73 **Atrophy ear**

AB7Y **Other specified disorders of ear, not elsewhere classified**

Postprocedural disorders of ear or mastoid process (AB90-AB93)

Coded Elsewhere: Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

AB90 **Recurrent cholesteatoma of postmastoidectomy cavity**

AB91 **Mucosal cyst of postmastoidectomy cavity**

AB92 **Granulation of postmastoidectomy cavity**

AB93 **Chronic inflammation of postmastoidectomy cavity**

AC0Y **Other specified diseases of the ear or mastoid process**

AC0Z **Diseases of the ear or mastoid process, unspecified**

CHAPTER 11

Diseases of the circulatory system

This chapter has 161 four-character categories.

Code range starts with BA00

This refers to diseases of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis.

Exclusions: Certain infectious or parasitic diseases (Chapter 01)

Certain conditions originating in the perinatal period (Chapter 19)

Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)

Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Endocrine, nutritional or metabolic diseases (Chapter 05)

Coded Elsewhere: Neoplasms of the circulatory system

Developmental anomalies of the circulatory system

Infections of the circulatory system

Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y)

Cerebrovascular diseases (8B00-8B2Z)

Functional vascular disorders of the skin (EG00-EG02)

Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

This chapter contains the following top level blocks:

- Hypertensive diseases
- Hypotension
- Ischaemic heart diseases
- Diseases of coronary artery
- Pulmonary heart disease or diseases of pulmonary circulation
- Pericarditis
- Acute or subacute endocarditis
- Heart valve diseases
- Diseases of the myocardium or cardiac chambers
- Cardiac arrhythmia

- Heart failure
- Diseases of arteries or arterioles
- Diseases of veins
- Disorders of lymphatic vessels or lymph nodes
- Postprocedural disorders of circulatory system
- Neoplasms of the circulatory system
- Developmental anomalies of the circulatory system
- Infections of the circulatory system

Hypertensive diseases (BA00-BA04.Z)

Although a continuous association exists between higher BP and increased cardiovascular disease risk, it is useful to categorize BP levels for clinical and public health decision making. Recent guidelines categorise systemic hypertension into 4 levels on the basis of average BP measured in a healthcare setting (office pressures):

• Normal: systolic BP <120mmHg and diastolic BP <80mmHg

• Elevated: systolic BP 120-129mmHg and diastolic BP <80mmHg

• Stage 1 hypertension: systolic BP 130-139mmHg or Diastolic BP 80-89mmHg

• Stage 2 hypertension: systolic BP 140mmHg or more, Diastolic BP 90mmHg or more

In children, systemic hypertension is defined as an average systolic or diastolic blood pressure equal or higher than the 95th percentile appropriate for the sex, age and height of the child.

The complications of uncontrolled or prolonged hypertension include damage to the blood vessels, heart, kidneys and brain.

Exclusions: Pulmonary hypertension (BB01)

involving coronary vessels (BA40-BA6Z)

Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z)

White coat hypertension (MC80.00)

Coded Elsewhere: Neonatal hypertension (KB45)

BA00 **Essential hypertension**

Essential (primary) hypertension, accounting for 95% of all cases of hypertension, is defined as high blood pressure for which a secondary cause cannot be found.

Inclusions: high blood pressure

Exclusions: Cerebrovascular diseases (8B00-8B2Z)

Background retinopathy and retinal vascular changes (9B78.1)

Coded Elsewhere: Pre-existing essential hypertension complicating pregnancy, childbirth or the puerperium (JA20.0)

BA00.0 Combined diastolic and systolic hypertension

BA00.1 **Isolated diastolic hypertension**

BA00.2 **Isolated systolic hypertension**

BA00.Y **Other specified essential hypertension**

BA00.Z **Essential hypertension, unspecified**

BA01 **Hypertensive heart disease**

Uncontrolled and prolonged hypertension can lead to a variety of changes in the myocardial structure, coronary vasculature, and conduction system of the heart. Hypertensive heart disease is a term applied generally to heart diseases, such as left ventricular hypertrophy, coronary artery disease, cardiac arrhythmias, and congestive heart failure, that are caused by direct or indirect effects hypertension.

Coded Elsewhere: Pre-existing hypertensive heart disease complicating pregnancy, childbirth or the puerperium (JA20.1)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

BA02 **Hypertensive renal disease**

Hypertensive renal disease is a medical condition referring to damage to the kidney due to chronic high blood pressure.

Inclusions: hypertensive nephropathy

Exclusions: Secondary hypertension (BA04)

Coded Elsewhere: Pre-existing hypertensive renal disease complicating pregnancy, childbirth or the puerperium (JA20.2)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

BA03 **Hypertensive crisis**

Coding Note: Code also the causing condition

BA04 **Secondary hypertension**

Defined through the measurement of the blood pressure using cuff method with a sitting systolic blood pressure above 140 mmHg or a sitting diastolic blood pressure above 90 mmHg in three consequent measurements with an identifiable cause.

Coding Note: Code also the causing condition

Exclusions: involving vessels of brain (8B00-8B2Z)

involving vessels of eye (9B78.1)

Coded Elsewhere: Congenital renal artery stenosis (LA90.40)

Hyperaldosteronism (5A72)

Pre-existing secondary hypertension complicating pregnancy, childbirth or the puerperium (JA20.4)

BA04.0 **Combined diastolic and systolic secondary hypertension**

BA04.1 **Isolated diastolic secondary hypertension**

BA04.2 **Isolated systolic secondary hypertension**

BA04.Y **Other specified secondary hypertension**

Coding Note: Code also the causing condition

BA04.Z **Secondary hypertension, unspecified**

Coding Note: Code also the causing condition

Hypotension (BA20-BA2Z)

Exclusions: cardiovascular collapse (MG40)
Nonspecific low blood-pressure reading (MC80.1)
Maternal hypotension syndrome (JA65.6)

Coded Elsewhere: Intracranial hypotension (8D61)
Neonatal hypotension (KB46)

BA20 **Idiopathic hypotension**

BA21 **Orthostatic hypotension**

Exclusions: Shy-Drager syndrome (8D87.0)

BA2Y **Other specified hypotension**

BA2Z **Hypotension, unspecified**

Ischaemic heart diseases (BA40-BA6Z)

Acute ischaemic heart disease (BA40-BA4Z)

Inclusions: acute coronary syndrome

BA40 **Angina pectoris**

Inclusions: Anginal syndrome
Ischaemic chest pain
Angina NOS

Exclusions: Otocephaly (LA23)

Coded Elsewhere: Microvascular angina (BA86)

BA40.0 **Unstable angina**

Inclusions: Preinfarction syndrome
worsening effort angina

BA40.1 **Stable angina**

BA40.Y **Other specified angina pectoris**

BA40.Z **Angina pectoris, unspecified**

BA41 **Acute myocardial infarction**

The term acute myocardial infarction (MI) should be used when there is evidence of myocardial necrosis in a clinical setting consistent with acute myocardial ischemia. Under these conditions any one of the following criteria meets the diagnosis for MI;

Detection of a rise and/or fall of cardiac biomarker values with at least one value above the 99th percentile upper reference limit (URL) and with at least one of the following;

a. Symptoms of ischaemia.

b. New or presumed new significant ST-segment-T wave (ST-T) changes or new left bundle branch block (LBBB).

c. Development of pathologic Q waves in the ECG.

d. Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality.

e. Identification of an intracoronary thrombus by angiography or autopsy.

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction (WHO)

Exclusions: postmyocardial infarction syndrome (BA60.0)

Subsequent myocardial infarction (BA42)

Certain current complications following acute myocardial infarction (BA60)

Old myocardial infarction (BA50)

BA41.0 Acute ST elevation myocardial infarction

STEMI is an acute myocardial infarction with developing ST elevation in two contiguous leads. The criteria of ST elevation is follows; New ST elevation at the J point in two contiguous leads with the cut-points apply: 0.2mV in men>40 years; >0.25mV in men<40 years, or >0.15 mV in women.

BA41.1 Acute non-ST elevation myocardial infarction

BA41.Z Acute myocardial infarction, unspecified

BA42 **Subsequent myocardial infarction**

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction

Inclusions: extension of myocardial infarction

recurrent myocardial infarction

Exclusions: specified as chronic or with a stated duration of more than 4 weeks (more than 28 days) from onset (BA50)

BA42.0 Subsequent myocardial infarction, ST elevation myocardial infarction

Extension or recurrent myocardial infarction. This category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from total occlusion of the culprit coronary artery.

BA42.1 **Subsequent myocardial infarction, non-ST elevation myocardial infarction**

Extension or recurrent myocardial infarction. For morbidity coding, this category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from severe obstruction, but not total occlusion, of the culprit coronary artery.

BA42.Z **Subsequent myocardial infarction, unspecified**

BA43 Coronary thrombosis not resulting in myocardial infarction

Superimposed thrombus associated with plaque rupture or erosion which does not obstruct the coronary flow to cause myocardial infarction.

Inclusions: Occlusion of coronary artery or vein not resulting in myocardial infarction

Embolism of coronary artery or vein not resulting in myocardial infarction

Thromboembolism of coronary artery or vein not resulting in myocardial infarction

BA4Z Acute ischaemic heart disease, unspecified

Chronic ischaemic heart disease (BA50-BA5Z)

Chronic heart disease is seen due to the atherosclerosis. of coronary arteries. It is characterised by angina pectoris and unstable angina.

BA50 Old myocardial infarction

Past myocardial infarction diagnosed by ECG or other special investigation, but currently presenting no symptoms.

Inclusions: healed myocardial infarction

BA51 Ischaemic cardiomyopathy

Ischaemic cardiomyopathy has been defined as left ventricular systolic dysfunction with one or more of the following: a history of prior myocardial revascularisation or myocardial infarction, more than 75% stenosis in the left main stem or left anterior descending artery, or two vessels or more with a greater than 75% stenosis. It consists of a spectrum of pathophysiological states that relate to perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.

BA51.0 **Dilated cardiomyopathy due to congenital anomaly of coronary artery**

Dilated cardiomyopathy due to a congenital anomaly of one or more coronary arteries, such as anomalous left coronary artery from pulmonary artery (ALCAPA), coronary ostial stenosis or atresia, right ventricular dependent coronary circulation in pulmonary atresia with an intact ventricular septum. It is a form of ischaemic cardiomyopathy causing systolic ventricular dysfunction that relates to a spectrum of perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.

BA51.Y **Other specified ischaemic cardiomyopathy**

BA51.Z **Ischaemic cardiomyopathy, unspecified**

BA52 Coronary atherosclerosis

Atherosclerosis is the build up inside the coronary arteries of cholesterol, fatty acids, calcium, fibrous connective tissue and cells (mostly macrophages), referred to as plaque. The effect of this is to reduce the blood flow through the coronary arteries to heart muscle and when marked results in heart damage often with symptoms such as chest pain.

Inclusions: Coronary artery atherosclerosis

Coronary artery atheroma

Coronary artery sclerosis

coronary artery ostial stenosis due to atherosclerosis

BA52.0 **Coronary atherosclerosis of native coronary artery**

Atherosclerotic lesions, or atherosclerotic plaques of native coronary artery.

Inclusions: Coronary atherosclerosis without significant ischaemia of native coronary artery

BA52.1 **Coronary atherosclerosis of autologous bypass graft**

Atherosclerotic lesions, or atherosclerotic plaques of autologous bypass graft.

Inclusions: Coronary atherosclerosis of autologous bypass graft without significant ischaemia

BA52.10 Coronary atherosclerosis of arterial autologous bypass graft

BA52.11 Coronary atherosclerosis of venous autologous bypass graft

BA52.1Z Coronary atherosclerosis of unspecified autologous bypass graft

BA52.2 **Coronary atherosclerosis of non-autologous bypass graft**

Atherosclerotic lesions, or atherosclerotic plaques of non-autologous bypass graft.

Inclusions: Coronary atherosclerosis without significant ischaemia of non-autologous bypass graft

BA52.Z **Coronary atherosclerosis, unspecified site**

BA5Y Other specified chronic ischaemic heart disease

BA5Z Chronic ischaemic heart disease, unspecified

BA60 Certain current complications following acute myocardial infarction

Secondary conditions which may occur in the course after the heart attack. They include pericarditis, arrhythmia, cardiogenic shock, heart failure, ventricular rupture, ventricular aneurysm (with thrombus) and recurrent infarction.

Exclusions: the listed conditions, when: not specified as current complications following acute myocardial infarction (Chapter 11)

the listed conditions, when: concurrent with acute myocardial infarction (BA41)

BA60.0 Dressler syndrome

A condition of postmyocardial infarction (1 to 8 weeks), characterised by a set of associated symptom, including malaise, fever, pericardial discomfort, leukocytosis, an elevated sedimentation rate, and a pericardial effusion. Patients with this syndrome usually demonstrate localised fibrous pericarditis containing polymorphonuclear leukocytes.

Inclusions: Postmyocardial infarction syndrome

BA60.1 Other pericarditis as current complication following acute myocardial infarction

An inflammation of the pericardium that can produce chest pain, which occurs as early as the first day and as late as 6 weeks after acute myocardial infarction. The pain of pericarditis radiates to either trapezius ridge. Transmural myocardial infarction is responsible for local pericardial inflammation. Transient pericardial friction rubs are relatively common in patients with transmural infarction within the first 48 hours. An acute fibrinous pericarditis occurs commonly after transmural infarction, whereas the risk of haemorrhagic pericarditis is increased by anticoagulation.

BA60.2 Ventricular aneurysm as current complication following acute myocardial infarction

A discrete dyskinetic area of the left ventricular wall with a broad neck after acute myocardial infarction. The wall of the true aneurysm is thinner than the rest of the left ventricle; it is usually composed of fibrous tissue and necrotic muscle, occasionally mixed with viable myocardium. In contrast, pseudoaneurysms are composed of organised hematoma and pericardium and lack any elements of the original myocardial wall.

BA60.3 Ventricular septal defect as current complication following acute myocardial infarction

A mechanical rupture of the interventricular septum after S-T elevation myocardial infarction resulting in the left-to-right shunt to deteriorate hemodynamic, which confers a high 30-day mortality. Rupture of the septum with an anterior infarction tends to be apical in location, whereas inferior infarctions are associated with perforation of the basal septum.

BA60.4 Cardiac rupture as current complication following acute myocardial infarction

A tearing of acutely infarcted tissue after acute myocardial infarction, which may involve the papillary muscles, interventricular septum, or free wall of either ventricle.

BA60.5 Pulmonary embolism as current complication following acute myocardial infarction

A pulmonary embolism that resulted from thrombi in the veins of the lower extremities (e.g. after prolonged periods of bed rest) or mural thrombi overlying an area of right ventricular infarction after acute myocardial infarction.

Exclusions: Mural thrombus as current complication following acute myocardial infarction (BA60.7)

BA60.6 Rupture of papillary muscle or chordae tendineae as current complication following acute myocardial infarction

BA60.7 **Mural thrombus as current complication following acute myocardial infarction**

A blood clot formed on the endoventricle or endoatirium, usually overlying dyskinetic or akinetic area of the ventricular infarction after acute myocardial infarction.

Exclusions: Pulmonary embolism as current complication following acute myocardial infarction (BA60.5)

BA60.8 **Arrhythmia as current complication following acute myocardial infarction**

A large and heterogeneous group of conditions in which the heart beats with an irregular or abnormal rhythm that can complicate the course of patients with acute myocardial infarction.

BA60.9 **Cardiogenic shock, unrelated to mechanical complications, as current complication following acute myocardial infarction**

The most severe clinical expression of left ventricular failure and is associated with extensive damage to the left ventricular myocardium after acute myocardial infarction, unrelated to a mechanical defect such as ventricular septal or papillary muscle rupture. Shock is defined as systolic BP < 90 mmHg and organ hypoperfusion.

BA60.Y **Other specified current complications following acute myocardial infarction**

BA60.Z **Certain current complications following acute myocardial infarction, unspecified**

BA6Z **Ischaemic heart diseases, unspecified**

Diseases of coronary artery (BA81-BA8Z)

Conditions affecting the blood perfusion of the heart.

Coded Elsewhere: Coronary atherosclerosis (BA52)

Cardiac transplant associated coronary allograft vasculopathy (BE1A)

BA81 **Coronary artery aneurysm**

Coronary dilatation which exceeds the diameter of normal adjacent segments or the diameter of the patient's largest coronary vessel by 1.5 times.

Exclusions: Congenital coronary arterial aneurysm (LA8C)

Mucocutaneous lymph node syndrome (4A44.5)

BA81.0 **Coronary artery aneurysm with perforation**

BA81.1 **Coronary artery aneurysm with rupture**

BA81.2 **Coronary artery aneurysm without mention of perforation or rupture**

BA82 **Coronary artery dissection**

Coronary artery dissection results from a tear in the inner layer of the coronary artery, the tunica intima. This allows blood to penetrate and cause an intramural hematoma in the central layer, the tunica media, and restriction in the size of lumen.

Inclusions: spontaneous coronary artery dissection

Exclusions: Injury or harm arising from a procedure, not elsewhere classified (NE81)

Injury of blood vessels of thorax (NB30)

BA83 **Coronary artery fistula, acquired**

Abnormal communication between a coronary artery and a cardiac chamber or major vessels, acquired after coronary or heart surgery, coronary angioplasty, rupture or coronary artery aneurysm or injury to the heart.

BA84 **Chronic total occlusion of coronary artery**

A chronic total occlusion of coronary artery is defined as the complete obstruction of a coronary artery or coronary arteries, exhibiting a TIMI flow score of zero or one, with an occlusion duration of greater than 3 months.'

Coding Note: Code also the causing condition

Exclusions: Acute myocardial infarction (BA41)

BA85 **Coronary vasospastic disease**

The term coronary vasospastic disease refers to a sudden, intense vasoconstriction of an epicardial coronary artery that causes vessel occlusion or near occlusion. Although it may be involved in other coronary syndromes, it represents the usual cause of variant angina.

BA85.0 Silent coronary vasospastic disease

The feature of this is the frequency of asymptomatic ischemic episodes in coronary vasospastic disease.

BA85.Y Other specified coronary vasospastic disease

BA85.Z Coronary vasospastic disease, unspecified

BA86 **Coronary microvascular disease**

BA8Y **Other specified diseases of coronary artery**

BA8Z **Diseases of coronary artery, unspecified**

Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z)

BB00 **Pulmonary thromboembolism**

Exclusions: Complications following abortion, ectopic or molar pregnancy (JA05)

Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

BB00.0 **Acute pulmonary thromboembolism**

Acute pulmonary thromboembolism is defined as a partial or complete occlusion of a pulmonary arterial branch with the abrupt onset of related symptoms, such as dyspnoea, tachypnoea, chest pain, cough and blood-tinged sputum. However, acute pulmonary embolism may also occur in the absence of any symptoms.

BB00.1 **Chronic pulmonary thromboembolism**

Chronic pulmonary thromboembolism is defined as a partial or complete occlusion of at least one major pulmonary arterial branch in the presence of a mean pulmonary artery pressure 25mmHg at rest, and normal left ventricular filling pressures, despite effective coagulation over at least three months.

Coded Elsewhere: Chronic thromboembolic pulmonary hypertension (BB01.3)

BB00.Z **Pulmonary thromboembolism, unspecified**

BB01 Pulmonary hypertension

Pulmonary hypertension (PH) is a haemodynamic and pathophysiological condition defined as an increase in mean pulmonary arterial pressure (PAP) 25 mmHg at rest as assessed by right heart catheterization. PH can be found in multiple clinical conditions.

Coded Elsewhere: Persistent pulmonary hypertension of the newborn (KB42)

BB01.0 **Pulmonary arterial hypertension**

Pulmonary arterial hypertension is a clinical condition characterised by the presence of pre-capillary pulmonary hypertension in the absence of other causes of pre-capillary pulmonary hypertension, such as due to lung diseases, chronic thromboembolic pulmonary hypertension, or other rare diseases. It includes different forms that share a similar clinical picture and virtually identical pathological changes of the lung microcirculation.

Inclusions: primary pulmonary hypertension

BB01.1 **Pulmonary hypertension due to left heart disease**

BB01.2 **Pulmonary hypertension due to lung disease or hypoxia**

BB01.3 **Chronic thromboembolic pulmonary hypertension**

Chronic thromboembolic pulmonary hypertension (CTEPH) is characterised by the persistence of thromboemboli in the form of organised tissue obstructing the pulmonary arteries. The consequence is an increase in pulmonary vascular resistance (PVR) resulting in pulmonary hypertension (PH) and progressive right heart failure.

BB01.4 **Pulmonary hypertension with multifactorial mechanism**

Coding Note: Code also the causing condition

BB01.5 **Cor pulmonale**

Cor pulmonale refers to the altered structure and/or impaired function of the right ventricle that results from pulmonary hypertension associated with diseases of the lung, upper airway, or chest wall.

Coding Note: Code also the causing condition

BB01.Z **Pulmonary hypertension, unspecified**

BB02 **Certain specified diseases of pulmonary vessels**

This definition includes Arteriovenous fistula of pulmonary vessels, Aneurysm of pulmonary artery and Other specified diseases of pulmonary vessels.

BB02.0 **Arteriovenous fistula of pulmonary vessels**

BB02.1 **Aneurysm of pulmonary artery**

Aneurysm of pulmonary artery is an abnormal dilatation of part of the pulmonary artery

BB02.10 Aneurysm of pulmonary artery with perforation

BB02.11 Aneurysm of pulmonary artery with rupture

BB02.12 Aneurysm of pulmonary artery without mention of perforation or rupture

BB02.1Y Other specified aneurysm of pulmonary artery

BB02.1Z Aneurysm of pulmonary artery, unspecified

BB02.2 **Rupture of pulmonary vessels**

This is defined as the tearing apart of the pulmonary vessels allowing blood to escape outside.

BB02.3 **Acquired pulmonary arterial tree abnormality**

A postnatal pathological change in form or function of the pulmonary arterial tree.

Coded Elsewhere: Postprocedural pulmonary trunk stenosis (BE15.0)
Postprocedural right pulmonary artery stenosis (BE15.1)
Postprocedural pulmonary arterial tree disorder (BE15)

BB03 **Acquired pulmonary venous abnormality**

A postnatal pathological change in form or function of one or more pulmonary veins.

Coded Elsewhere: Postprocedural pulmonary venous disorder (BE16)

BB03.0 **Acquired pulmonary venous obstruction**

A postnatal pathologic condition of one or more pulmonary vein(s) in which flow is impeded or blocked due to narrowing or atresia.

BB03.Y **Other specified acquired pulmonary venous abnormality**

BB03.Z **Acquired pulmonary venous abnormality, unspecified**

BB0Y **Other specified pulmonary heart disease or diseases of pulmonary circulation**

BB0Z **Pulmonary heart disease or diseases of pulmonary circulation, unspecified**

Pericarditis (BB20-BB2Z)

Coded Elsewhere: Pneumopericardium originating in the perinatal period (KB27.3)

Acute rheumatic pericarditis (1B41.0)

BB20 Acute pericarditis

Acute pericarditis is defined as pericardial inflammation of no more than 1 to 2 weeks duration.

Coding Note: Code also the causing condition

Inclusions: acute pericardial effusion

Exclusions: Acute rheumatic pericarditis (1B41.0)

BB20.0 Infectious pericarditis

A disease of the pericardium, caused by a secondary infection with a bacterial, viral, or fungal source. This disease is characterised by fever, odynophagia, cough, fatigue, or chest pain. Confirmation is by identification of the bacterial, viral, or fungal agent in a blood sample.

Coding Note: Code also the causing condition

Inclusions: Pyopericarditis

BB20.1 Neoplastic pericarditis

Coding Note: Code also the causing condition

BB20.2 Myopericarditis

Inclusions: Perimyocarditis

BB20.Y Other specified acute pericarditis

Coding Note: Code also the causing condition

BB20.Z Acute pericarditis, unspecified

Coding Note: Code also the causing condition

BB21 Chronic rheumatic pericarditis

Inflammation of the pericardium and of the surrounding mediastinal cellular tissue resulted from rheumatic etiology.

BB22 Constrictive pericarditis

Chronic fibrous pericarditis due to the presence of dense fibrous tissue between the parietal and visceral layers of pericardium and neighbouring structures.

Inclusions: Concretio cordis

BB23 Cardiac tamponade

Cardiac tamponade is a clinical syndrome caused by the accumulation of fluid in the pericardial space, resulting in reduced ventricular filling and subsequent hemodynamic compromise. Cardiac tamponade is a medical emergency, the complications of which include shock, and death.

BB24 **Haemopericardium**

This is hemopericardium caused by diseases not elsewhere classified. Hemopericardium generally refers to blood in the pericardial sac of the heart. It is clinically similar to a pericardial effusion, and, depending on the volume and rapidity with which it develops, may cause cardiac tamponade.

BB25 **Pericardial effusion**

Pericardial effusion is an abnormal accumulation of fluid in the pericardial sac. Noninflammatory diseases such as chronic renal failure, circulatory congestion, hypothyroidism and amyroidosis can cause pericardial effusion.

BB2Y **Other specified pericarditis**

Coding Note: Code also the causing condition

BB2Z **Pericarditis, unspecified**

Coding Note: Code also the causing condition

Acute or subacute endocarditis (BB40-BB4Z)

A condition characterised by inflammation of endocardium

Coded Elsewhere: Acute rheumatic endocarditis (1B41.1)
Systemic lupus erythematosus with cardiac involvement (4A40.0Y)
Typhoid fever with heart involvement (1A07.Y)

BB40 **Acute or subacute infectious endocarditis**

Coding Note: Code also the causing condition

Exclusions: Infectious myocarditis (BC42.1)

Coded Elsewhere: Endocardial fibroelastosis (BC43.3)
Syphilitic endocarditis (1A62.1)
Tuberculosis of endocardium (1B12.0)

BB41 **Myoendocarditis**

Exclusions: Infectious myocarditis (BC42.1)

BB42 **Periendocarditis**

BB4Y **Other specified acute or subacute endocarditis**

Coding Note: Code also the causing condition

BB4Z **Acute or subacute endocarditis, unspecified**

Coding Note: Code also the causing condition

Heart valve diseases (BB60-BC0Z)

Exclusions: Congenital anomaly of a ventriculo-arterial valve or adjacent regions (LA8A)

Atypical truncal valve (LA85.4)

Acute rheumatic fever (1B40-1B42)

Structural developmental anomalies of the circulatory system (LA80-LA9Z)

Mitral valve disease (BB60-BB6Z)

This is a disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle through the mitral valve into the left atrium when the left ventricle contracts. Simply put, there is regurgitation of blood back into the left atrium.

Exclusions: Congenital anomaly of mitral valve (LA87.1)

Coded Elsewhere: Injury to mitral valve (NB31.40)

BB60 **Mitral valve stenosis**

Exclusions: Mitral valve stenosis with insufficiency (BB63)

Coded Elsewhere: Postprocedural mitral valve stenosis (BE12.0)

BB60.0 Rheumatic mitral valve stenosis

Mitral stenosis refers to narrowing of the mitral valve orifice, resulting in impedance of filling of the left ventricle in diastole. It is usually caused by rheumatic heart disease.

BB60.1 Nonrheumatic mitral valve stenosis

Mitral stenosis is narrowing of the passage through the mitral valve due to fibrosis, and calcinosis in the leaflets and chordal areas.

The most common reason of mitral stenosis is rheumatic fever. Except rheumatic fever; SLE, Malignant Sarcoid, Active Infective Endocarditis, Gout Whipple's Disease, Massive Annular calcification cause to the mitral stenosis.

Exclusions: Postprocedural mitral valve stenosis (BE12.0)

BB60.Z Mitral valve stenosis, unspecified

BB61 **Mitral valve insufficiency**

Mitral insufficiency is a clinical condition which mitral valve can't close properly. It is the antidromic leaking of blood from the left ventricle through the mitral valve, and into the left atrium.

Exclusions: Mitral valve stenosis with insufficiency (BB63)

Coded Elsewhere: Postprocedural mitral valve insufficiency (BE12.1)

Mitral valve insufficiency due to acute myocardial infarction (BA60.6)

BB61.0 **Rheumatic mitral valve insufficiency**

Mitral insufficiency can be caused by conditions such as rheumatic fever.

Mitral insufficiency is leakage of blood from the left ventricle into the left atrium during systole.

BB61.Y **Other specified mitral valve insufficiency**

BB61.Z **Mitral valve insufficiency, unspecified**

BB62 **Mitral valve prolapse**

Inclusions: floppy mitral valve syndrome

Exclusions: Marfan syndrome (LD28.01)

BB62.0 **Rheumatic mitral valve prolapse**

This is a rheumatic valvular heart disease characterised by the displacement of an abnormally thickened mitral valve leaflet into the left atrium during systole.

BB62.1 **Degenerative mitral valve prolapse**

This is a degenerative valvular heart disease characterised by the displacement of an abnormally thickened mitral valve leaflet into the left atrium during systole.

BB62.Y **Other specified nonrheumatic mitral valve prolapse**

BB62.Z **Mitral valve prolapse, unspecified**

BB63 **Mitral valve stenosis with insufficiency**

This is a valvular heart disease characterised by the narrowing of the orifice of the mitral valve of the heart, with regurgitation.

BB63.0 **Rheumatic mitral stenosis with insufficiency**

Mitral stenosis and mitral insufficiency occur in patients with rheumatic heart disease.

BB63.1 **Nonrheumatic mitral stenosis with insufficiency**

This is a non-rheumatic valvular heart disease characterised by the narrowing of the orifice of the mitral valve of the heart, with regurgitation.

BB63.Z **Mitral valve stenosis with insufficiency, unspecified**

BB64 **Mitral valvar abscess**

BB65 **Mitral valve rupture**

Exclusions: Rupture of papillary muscle or chordae tendineae as current complication following acute myocardial infarction (BA60.6)

BB6Y **Other specified mitral valve disease**

BB6Z **Mitral valve disease, unspecified**

Exclusions: Congenital anomaly of aortic valve (LA8A.2)

Coded Elsewhere: Traumatic injury to aortic valve (NB31.4Y)

Dysplasia of aortic valve (LA8A.2Y)

BB70 Aortic valve stenosis

Aortic valve stenosis is abnormal narrowing of the aortic valve. This decreases the blood flow from heart to organs.

Exclusions: Congenital supravalvar aortic stenosis (LA8A.3)

Congenital subaortic stenosis (LA8A.5)

Coded Elsewhere: Postprocedural aortic valve stenosis (BE12.2)

BB70.0 Rheumatic aortic valve stenosis

Aortic stenosis occur scarring of the aortic valve due to rheumatic fever as a child or young adult. In aortic stenosis, the aortic valve does not open fully. This decreases blood flow from the heart.

BB70.1 Nonrheumatic aortic valve stenosis

Exclusions: Postprocedural aortic valve stenosis (BE12.2)

Coded Elsewhere: Stenosis of the neoaortic valve of pulmonary origin (BC02.30)

BB70.Y Other specified aortic valve stenosis

BB70.Z Aortic valve stenosis, unspecified

BB71 Aortic valve insufficiency

Aortic valve insufficiency results from leakage and backflow of blood that is ejected from the left ventricle into the ascending aorta back into the left ventricle.

Coding Note: Code also the causing condition

Coded Elsewhere: Postprocedural aortic valve insufficiency (BE12.3)

Insufficiency of the neoaortic valve of pulmonary origin (BC02.31)

BB71.0 Rheumatic aortic valve insufficiency

Aortic insufficiency is the leaking of the aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle. Rheumatic fever cause the cuspis retraction.

Inclusions: rheumatic aortic incompetence

rheumatic aortic regurgitation

BB71.Y Other specified nonrheumatic aortic valve insufficiency

Coding Note: Code also the causing condition

BB71.Z Aortic valve insufficiency, unspecified

Coding Note: Code also the causing condition

BB72 Aortic valve stenosis with insufficiency

BB72.0 **Rheumatic aortic stenosis with insufficiency**

Aortic stenosis from chronic rheumatic heart disease is typically associated with aortic insufficiency. The valve commissures and cuspis become adherent and fused, and the valve orifice becomes small. Upon auscultation, S2 may be single because the aortic leaflets are immobile and do not produce an aortic closure sound

BB72.1 **Nonrheumatic aortic valve stenosis with insufficiency**

This is a non-rheumatic disease of the heart valves in which the opening of the aortic valve is narrowed, with regurgitation.

BB72.Z **Aortic valve stenosis with insufficiency, unspecified**

BB73 Aortic valvar abscess

BB74 Aortic valvar prolapse

A congenital cardiovascular malformation of the aortic valve in which part or all of one or more of the aortic valve leaflets is on the ventricular side of the plane of the inferior aspect of the attachments of the aortic valve leaflets.

BB7Y Other specified aortic valve disease

BB7Z Aortic valve disease, unspecified

Tricuspid valve disease (BB80-BB8Z)

Exclusions: Congenital anomaly of tricuspid valve (LA87.0)

Coded Elsewhere: Traumatic injury to tricuspid valve (NB31.4Y)

BB80 Tricuspid valve stenosis

This is a valvular heart disease which results in the narrowing of the orifice of the tricuspid valve of the heart. It is a relatively rare condition that causes stenosis-increased resistance to blood flow through the valve.

Coded Elsewhere: Postprocedural tricuspid valve stenosis (BE12.4)

BB80.0 **Rheumatic tricuspid valve stenosis**

Tricuspid stenosis is almost always rheumatic in origin. Tricuspid stenosis results in the narrowing of the orifice of the tricuspid valve of the heart.

BB80.Y **Other specified nonrheumatic tricuspid valve stenosis**

BB80.Z **Tricuspid valve stenosis, unspecified**

BB81 Tricuspid valve insufficiency

This refers to the failure of the heart's tricuspid valve to close properly during systole. As a result, with each heart beat some blood passes from the right ventricle to the right atrium, the opposite of the normal direction.

Coded Elsewhere: Postprocedural tricuspid valve insufficiency (BE12.5)

BB81.0 **Rheumatic tricuspid valve insufficiency**

BB81.Y **Other specified nonrheumatic tricuspid valve insufficiency**

BB81.Z **Tricuspid valve insufficiency, unspecified**

BB82 **Tricuspid valve stenosis with insufficiency**

This is a valvular heart disease which results in the narrowing of the orifice of the tricuspid valve of the heart. It is a relatively rare condition that causes stenosis-increased resistance to blood flow through the valve, with regurgitation.

BB82.0 **Rheumatic tricuspid valve stenosis with insufficiency**

Tricuspid valve insufficiency due to leaflet abnormalities may be secondary to rheumatic heart disease. When due to the latter, it generally occurs in combination with tricuspid stenosis

BB82.Y **Other specified nonrheumatic tricuspid valve stenosis with insufficiency**

BB82.Z **Tricuspid valve stenosis with insufficiency, unspecified**

BB83 **Tricuspid valvular abscess**

BB84 **Tricuspid valve rupture**

BB8Y **Other specified tricuspid valve disease**

BB8Z **Tricuspid valve disease, unspecified**

Pulmonary valve disease (BB90-BB9Z)

Exclusions: Congenital anomaly of pulmonary valve (LA8A.0)

Coded Elsewhere: Traumatic injury to pulmonary valve (NB31.4Y)

BB90 **Pulmonary valve stenosis**

Pulmonary valve stenosis is an obstruction at the level of pulmonary valve which impedes the outflow of blood from right ventricle to pulmonary artery.

Coded Elsewhere: Postprocedural pulmonary valve stenosis (BE12.6)

BB90.0 **Rheumatic pulmonary valve stenosis**

This is a rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve.

BB90.Y **Other specified nonrheumatic pulmonary valve stenosis**

BB90.Z **Pulmonary valve stenosis, unspecified**

BB91 **Pulmonary valve insufficiency**

Pulmonary valve insufficiency which is an incomplete closure of the pulmonary valve allows blood to return from pulmonary artery into the right ventricle.

Coded Elsewhere: Postprocedural pulmonary valve insufficiency (BE12.7)

Neopulmonary valve regurgitation (BE14.41)

BB91.0 **Rheumatic pulmonary valve insufficiency**

This is a rheumatic condition where the pulmonary valve is not strong enough to prevent backflow to the right ventricle.

BB91.Y **Other specified nonrheumatic pulmonary valve insufficiency**

BB91.Z **Pulmonary valve insufficiency, unspecified**

BB92 **Pulmonary valve stenosis with insufficiency**

It is a clinical condition pulmonary valve stenosis and pulmonary sufficiency are seen together

BB92.0 **Rheumatic pulmonary valve stenosis with insufficiency**

This is a rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve, with regurgitation.

BB92.1 **Nonrheumatic pulmonary valve stenosis with insufficiency**

This is a non-rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve, with regurgitation.

BB92.Z **Pulmonary valve stenosis with insufficiency, unspecified**

BB93 **Pulmonary valvar abscess**

BB9Y **Other specified pulmonary valve disease**

BB9Z **Pulmonary valve disease, unspecified**

BC00 **Multiple valve disease**

Coding Note: When specific type of valve disease is known, assign codes for the specific conditions.

BC01 **Prosthetic valve disease**

Coding Note: When specific type of valve disease is known, assign codes for the specific conditions.

Coded Elsewhere: Infection or inflammatory reaction of heart valve prosthesis NOS (NE83.1)

BC02 **Acquired abnormality of congenitally malformed valve**

A postnatal pathological change in form or function of a congenitally malformed valve.

Exclusions: Congenital anomaly of aortic valve (LA8A.2)

Congenital anomaly of mitral valve (LA87.1)

Congenital anomaly of pulmonary valve (LA8A.0)

Congenital anomaly of tricuspid valve (LA87.0)

Coded Elsewhere: Endocarditis of common atrioventricular valve (BB40)

Endocarditis of right atrioventricular valve (BB40)

Endocarditis of left atrioventricular valve (BB40)

Endocarditis of the neoaortic valve of pulmonary origin (BB40)

Endocarditis of neopulmonary valve (BB40)

BC02.0 **Acquired common atrioventricular valvar abnormality in biventricular connections**

A postnatal pathological change in form or function of the common atrioventricular valve in the presence of biventricular atrioventricular connections.

BC02.1 **Acquired truncal valvar abnormality**

A postnatal pathological change in form or function of the truncal valve when the truncal valve supplies both the systemic and pulmonary circulations.

Coded Elsewhere: Endocarditis of truncal valve or neo-aortic valve of truncal origin (BB40)

BC02.2 **Acquired common atrioventricular valvar abnormality in double inlet ventricle**

Coded Elsewhere: Postprocedural common atrioventricular valvar abnormality in double-inlet ventricle (BE14.7)

Postprocedural right-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.5)

Postprocedural left-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.6)

BC02.3 **Acquired abnormality of neoaortic valve of pulmonary origin**

BC02.30 Stenosis of the neoaortic valve of pulmonary origin

Acquired obstruction to flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation

BC02.31 Insufficiency of the neoaortic valve of pulmonary origin

Acquired backward flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation.

BC02.3Y Other specified acquired abnormality of neoaortic valve of pulmonary origin

BC02.3Z Acquired abnormality of neoaortic valve of pulmonary origin, unspecified

BC02.4 **Acquired abnormality of the neoaortic valve of truncal origin**

A postnatal pathological change in form or function of the neo-aortic valve that results from biventricular repair of common arterial trunk (truncus arteriosus)

BC02.40 Acquired stenosis of the neoaortic valve of truncal origin

Acquired obstruction to flow through the neo-aortic valve, when the neo-aortic valve results from biventricular repair of common arterial trunk (truncus arteriosus)

BC02.41 Acquired regurgitation of the neoaortic valve of truncal origin

Acquired backward flow through the neo-aortic valve, when the neo-aortic valve results from biventricular repair of common arterial trunk (truncus arteriosus)

BC02.4Y Other specified acquired abnormality of the neoaortic valve of truncal origin

BC02.4Z Acquired abnormality of the neoaortic valve of truncal origin, unspecified

BC02.Y **Other specified acquired abnormality of congenitally malformed valve**

BC02.Z **Acquired abnormality of congenitally malformed valve, unspecified**

BC0Z **Heart valve diseases, unspecified**

BC20 **Chronic rheumatic heart diseases, not elsewhere classified**

Coded Elsewhere: Acute rheumatic fever with heart involvement (1B41)
Rheumatic mitral valve stenosis (BB60.0)
Rheumatic mitral valve insufficiency (BB61.0)
Rheumatic mitral valve prolapse (BB62.0)
Rheumatic mitral stenosis with insufficiency (BB63.0)
Rheumatic aortic valve stenosis (BB70.0)
Rheumatic aortic valve insufficiency (BB71.0)
Rheumatic aortic stenosis with insufficiency (BB72.0)
Rheumatic tricuspid valve stenosis (BB80.0)
Rheumatic tricuspid valve insufficiency (BB81.0)
Rheumatic tricuspid valve stenosis with insufficiency (BB82.0)
Rheumatic pulmonary valve stenosis (BB90.0)
Rheumatic pulmonary valve insufficiency (BB91.0)
Rheumatic pulmonary valve stenosis with insufficiency (BB92.0)

BC20.0 **Rheumatic diseases of endocardium, valve unspecified**
Endocardium and valves are affected to varying degrees due to rheumatic process.

BC20.1 **Rheumatic heart disease, unspecified**

BC20.Y **Other specified chronic rheumatic heart disease**

BC20.Z **Chronic rheumatic heart disease, unspecified**

Diseases of the myocardium or cardiac chambers (BC40-BC4Z)

This refers to diseases of a type of involuntary striated muscle found in the walls and histological foundation of the heart, with specific reference to the atrial and ventricular chambers, as well as the myocardium itself.

BC40 **Acquired atrial abnormality**

A postnatal pathological change in form or function of one or both atriums.

Coded Elsewhere: Postprocedural residual or recurrent interatrial communication (BE17)

Postprocedural right atrial complication (BE1E)

Postprocedural left atrial complication (BE1F)

BC40.0 Acquired interatrial communication

A postnatal pathological hole or pathway between the atrial chambers.

BC40.Y Other specified acquired atrial abnormality

BC40.Z Acquired atrial abnormality, unspecified

BC41 **Acquired ventricular abnormality**

A postnatal pathological change in form or function of a ventricle.

Coded Elsewhere: Postprocedural ventricular septal defect disorder (BE14.8)

BC41.0 Acquired interventricular communication

Hole or pathway between the ventricular chambers not present at birth.

Coded Elsewhere: Ventricular septal defect as current complication following acute myocardial infarction (BA60.3)

BC41.Y Other specified acquired ventricular abnormality

BC41.Z Acquired ventricular abnormality, unspecified

BC42 **Myocarditis**

Myocarditis (inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to either discrete infectious external antigens such as viruses, bacteria, fungae or parasites; non-infectious external antigens such as hypersensitivity to drugs; or internal non-infectious triggers such as autoimmune or hypersensitive activation against self-antigens.

Additional information: The classic Dallas criteria for the pathological diagnosis of myocarditis require the presence of inflammatory cells simultaneously with evidence of myocyte necrosis on the same microscopic section when examining a myocardial biopsy. Borderline myocarditis is characterised by inflammatory cell infiltrate without myocardial necrosis. A negative biopsy does not necessarily rule out myocarditis.

Coding Note: Code also the causing condition

Coded Elsewhere: Sarcoid myocarditis (4B20.Y)

Loeffler endocarditis (BC43.20)

BC42.0 **Giant cell myocarditis**

Giant cell myocarditis is a form of dilated cardiomyopathy secondary to myocardial Inflammation that is characterised by widespread infiltration of giant cells (abnormal masses produced by the fusion of macrophages) associated with other inflammatory cells and heart muscle cell destruction.

BC42.1 **Infectious myocarditis**

Infectious myocarditis (infectious inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to discrete infectious external antigens such as a virus, bacteria or parasite.

Coding Note: Code also the causing condition

Exclusions: Acute rheumatic myocarditis (1B41.2)

Myoendocarditis (BB41)

Acute or subacute infectious endocarditis (BB40)

BC42.2 **Hypersensitivity myocarditis**

Hypersensitivity myocarditis is the presence of dilated cardiomyopathy in association with a known related disorder (hypereosinophilic syndrome (usually a restrictive cardiomyopathy), Churg-Strauss syndrome, malignancy, parasite infection, drugs, or vaccines) and findings of interstitial lymphocytic and eosinophilic infiltration, giant cell, and possible myocardial necrosis on biopsy, usually with peripheral eosinophilia.

Inclusions: eosinophilic myocarditis

BC42.3 **Rheumatic myocarditis**

Rheumatic myocarditis is cardiac inflammation and scarring triggered by an autoimmune reaction to group A streptococci infection resulting acutely in pancarditis involving inflammation of the myocardium, endocardium, and epicardium and chronically by valve fibrosis.

Coding Note: Code also the causing condition

BC42.Y **Other specific myocarditis**

Coding Note: Code also the causing condition

BC42.Z **Myocarditis, unspecified**

Coding Note: Code also the causing condition

BC43 Cardiomyopathy

These are myocardial disorders in which the heart muscle is structurally and functionally abnormal, in the absence of coronary artery disease, hypertension, valvular disease and congenital heart disease sufficient to cause the observed myocardial abnormality.

Coding Note: Code also the causing condition

Exclusions: Inflammatory cardiomyopathy (BC42)

Myocarditis (BC42)

Coded Elsewhere: Ischaemic cardiomyopathy (BA51)

Pacing-induced cardiomyopathy (NE82.03)

Cardiomyopathy in the puerperium (JB44.3)

BC43.0 Dilated cardiomyopathy

Dilated cardiomyopathy is a myocardial disorder in which there is systolic dysfunction and chamber dilation of one or both ventricles in the absence of a haemodynamic cause that can produce the existent dilation and dysfunction, including physiological (such as sepsis) or anatomic causes with either abnormal loading conditions (such as coarctation of the aorta) or ischaemia (such as coronary artery disease or anomalies).

Additional information: Physiological and anatomic conditions can affect the dilated cardiomyopathy morphofunctional phenotype. If this morphofunctional phenotype is retained after appropriate intervention, then a dilated cardiomyopathy is established.

Inclusions: Congestive cardiomyopathy

BC43.00 Familial-genetic dilated cardiomyopathy

Familial-genetic dilated cardiomyopathy is the presence of dilated cardiomyopathy that is present in multiple members of a pedigree, or in the presence of a genetic mutation known to be significantly associated with dilated cardiomyopathy.

Additional information: Candidate cytoskeletal and Z disk–encoding genes, most of whom are hypothesized to lead to abnormalities in force transmission, include δ-sarcoglycan, β-sarcoglycan, desmin, lamin A/C, metavinculin, muscle LIM protein, titin, α-actinin-2, nebulette, myopalladin, and ZASP (Z band alternatively spliced PDZ domain protein)

Coded Elsewhere: Dilated cardiomyopathy due to glycogen branching enzyme deficiency (5C51.3)

BC43.01 Nonfamilial dilated cardiomyopathy

Nonfamilial dilated cardiomyopathy is dilated cardiomyopathy secondary to an acquired systemic disorder that is known to be associated with dilated or inflammatory cardiomyopathy such as infectious myocarditis, exposure to toxins such as alcohol or anthracycline therapy, nutritional disorders, autoimmune disease, and many others.

Exclusions: Pacing-induced cardiomyopathy (NE82.03)

BC43.0Z Dilated cardiomyopathy, unspecified

BC43.1 **Hypertrophic cardiomyopathy**

Hypertrophic cardiomyopathy is the presence of a hypertrophied, non-dilated ventricle in the absence of a hemodynamic cause that is capable of producing the existent magnitude of wall thickening excluding both physiologic hypertrophy secondary to physical activity, and pathologic hypertrophy due to systemic hypertension, aortic valvar stenosis, and coarctation.

Coded Elsewhere: Syndrome of infant of a diabetic mother, type 1 or 2, nongestational, insulin dependent (KB60.1)

BC43.10 Familial-genetic hypertrophic cardiomyopathy

Familial isolated hypertrophic cardiomyopathy is the presence of non-syndromic hypertrophic cardiomyopathy in multiple members of a pedigree, or in the presence of a genetic mutation known to be significantly associated with hypertrophic cardiomyopathy.

BC43.11 Non-obstructive hypertrophic cardiomyopathy

Non-obstructive hypertrophic cardiomyopathy is hypertrophic cardiomyopathy that has no fixed or dynamic intraventricular narrowing sufficient to result in a significant pressure gradient between the ventricular apex and the outflow valve (aortic or pulmonary).

BC43.12 Obstructive hypertrophic cardiomyopathy

Obstructive hypertrophic cardiomyopathy is hypertrophic cardiomyopathy that manifests sufficient fixed or dynamic narrowing within one or both ventricles to result in a significant pressure gradient between the ventricular apex and the outflow valve (aortic or pulmonary).

BC43.1Y Other specified hypertrophic cardiomyopathy

BC43.1Z Hypertrophic cardiomyopathy, unspecified

BC43.2 **Restrictive cardiomyopathy**

Restrictive cardiomyopathy is the presence of impaired ventricular diastolic function related to reduced rate and/or extent of relaxation and/or compliance in the absence of another predominant phenotype of dilated or hypertrophic cardiomyopathy.

BC43.20 Nonfamilial restrictive cardiomyopathy

Nonfamilial restrictive cardiomyopathy is restrictive cardiomyopathy secondary to an acquired systemic disorder that is known to be associated with restrictive cardiomyopathy such as amyloidosis, scleroderma, sarcoidosis, or anthracycline therapy.

BC43.2Y Other specified restrictive cardiomyopathy

BC43.2Z Restrictive cardiomyopathy, unspecified

BC43.3 Endocardial fibroelastosis

Endocardial fibroelastosis is the formation of a marked fibro-elastic thickening of the subendocardium in one or both cardiac ventricles. A disorder of fetuses and infants, secondary causes include congenital left-sided obstructive cardiac lesions, metabolic disorders, autoimmune disease (anti-Ro/ anti-La antibodies), and transplacental viral infection such as mumps. Primary endocardial fibroelastosis has been linked to recessive and x-linked inheritance, such as with Barth syndrome.

BC43.4 Cardiomyopathy due to drugs or other external agents

This is one type of cardiomyopathy due to drugs and other external agents. Causing agents are alcohol, cocaine chemotherapeutic agents, psychotherapeutic agents and chemical toxins.

BC43.5 Stress-induced cardiomyopathy

Stress-induced or Takotsubo cardiomyopathy is a disease of the myocardium characterised by episodes of acute onset, reversible left ventricular apical wall motion abnormalities mimicking acute myocardial infarction, but with non-specific electrocardiographic ST elevation and T wave changes, and minimal myocardial enzymatic release, in the absence of coronary stenosis.

Inclusions: Takotsubo cardiomyopathy

BC43.6 **Arrhythmogenic ventricular cardiomyopathy**

Arrhythmogenic ventricular cardiomyopathy is a cardiomyopathy characterised by myocardial cell loss with partial or total replacement of right ventricular muscle by adipose and fibrous tissue, beginning subepicardially to become transmural in time, sparing the papillary muscles and trabeculae, and often associated with aneurysms particularly of the right ventricular outflow tract. There is progressive systolic impairment with ventricular dilation and marked propensity for ventricular arrhythmias of right, as well as left, ventricular origin. Classically a disease of the right ventricle, more recent evidence suggests left ventricular involvement to a varying extent in up to 75% of cases, as well as isolated left ventricular disease.

Source: ISNPCHD and American Heart Association Scientific Statement 2019

Additional information: Arrhythmogenic ventricular cardiomyopathy/dysplasia (AVC/D) is a heart muscle disease clinically characterised by life-threatening ventricular arrhythmias. Its prevalence has been estimated to vary from 1:2,500 to 1:5,000 and is a major cause of sudden death in the young and in athletes. Classically a disease of the right ventricle, more recent evidence suggests left ventricular involvement to a varying extent in up to 75% of cases, as well as isolated left ventricular disease. The clinical picture may include: a subclinical phase without symptoms and with ventricular fibrillation being the first presentation; an electrical disorder with palpitations and syncope, due to tachyarrhythmias of right ventricular origin (left bundle branch block pattern) but also of left ventricular origin (right bundle branch block pattern) when left ventricular disease present; right ventricular or biventricular pump failure, so severe as to require transplantation. The pathology consists of a genetically determined dystrophy of the right (or left) ventricular myocardium with fibro-fatty replacement which may lead to right ventricular aneurysms. The causative genes (ACTN2, DSC2, DSG2, DSP, JUP, TMEM43, LDB3, PKP2, RYR2, TGFB3) encode proteins of mechanical cell junctions (plakoglobin, plakophilin, desmoglein, desmocollin, desmoplakin) and account for intercalated disk remodelling. Familial occurrence with an autosomal dominant pattern of inheritance and variable penetrance has been reported. Recessive variants associated with palmoplantar keratoderma and woolly hair (see these terms) have also been described. Classically clinical diagnosis depends on demonstrating functional and structural alterations of the right ventricle (echocardiography and magnetic resonance imaging), ECG depolarization and repolarization abnormalities, arrhythmias with the left bundle branch block morphology and fibro-fatty replacement through endomyocardial biopsy. Electroanatomic mapping is able to detect areas of low voltage corresponding to myocardial atrophy with fibro-fatty replacement. The main differential diagnoses are idiopathic right ventricular outflow tract tachycardia, myocarditis, dilated cardiomyopathy and sarcoidosis (see these terms). Management includes antiarrhythmic drugs, catheter ablation and implantable cardioverter-defibrillators (ICDs). Young age, family history of juvenile sudden death, QRS dispersion greater than or equal to 340 ms, T-wave inversion, left ventricular involvement, ventricular tachycardia, syncope and prior cardiac arrest are the major risk factors for an adverse prognosis.

BC43.7 **Diabetic cardiomyopathy**

Diabetic cardiomyopathy is the presence of myocardial dysfunction in the absence of overt clinical coronary artery disease, valvar disease, and other conventional cardiovascular risk factors, such as hypertension and dyslipidemia. It is initially characterised by myocardial fibrosis, dysfunctional remodeling, and diastolic dysfunction, progressing to systolic dysfunction and heart failure.

Additional information. The development and progression of diabetic cardiomyopathy has been linked to impaired cardiac insulin metabolic signaling, increases in oxidative stress, reduced nitric oxide bioavailability, collagen-based cardiomyocyte and extracellular matrix stiffness, impaired mitochondrial and cardiomyocyte calcium handling, inflammation, renin–angiotensin–aldosterone system activation, cardiac autonomic neuropathy, endoplasmic reticulum stress, microvascular dysfunction, and a myriad of cardiac metabolic abnormalities.

Coding Note: Always assign an additional code for diabetes mellitus.

BC43.Y **Other specified cardiomyopathy**

Coding Note: Code also the causing condition

BC43.Z **Cardiomyopathy, unspecified**

Coding Note: Code also the causing condition

BC44 **Noncompaction cardiomyopathy**

Noncompaction cardiomyopathy is a morphologic abnormality of the myocardium predominantly affecting the apex of the ventricle characterised by hypertrabeculation and deep inter-trabecular recesses, usually accompanied by an abnormally thin subepicardial layer of compacted myocardium , that is generally but not always associated with ventricular dysfunction.

Additional information. Noncompaction cardiomyopathy classically involves the left ventricle but can also involve only the right ventricle or both. It can occur as an isolated finding or in association with a dilated, hypertrophic, or mixed cardiomyopathic phenotype. It has been described in association with complex congenital heart disease, coronary artery anomalies and as an isolated finding, with and without musculoskeletal and other system abnormalities.

BC45 **Cardiomegaly**

BC46 **Intracardiac thrombosis**

Exclusions: Acute myocardial infarction, without specification of ST elevation (BA41)

BC4Y **Other specified diseases of the myocardium or cardiac chambers**

BC4Z **Diseases of the myocardium or cardiac chambers, unspecified**

Cardiac arrhythmia (BC60-BC9Z)

This is any of a large and heterogeneous group of conditions in which there is abnormal electrical activity in the heart. The heartbeat may be too fast or too slow, and may be regular or irregular.

Coded Elsewhere: Cardiac arrest (MC82)

Cardiac arrhythmias in the neonate (KB41)

Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)

BC60 **Atrial premature depolarization**

Cardiac electrical depolarization arising from the atria, occurring earlier than the expected sinus beat

BC61 **Junctional premature depolarization**

Cardiac electrical depolarization arising from the compact atrioventricular node or His bundle occurring earlier than the expected sinus beat.

BC62 **Accessory pathway**

An additional electrical connection which typically bypasses the AV node, typically inserting directly into atrial and ventricular myocardium, but may also connect to the specialised conduction system (e.g., the bundle of His, right or left bundles, or one of the fascicles).

BC63 **Conduction disorders**

Any abnormal alteration of atrio-ventricular conduction.

Coded Elsewhere: Congenital heart block (LA8Y)

BC63.0 **Atrioventricular block, first degree**

Disorder of the atrioventricular conduction system in which the PR interval is greater than the 97th percentile for age or > 200 ms in adults

BC63.1 **Atrioventricular block, second degree**

Disorder of the atrioventricular conduction system in which some but not all atrial impulses fail to propogate to the ventricles. Electrocardiographically, some P waves are not followed by a QRS complex

BC63.10 High-grade second degree atrioventricular block

Form of second degree atrioventricular block in which either multiple consecutive P-waves are not conducted or there are transient periods of atrioventricular dissociation

BC63.1Y Other specified atrioventricular block, second degree

BC63.1Z Atrioventricular block, second degree, unspecified

BC63.2 **Complete atrioventricular block**

Disorder of the atrioventricular conduction system in which there is failure of all atrial impulses to propagate to the ventricle

Inclusions: Third-degree block

BC63.20 Congenital complete atrioventricular block

Third degree atrioventricular block is defined as the absence of atrioventricular node conduction and here it is congenital, that is it has been present since birth and is not acquired, although but may be first detected later.

Exclusions: Congenital complete heart block (LA80-LA8Z)

BC63.21 Acquired complete atrioventricular block

Complete atrioventricular block in which the onset of the conduction disorder is recognised after birth

BC63.2Z Complete atrioventricular block, unspecified

BC63.3 **Right bundle branch block**

Disorder of the atrioventricular conduction system characterised by prolonged QRS duration (greater than or equal to 120 ms in adults, greater than 100 ms in children ages 4 to 16 years, and greater than 90 ms in children less than 4 years of age), rsr, rsR, or rSR in leads V1 or V2, S wave of greater duration than R wave (or greater than 40 ms in leads I and V6 in adults)

BC63.4 **Left bundle branch block**

Disorder of the atrioventricular conduction system in which the QRS duration is greater than or equal to 120 ms in adults, greater than 100 ms in children 4 to 16 years of age, and greater than 90 ms in children less than 4 years of age; there is a QS or rS pattern in lead V1 and a wide slurred R wave in leads I and V6.

BC63.40 Left anterior fascicular block

Disorder of the atrioventricular conduction system characterised by left axis deviation for age (frontal plane axis between -45° and -90°), qR pattern in lead aVL, R-peak time in lead aVL of 45 ms or more, and a QRS duration that does not meet age dependent criteria for complete bundle branch block (less than 120 ms in adults, less than 100 ms in children 4 to 16 years of age, and less than 90 ms in children less than 4 years of age)

BC63.41 Left posterior fascicular block

Disorder of the atrioventricular conduction system characterised by right axis deviation for age (between 90° and 180° in adults), with a qR pattern in inferior leads, rS pattern in leftward leads (I and aVL), and a QRS duration that does not meet age dependent criteria for complete bundle branch block (less than 120 ms in adults, less than 100 ms in children 4 to 16 years of age, and less than 90 ms in children less than 4 years of age)

BC63.4Z Left bundle branch block, fascicle unspecified

BC63.5 **Nonspecific intraventricular conduction delay**

Disorder of the atrioventricular conduction system characterised by a prolonged QRS duration (QRS duration greater than 110 ms in adults, greater than 90 ms in children 8 to 16 years of age, and greater than 80 ms in children less than 8 years of age) without criteria for right or left bundle branch block.

BC63.Y **Other specified conduction disorders**

BC63.Z **Conduction disorders, unspecified**

BC64 Sudden arrhythmic death syndrome

BC65 Cardiac arrhythmia associated with genetic disorder

BC65.0 **Long QT syndrome**

A congenital disorder of ventricular myocardial repolarization characterised by a prolonged QT interval on the electrocardiogram (ECG) that can lead to symptomatic ventricular arrhythmias and an increased risk of sudden cardiac death.

BC65.1 **Brugada syndrome**

Clinical manifestations of cardiac syncope, ventricular tachycardia, ventricular fibrillation, or sudden death in conjunction with a genetic mutation associated with Brugada Syndrome and/or a Brugada pattern ECG (spontaneous or provoked).

BC65.2 **Short QT syndrome**

Familial short QT syndrome is a rare cardiac rhythm disorder that associates a short QT interval (QT and QTc 300 ms) on the surface electrocardiogram (ECG) with a high risk of syncope or sudden death due to malignant ventricular arrhythmia.

BC65.3 **Early repolarisation syndrome**

Genetic arrhythmia disorder characterised by inferolateral J wave elevation noted on ECG in conjunction with ventricular fibrillation not explained by other causes.

BC65.4 **Idiopathic ventricular fibrillation**

Genetic arrhythmia disorder characterised by occurrence of ventricular fibrillation in the absence of other underlying causes, including absence of electrocardiogram (ECG) findings of Brugada syndrome, bidirectional ventricular tachycardia, and inferolateral J wave elevation.

BC65.5 **Catecholaminergic polymorphic ventricular tachycardia**

Catecholaminergic polymorphic ventricular tachycardia (CPVT) is a severe genetic arrhythmogenic disorder of childhood characterised by adrenergically-induced ventricular tachycardia (bidirectional ventricular tachycardia and, less frequently, supraventricular tachycardia and atrial fibrillation) manifesting as syncope and sudden death.

BC65.Y **Other specified cardiac arrhythmia associated with genetic disorder**

BC65.Z **Cardiac arrhythmia associated with genetic disorder, unspecified**

Ventricular rhythm disturbance (BC70-BC7Z)

Any cardiac rhythm anomaly arising from the ventricles.

BC70 Ventricular premature depolarization

Ventricular depolarization occurring earlier than the expected ventricular depolarization initiated by the sinoatrial node or another supraventricular pacemaker.

BC71 **Ventricular tachyarrhythmia**

Any ventricular rhythm disturbance with a rate faster than the normal age dependent ventricular escape rate.

BC71.0 **Ventricular tachycardia**

Ventricular tachycardia is a cardiac arrhythmia of three or more consecutive complexes in duration emanating from the ventricles at a rate of greater than 120 bpm in adolescents or adults and a rate greater than 150 bpm in child. Ventricular tachycardia may occur with or without loss of cardiac output.

BC71.00 Right outflow tract ventricular tachycardia

Monomorphic ventricular tachycardia with focal activity originating from the right ventricular outflow tract, having a left bundle branch block (LBBB) morphology and inferior axis.

BC71.01 Polymorphic ventricular tachycardia

Ventricular tachycardia with 2 or more QRS morphologies.

BC71.02 Sustained ventricular tachycardia

Ventricular tachycardia that has a duration of >30 seconds or causes haemodynamic instability.

BC71.03 Non-sustained ventricular tachycardia

Ventricular tachycardia lasting less than or equal to 30 seconds

BC71.0Y Other specified ventricular tachycardia

BC71.0Z Ventricular tachycardia, unspecified

BC71.1 **Ventricular fibrillation**

Ventricular fibrillation is a rapid grossly irregular ventricular rhythm, usually more than 300 bpm/200 ms (cycle length 180 ms or less), with marked variability in QRS cycle length, morphology, and amplitude, associated with loss of cardiac output, and is usually sustained, requiring intervention to terminate.

BC71.2 **Re-entry ventricular arrhythmia**

BC71.Y **Other specified ventricular tachyarrhythmia**

BC71.Z **Ventricular tachyarrhythmia, unspecified**

BC7Y **Other specified ventricular rhythm disturbance**

BC7Z **Ventricular rhythm disturbance, unspecified**

Supraventricular rhythm disturbance (BC80-BC8Z)

BC80 **Supraventricular bradyarrhythmia**

Any of a number of possible arrhythmias originating from at or above the level of bundle of His in which the heart beats slower than the age-dependent lower limits of normal.

BC80.0 **Sinus pause**

An interruption in the typical sinus cadence where the p-p interval > sum of 2 previous p-p (excludes sinus arrhythmia).

BC80.1 **Sinus bradycardia**

Resting sinus rates below the 97% for age (<60 bpm in adults).

BC80.2 **Sinus node dysfunction**

Non-specific term that refers to abnormalities in sinus node impulse formation and propagation and includes sinus bradycardia, sinus pause/arrest, chronotropic incompetence, and sinoatrial exit block.

BC80.20 Sick sinus syndrome

Sick sinus syndrome may be defined as inappropriate sinus rates (either resting bradycardia or chronotropic incompetence) which may be associated with episodes of atrial tachycardia.

BC80.21 Sinoatrial block

Delay or block of the electrical impulse from the sinus node to the atria

BC80.2Y Other specified sinus node dysfunction

BC80.2Z Sinus node dysfunction, unspecified

BC80.Y **Other specified supraventricular bradyarrhythmia**

BC80.Z **Supraventricular bradyarrhythmia, unspecified**

BC81 **Supraventricular tachyarrhythmia**

Tachycardia originating at or above the atrioventricular (AV) node, usually with a narrow QRS or QRS complex similar to the sinus QRS morphology.

BC81.0 **Ectopic atrial tachycardia**

Ectopic atrial tachycardia originates from a small area (focus) in the atrium and spreading centrifugally.

BC81.1 **Junctional ectopic tachycardia**

Narrow or usual complex tachycardia originates from a focus at or near the atrioventricular junction.

BC81.2 **Macro reentrant atrial tachycardia**

An atrial arrhythmia in which there is intra-atrial reentry or circus movement around a fixed or functional central obstacle. The central obstacle may consist normal (e.g. valves) or abnormal (e.g., scar) structures.

This form of SVT originates in the atrium; conduction to the ventricles is not necessary for the tachycardia to continue. An organised atrial rhythm with a rate typically between 250 and 350 bpm, including tachycardias using a variety of reentry circuits that often occupy large areas of the atrium (‘‘macro-reentrant’’). Here the arrhythmia involves the cavotricuspid isthmus.

BC81.20 Cavotricuspid isthmus dependent macroreentry tachycardia

A macro re-entrant atrial tachycardia that rotates around the tricuspid annulus.

BC81.21 Non-scar, non-isthmus dependent macro reentrant atrial tachycardia

A macro re-entrant atrial tachycardia coursing around a normal cardiac structure (except the cavotricuspid isthmus) such as the mitral valve annulus, or superior caval vein.

BC81.22 Scar mediated macro reentrant atrial tachycardia

A macro re-entrant atrial tachycardia in which the central obstacle and/or the zone of slow conduction sustaining the tachycardia are due to scar. In this context scar generally refers to surgical or ischaemic heart disease mediated scarring rather than the fibrosis than can accompany other disease states or aging.

BC81.2Y Other specified macro reentrant atrial tachycardia

BC81.2Z Macro reentrant atrial tachycardia, unspecified

BC81.3 **Atrial fibrillation**

An atrial tachyarrhythmia characterised by rapid (usually faster than 300 bpm), irregular and uncoordinated atrial impulse generation, usually manifesting on ECG with indistinct P-waves and an irregularly irregular ventricular response.

BC81.30 Paroxysmal atrial fibrillation

Recurrent AF (>=2 episodes) that terminates spontaneously within 7 days or less (usually within 24 hours).

BC81.31 Persistent atrial fibrillation

Atrial fibrillation (AF) which is sustained beyond seven days, or lasting less than seven days but necessitating pharmacologic or electrical cardioversion to restore normal sinus rhythm.

BC81.32 Permanent atrial fibrillation

A term used to identify individuals with persistent AF where a decision has been made to no longer pursue a rhythm control strategy, or where cardioversion has either failed or not been attempted.

BC81.33 Preexcited atrial fibrillation

Atrial fibrillation that occurs in the setting of a preexcitation syndrome such a Wolff-Parkinson-White syndrome, resulting in an erratic wide-complex rhythm that can degenerate into ventricular fibrillation, and sudden cardiac death.

BC81.3Y Other specified atrial fibrillation

BC81.3Z Atrial fibrillation, unspecified

BC81.4 **Wolff-Parkinson-White syndrome**

Arrhythmia symptoms, documented supraventricular tachycardia, and/or cardiac arrest due to rapidly conducted atrial fibrillation associated with preexcitation on electrocardiogram. Includes latent preexcitation identified during electrophysiology study.

BC81.5 **Sinus node reentrant tachycardia**

A reentrant tachycardia within the sinus node/perinodal tissue characterised by abrupt onset/termination, regular cadence, and P-waves consistent with sinus node origin

BC81.6 **Inappropriate sinus tachycardia**

Heart rate which is elevated with regard to level of activity; usually exhibits features of automaticity.

BC81.7 **Atrioventricular reciprocating tachycardia**

A macro-reentrant tachycardia involving the atria and ventricles in series that uses the atrioventricular node or an accessory pathway for one limb of the circuit and an accessory pathway for the other.

BC81.70 Atrioventricular reciprocating tachycardia, orthodromic

An atrioventricular reciprocating tachycardia that uses an accessory pathway for retrograde conduction and the atrioventricular node for anterograde conduction resulting in a narrow or usual complex tachycardia.

BC81.71 Atrioventricular reciprocating tachycardia, antidromic

An atrioventricular reciprocating tachycardia that uses the atrioventricular node for retrograde conduction and the accessory pathway for anterograde conduction resulting in a wide complex tachycardia.

BC81.7Y Other specified atrioventricular reciprocating tachycardia

BC81.7Z Atrioventricular reciprocating tachycardia, unspecified

BC81.8 **Atrioventricular nodal reentry tachycardia**

A reentrant supraventricular tachycardia that uses multiple slow atrioventricular nodal pathways or a slow atrioventricular nodal pathway in conjunction with a fast atrioventricular nodal pathway in a reentry circuit.

BC81.Y **Other specified supraventricular tachyarrhythmia**

BC81.Z **Supraventricular tachyarrhythmia, unspecified**

BC8Y **Other specified supraventricular rhythm disturbance**

BC8Z **Supraventricular rhythm disturbance, unspecified**

BC90 **Rhythm disturbance at level of atrioventricular junction**

BC91 **Pacemaker or implantable cardioverter defibrillator battery at end of battery life**

Pacemaker or implantable cardioverter defibrillator (ICD) battery at or near complete exhaustion.

Coding Note: Note: "End of life" refers to the end of the battery's life not the patient's life.

BC9Y **Other specified cardiac arrhythmia**

BC9Z **Cardiac arrhythmia, unspecified**

Heart failure (BD10-BD1Z)

Exclusions: Heart failure following cardiac surgery or due to presence of cardiac prosthesis (BE11)

complicating abortion or ectopic or molar pregnancy (JA05)

complicating obstetric surgery and procedures (JB0D.3)

Coded Elsewhere: Neonatal cardiac failure (KB40)

BD10 **Congestive heart failure**

A clinical syndrome characterised by abnormalities of ventricular function and neurohormonal regulation which are accompanied by effort intolerance and fluid retention.

Coding Note: Code also the causing condition

Inclusions: Congestive heart disease

BD11 **Left ventricular failure**

A clinical syndrome characterised by abnormalities of left ventricular function resulting in pulmonary congestion and fluid retention.

Coding Note: Code also the causing condition

Inclusions: Left heart failure

BD11.0 Left ventricular failure with preserved ejection fraction

A syndrome of left ventricular dysfunction occurring with normal or relatively preserved ejection fraction

Coding Note: Code also the causing condition

BD11.1 Left ventricular failure with mid range ejection fraction

Coding Note: Code also the causing condition

BD11.2 Left ventricular failure with reduced ejection fraction

A syndrome of left ventricular dysfunction associated with reduced ejection fraction.

Coding Note: Code also the causing condition

BD11.Z Left ventricular failure, unspecified

Coding Note: Code also the causing condition

BD12 **High output syndromes**

Increased cardiac output above normal associated with anaemia, arteriovenous fistulas, thyrotoxicosis and other syndromes. May result in heart failure.

BD13 **Right ventricular failure**

Heart failure associated with right ventricular dysfunction manifest by distention of the neck veins, enlargement of the liver, and dependent oedema.

Coding Note: Code also the causing condition

BD14 **Biventricular failure**

Coding Note: Code also the causing condition

BD1Y **Other specified heart failure**

Coding Note: Code also the causing condition

BD1Z **Heart failure, unspecified**

Coding Note: Code also the causing condition

Diseases of arteries or arterioles (BD30-BD5Z)

Exclusions: Diseases of coronary artery (BA81-BA8Z)

BD30 **Acute arterial occlusion**

Coding Note: Code also the causing condition

BD30.0 **Acute upper limb arterial occlusion**

BD30.00 Acute thromboembolic upper limb arterial occlusion

BD30.01 Acute thrombotic upper limb arterial occlusion

BD30.0Y Other specified acute upper limb arterial occlusion

BD30.0Z Acute upper limb arterial occlusion, unspecified

BD30.1 **Acute aortoiliac occlusion**

BD30.10 Acute thromboembolic aortoiliac occlusion

BD30.11 Acute thrombotic aortoiliac occlusion

BD30.1Y Other specified acute aortoiliac occlusion

BD30.1Z Acute aortoiliac occlusion, unspecified

BD30.2 **Acute lower limb arterial occlusion**

BD30.20 Acute thromboembolic lower limb arterial occlusion

BD30.21 Acute thrombotic lower limb arterial occlusion

BD30.2Y Other specified acute lower limb arterial occlusion

BD30.2Z Acute lower limb arterial occlusion, unspecified

BD30.Y **Other specified acute arterial occlusion**

Coding Note: Code also the causing condition

BD30.Z **Acute arterial occlusion, unspecified**

Coding Note: Code also the causing condition

Coded Elsewhere: Secondary peripheral angiopathy (BD53.Y)

BD40 Atherosclerotic chronic arterial occlusive disease

Inclusions: endarteritis deformans

senile arteritis

senile endarteritis

Exclusions: Chronic vascular disorders of intestine (DD31)

Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1)

Coronary atherosclerosis (BA52)

Chilblains (NF03.0)

Frostbite (NE40-NE4Z)

Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)

Asymptomatic stenosis of intracranial or extracranial artery (BD55)

Coded Elsewhere: Atherosclerotic retinopathy (BD40.Y)

BD40.0 Lower limb atherosclerosis

This is a condition in which an artery wall thickens as a result of the accumulation of fatty materials such as cholesterol, of the lower limb.

BD40.1 Atherosclerosis of aorta

BD40.2 Atherosclerosis of renal artery

Exclusions: atherosclerosis of renal arterioles (BA02)

BD40.3 Aortic bifurcation syndrome

BD40.Y Other specified atherosclerotic chronic arterial occlusive disease

BD40.Z Atherosclerotic chronic arterial occlusive disease, unspecified

BD41 Non-atherosclerotic chronic arterial occlusive disease

A heterogeneous group of disorders which may present with symptoms suggestive of atherosclerotic peripheral arterial disease (e.g. intermittent claudication) but in which arterial or arteriolar occlusion is due to other causes such as fibromuscular dysplasia, thromboarteritis obliterans and calcific arteriolopathy.

Coded Elsewhere: Thromboangiitis obliterans (4A44.8)

Calcific arteriolopathy (EB90.42)

BD41.0 Arterial fibromuscular dysplasia

Fibromuscular dysplasia, formerly called fibromuscular fibroplasia, is a group of nonatherosclerotic, noninflammatory arterial diseases that most commonly involve the renal and carotid arteries.

BD41.Y Other specified non-atherosclerotic chronic arterial occlusive disease

BD41.Z **Non-atherosclerotic chronic arterial occlusive disease, unspecified**

BD42 Raynaud phenomenon

Raynaud phenomenon describes an exaggerated vascular response to cold temperature or emotional stimuli resulting in episodic digital ischaemia. It is characterised by paroxysmal vasoconstriction producing initially pallor, an essential component for the diagnosis, followed by cyanosis and erythema. Primary Raynaud disease is an isolated innocuous disorder. Secondary Raynaud phenomenon occurs in association with a wide range of different disorders including dysproteinaemias and non-organ-specific systemic autoimmune diseases.

BD42.0 **Primary Raynaud disease**

Raynaud phenomenon unassociated with any concomitant disease, drug or other provoking trauma. Criteria for diagnosis include: bilateral symmetrical episodic attacks without evidence of peripheral vascular disease or tissue injury, normal nail fold capillaroscopy, negative antinuclear antibody and normal erythrocyte sedimentation rate.

Inclusions: Raynaud disease

BD42.1 **Secondary Raynaud phenomenon**

Coding Note: Code also the causing condition

BD42.Z **Raynaud phenomenon, unspecified**

BD4Y Other specified chronic arterial occlusive disease

BD4Z Chronic arterial occlusive disease, unspecified

BD50 Aortic aneurysm or dissection

Aortic aneurysm is a term for any swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location. Aortic dissection occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart.

Coded Elsewhere: Postprocedural true or false aortic aneurysm (BE13)

Aortic aneurysm due to congenital heart disease (LA8Y)

BD50.0 **Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch**

This occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart: ascending aorta dissection and propagation beyond arch.

BD50.00 Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch with perforation

BD50.01 Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch with rupture

BD50.02 Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch without mention of perforation or rupture

BD50.0Y Other specified thoracic aortic dissection, ascending aorta dissection and propagation beyond arch

BD50.0Z Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch, unspecified

BD50.1 Ascending aorta dissection not beyond arch

BD50.10 Ascending aorta dissection not beyond arch with perforation

BD50.11 Ascending aorta dissection not beyond arch with rupture

BD50.12 Ascending aorta dissection not beyond arch without mention of perforation or rupture

BD50.1Y Other specified ascending aorta dissection not beyond arch

BD50.1Z Ascending aorta dissection not beyond arch, unspecified

BD50.2 Descending aorta dissection and distal propagation

This occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart, and distal propagation.

BD50.20 Descending aorta dissection and distal propagation with perforation

BD50.21 Descending aorta dissection and distal propagation with rupture

BD50.22 Descending aorta dissection and distal propagation without mention of perforation or rupture

BD50.2Y Other specified descending aorta dissection and distal propagation

BD50.2Z Descending aorta dissection and distal propagation, unspecified

BD50.3 Thoracic aortic aneurysm

BD50.30 Thoracic aortic aneurysm with perforation

BD50.31 Thoracic aortic aneurysm with rupture

BD50.32 Thoracic aortic aneurysm without mention of perforation or rupture

BD50.3Y Other specified thoracic aortic aneurysm

BD50.3Z Thoracic aortic aneurysm, unspecified

BD50.4 Abdominal aortic aneurysm

BD50.40 Abdominal aortic aneurysm with perforation

BD50.41 Abdominal aortic aneurysm with rupture

BD50.4Y Other specified abdominal aortic aneurysm

BD50.4Z Abdominal aortic aneurysm, unspecified

BD50.5 Thoracoabdominal aortic aneurysm

BD50.50 Thoracoabdominal aortic aneurysm with perforation

BD50.51 Thoracoabdominal aortic aneurysm with rupture

BD50.52 Thoracoabdominal aortic aneurysm without mention of perforation or rupture

BD50.5Y Other specified thoracoabdominal aortic aneurysm

BD50.5Z Thoracoabdominal aortic aneurysm, unspecified

BD50.Z **Aortic aneurysm or dissection, unspecified**

BD51 Arterial aneurysm or dissection, excluding aorta

Exclusions:
- Aneurysm of pulmonary artery (BB02.1)
- aneurysm of heart (BA41)
- aneurysm of varicose (BD52.1)
- aneurysm of retinal (9B78.1)
- dissection of precerebral artery, congenital (nonruptured) (LA90.41)
- aneurysm (of): aorta (BD50)
- aneurysm (of): arteriovenous NOS acquired (BD52.1)
- Cerebral aneurysm, nonruptured (8B22.5)
- Coronary artery aneurysm (BA81)
- ruptured cerebral aneurysm (8B01.0)

BD51.0 **Aneurysm or dissection of carotid artery**

BD51.1 **Aneurysm or dissection of vertebral artery**

BD51.2 **Aneurysm or dissection of other precerebral arteries**

Exclusions:
- Aneurysm or dissection of carotid artery (BD51.0)
- Aneurysm or dissection of vertebral artery (BD51.1)

BD51.3 **Aneurysm or dissection of artery of upper extremity**

BD51.4 **Aneurysm or dissection of renal artery**

BD51.5 **Aneurysm or dissection of iliac artery**

BD51.6 **Aneurysm or dissection of artery of lower extremity**

BD51.Y **Aneurysm and dissection of other artery, excluding aorta**

BD51.Z **Aneurysm and dissection of unspecified artery**

BD52 Certain specified disorders of arteries or arterioles

Exclusions:
- collagen (vascular) diseases (4A40-4A4Z)
- Hypersensitivity angiitis (4A44.B)
- Acute arterial occlusion (BD30)
- Chronic arterial occlusive disease (BD40-BD4Z)

BD52.0 **Segmental arterial mediolysis**

Segmental arterial mediolysis is a rare noninflammatory vascular disease of the abdominal splanchnic arteries, characterised by disruption of the arterial medial layer. It will induce multiple aneurysms in mesenteric arteries with susceptibility to vessel dissection, haemorrhage and mesenteric ischemia.

BD52.1 **Arteriovenous fistula, acquired**

Exclusions: Cerebral aneurysm, nonruptured (8B22.5)

traumatic - see injury of blood vessel by body region. (Chapter 22)

Coronary artery aneurysm (BA81)

BD52.2 **Stricture of artery**

BD52.3 **Rupture of artery**

Exclusions: traumatic rupture of artery - see injury of blood vessel by body region. (Chapter 22)

BD52.4 **Necrosis of artery**

BD52.5 **Coeliac artery compression syndrome**

BD52.6 **Congenital great vessel related acquired abnormality**

Any postnatal pathological change in form or function of the heart and/or great vessels consequent to the presence of congenital cardiovascular disease.

Exclusions: Acquired systemic vein abnormality (BD73)

Acquired pulmonary venous abnormality (BB03)

Acquired pulmonary arterial tree abnormality (BB02.3)

Coded Elsewhere: Acquired abnormality of congenitally malformed valve (BC02)

Postprocedural arterial duct disorder (BE14.A)

Acquired narrowing of constructed cardiac intraventricular tunnel (BE14.B)

Acquired subaortic stenosis (BB70.Y)

Acquired pulmonary atresia (BB90.Y)

Cardiac conduit related disorder (BE14.B)

Superior cavopulmonary anastomosis related disorder (BE14.B)

Systemic-to-pulmonary arterial shunt related disorder (BE14.B)

BD52.7 **Certain acquired abnormalities of aorta**

A pathological change in form or function of the aorta that develops after birth.

Coded Elsewhere: Recoarctation of the aorta (BE14.9)

BD52.70 Acquired abnormality of aortic arch branch

A postnatal pathological change in form or function of one or more branches of the aortic arch.

BD52.71 Acquired ascending aorta or root dilation

Enlargement of the luminal diameter of the aorta between the ventriculo-aortic junction and the origin of the first brachiocephalic branch above the upper limit of normal adjusted for body size that develops after birth

Coded Elsewhere: Postprocedural ascending aorta dilation (BE14.9)

BD52.7Y Other specified certain acquired abnormalities of aorta

BD52.7Z Certain acquired abnormalities of aorta, unspecified

BD53 Secondary disorders of arteries and arterioles

Coding Note: Code also the causing condition

BD53.0 Arterial cystic medial diseases

Coding Note: Code also the causing condition

BD53.1 Hypothenar hammer syndrome

BD53.2 Iliac artery arteriopathy

BD53.3 Popliteal entrapment syndrome

BD53.4 Cholesterol atheroembolism

Embolic occlusion of distal small arteries and arterioles by cholesterol crystals released from atherosclerotic plaque in larger more central arteries. The resultant microvascular ischaemia is accompanied by an inflammatory response to the presence of cholesterol crystals. This may occur spontaneously or as a complication of angiography or vascular surgery. Organs most commonly affected include the skin, kidneys, gastrointestinal tract, and brain. Cutaneous manifestations, present in the majority of cases, include livedo reticularis and focal ischaemic necrosis and ulceration; these are commonly associated with acute kidney injury.

BD53.40 Cholesterol atheroembolism to kidneys

This occurs when cholesterol is released, usually from an atherosclerotic plaque, and travels along with the bloodstream (embolism) to other places in the kidneys, where it obstructs blood vessels.

BD53.4Y Cholesterol atheroembolism to other specified sites

BD53.4Z Cholesterol atheroembolism to unspecified site

BD53.Y Other specified secondary disorders of arteries and arterioles

Coding Note: Code also the causing condition

BD53.Z Secondary disorders of arteries and arterioles, unspecified

Coding Note: Code also the causing condition

BD54 **Diabetic foot ulcer**

Chronic foot ulcers occur in as many as 15–25% of diabetic patients. The underlying aetiology is a combination of disturbed sensation from diabetic neuropathy and impaired perfusion from diabetic vasculopathy. Poor foot care, abnormal foot structure, or poorly fitting shoes increase the risk of diabetic foot ulcers. The ulcers typically occur in areas of increased plantar pressure, especially beneath the metatarsal heads.

Coding Note: Always assign an additional code for diabetes mellitus.

BD55 **Asymptomatic stenosis of intracranial or extracranial artery**

Stenosis of intracranial or extracranial artery that has not caused TIA or cerebral ischemic stroke.

Inclusions: narrowing of basilar, carotid or vertebral arteries, not resulting in cerebral infarction

Exclusions: Transient ischaemic attack (8B10)

Cerebral ischaemic stroke (8B11)

BD56 **Asymptomatic occlusion of intracranial or extracranial artery**

Occlusion of intracranial or extracranial artery that has not caused TIA or cerebral ischemic stroke.

Exclusions: Transient ischaemic attack (8B10)

Cerebral ischaemic stroke (8B11)

BD5Y **Other specified diseases of arteries or arterioles**

BD5Z **Diseases of arteries or arterioles, unspecified**

Diseases of veins (BD70-BD7Z)

Coded Elsewhere: Other venous complications following abortion, ectopic or molar pregnancy (JA05.7)

Venous complications in pregnancy (JA61)

BD70 **Superficial thrombophlebitis**

Coded Elsewhere: Superficial thrombophlebitis in pregnancy (JA61.2)

Superficial thrombophlebitis in the puerperium (JB41.0)

BD70.0 Superficial thrombophlebitis of lower limbs

Inflammation and thrombosis of the superficial veins of the lower limbs affecting particularly varicose superficial leg veins.

BD70.1 Superficial thrombophlebitis of upper limbs

BD70.2 Thrombophlebitis migrans

Thrombophlebitis migrans is characterised by the development of recurrent and migratory superficial thrombophlebitis. It is an acquired coagulopathy that is strongly associated with malignancy, especially solid tumours of the adenocarcinoma type.

Coding Note: Code also the causing condition

BD70.3 **Mondor disease**

A form of localised superficial venous thrombophlebitis typically affecting the chest wall and manifesting as a fibrous cord with surrounding skin retraction and an absence of overlying cutaneous inflammation. No cause is found in many cases but trauma and breast surgery are often implicated.

Coded Elsewhere: Mondor disease of the penis (GB06.3)

BD70.Y **Other specified superficial thrombophlebitis**

BD70.Z **Superficial thrombophlebitis, unspecified**

BD71 Deep vein thrombosis

The process whereby thrombus (blood clot) forms in the large veins of the peripheral venous system. In addition to obstructing venous return it posses a hazard whereby thrombus may detach and embolize to the pulmonary circulation.

Coded Elsewhere: Deep phlebothrombosis in pregnancy (JA61.3)

Deep phlebothrombosis in the puerperium (JB41.1)

BD71.0 **Upper limb deep vein thrombosis**

Venous thrombosis within the deep veins of the upper limb.

BD71.1 **Vena caval thrombosis**

Venous thrombosis within the vena cava.

BD71.2 **Renal vein thrombosis**

Venous thrombosis within the renal vein

BD71.3 **Iliac vein thrombosis**

Venous thrombosis within the iliac veins.

BD71.4 **Lower limb deep vein thrombosis**

Thrombosis within the deep venous system of the lower limb.

BD71.Y **Other specified deep vein thrombosis**

BD72 Venous thromboembolism

BD73 Acquired systemic vein abnormality

A postnatal pathological change in form or function of a systemic vein.

BD73.0 **Acquired inferior caval vein abnormality**

A postnatal pathologic pathological change in form or function of the inferior caval vein (inferior vena cava).

Coded Elsewhere: Inferior caval vein obstruction due to foreign body (BE1C)

BD73.1 **Acquired superior caval vein abnormality**

A postnatal pathological change in form or function of the superior caval vein (superior vena cava).

Coded Elsewhere: Superior caval vein obstruction due to foreign body (BE1D)

BD73.2 **Systemic vein obstruction**

A postnatal pathologic condition of a systemic vein in which flow is impeded or blocked due to narrowing or atresia.

BD73.20 Obstruction of peripheral vein

A postnatal pathologic condition of a peripheral vein in which flow is impeded or blocked due to narrowing or atresia.

BD73.21 Obstruction of visceral vein

A postnatal pathologic condition of a visceral vein in which flow is impeded or blocked due to narrowing or atresia.

BD73.2Y Other specified systemic vein obstruction

BD73.2Z Systemic vein obstruction, unspecified

BD73.3 **Acquired coronary sinus abnormality**

A postnatal pathologic hange in form or function of the coronary sinus.

BD73.Y **Other specified acquired systemic vein abnormality**

BD73.Z **Acquired systemic vein abnormality, unspecified**

BD74 **Chronic peripheral venous insufficiency of lower extremities**

The presence of increased pressure in the peripheral venous system, particularly of the lower extremities. Peripheral venous hypertension may be due to incompetence of venous valves following deep vein thrombosis but other factors including obesity may also impair venous return. The consequences of chronic peripheral venous insufficiency include varicose veins, venous ulceration and lymphoedema.

Coded Elsewhere: Lymphoedema due to venous insufficiency (BD93.10)

BD74.0 **Uncomplicated lower limb venous hypertension**

The presence of lower limb venous incompetence or hypertension as may be manifest by the presence of haemosiderin pigmentation of the skin, telangiectasia or finely dilated superficial veins.

Coded Elsewhere: Lower limb venous telangiectases (EF20.2)

BD74.1 **Lower limb varicose veins**

The commonest manifestation of chronic peripheral venous insufficiency, varicose veins present as dilatation and tortuosity of the superficial veins of the lower extremities. Incompetence of the superficial venous valve system impedes the return of venous blood to the heart. Chronically increased venous pressure causes symptoms like heaviness, discomfort, extremity fatigue, itching, and dull or burning pain.

Exclusions: complicating: puerperium (JB41)

Coded Elsewhere: Varicose veins of lower extremity in pregnancy (JA61.0)

BD74.10 Varicose veins with great saphenous reflux

Varicose veins associated with reflux within the great saphenous vein, normally as the result of valve incompetence: this can be due to congenitally weak valves or following injury from direct trauma or venous thrombosis.

BD74.11 Varicose veins with small saphenous reflux

Varicose veins associated with reflux within the small saphenous vein, normally as the result of valve incompetence: this can be due to congenitally weak valves or following injury from direct trauma or venous thrombosis.

BD74.12 Varicose veins with non-truncal reflux

Varicose veins associated with reflux sparing the main truncal veins of the lower limb.

BD74.1Z Lower limb varicose veins, not further specified

BD74.2 Lipodermatosclerosis

Lipodermatosclerosis is a form of panniculitis of the lower legs that develops in the context of venous insufficiency, giving rise to features that include oedema, erythema, hyperpigmentation and induration. In the acute phase tenderness, erythema and oedema predominate and may mimic cellulitis. As the condition becomes chronic, post-inflammatory pigmentation, fibrosis and lymphoedema predominate, sometimes resulting in the lower leg assuming an “inverted champagne bottle” appearance.

BD74.3 Venous leg ulcer

Venous leg ulcers are chronic skin ulcers of the gaiter area (ankle and lower leg) due to chronic peripheral venous hypertension. They are often associated with other manifestations of chronic peripheral venous insufficiency of the lower extremities including lower limb varicose veins and lipodermatosclerosis.

Inclusions: Gravitational ulcer

Varicose ulcer

BD74.30 Primary venous leg ulcer

A venous leg ulcer developing in skin without preceding episodes of ulceration.

BD74.31 Recurrent venous leg ulcer

A venous leg ulcer developing in skin which has been damaged by previous episodes of ulceration. The chances of long-term healing are reduced in comparison with primary venous leg ulcers.

BD74.32 Healed venous leg ulcer

BD74.3Z Venous leg ulcer, unspecified

BD74.Z Chronic peripheral venous insufficiency of lower extremities, unspecified

BD75 **Venous varicosities of sites other than lower extremity**

Exclusions: retinal varices (9B78.1)

Duodenal varices (DA52.0)

Coded Elsewhere: Gastric varices (DA43.0)

Oesophageal varices (DA26.0)

BD75.0 Sublingual varices

Varicose veins on the underside of the tongue

BD75.1 Scrotal varices

Inclusions: Varicocele of scrotum

BD75.2 Vulval varices

Congested and dilated vulval veins, occurring particularly in association with pregnancy.

Exclusions: complicating: childbirth and the puerperium (JB41)

Genital varices in pregnancy (JA61.1)

BD75.3 Pelvic varices

The presence of dilated and incompetent ovarian and pelvic veins in women. These may cause no symptoms but may be associated with chronic pelvic pain (pelvic congestion syndrome) or with externally apparent vulvovaginal varicosities.

BD75.Y Venous varicosities of other specified sites

BD75.Z Venous varicosities of unspecified site

BD7Y **Other specified diseases of veins**

BD7Z **Diseases of veins, unspecified**

Disorders of lymphatic vessels or lymph nodes (BD90-BD9Z)

Disorders due to developmental and acquired disturbances of lymph circulation and drainage and to infective disorders of lymph vessels and nodes.

Exclusions: Enlarged lymph nodes (MA01)

Coded Elsewhere: Lymphatic malformations (LA90.1)

BD90 **Lymphadenitis**

Exclusions: human immunodeficiency virus [HIV] disease resulting in generalized lymphadenopathy (1C60-1C62.Z)

Enlarged lymph nodes (MA01)

lymphadenopathy (MA01)

Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z)

BD90.0 **Acute lymphadenitis**

Exclusions: Nonspecific mesenteric lymphadenitis (BD90.1)

Chronic lymphadenitis (BD90.2)

human immunodeficiency virus [HIV] disease resulting in generalized lymphadenopathy (1C60-1C62.Z)

enlarged lymph nodes (MA01)

BD90.1 **Nonspecific mesenteric lymphadenitis**

BD90.2 **Chronic lymphadenitis**

Exclusions: Enlarged lymph nodes (MA01)

Nonspecific mesenteric lymphadenitis (BD90.1)

Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically or histologically (1B10.0)

Tuberculosis of intrathoracic lymph nodes, without mention of bacteriological or histological confirmation (1B10)

Tuberculous peripheral lymphadenopathy (1B12.6)

BD90.20 Chronic cervical lymphadenitis

BD90.21 Chronic axillary lymphadenitis

BD90.22 Chronic inguinal lymphadenitis

BD90.2Y Other specified chronic lymphadenitis

BD90.2Z Chronic lymphadenitis, unspecified

BD90.Y **Other specified lymphadenitis**

BD90.Z **Lymphadenitis, unspecified**

BD91 Lymphangitis

Lymphangitis is an inflammation of lymphatic vessels. It is most often caused by infection from bacteria, virus or fungus or infiltration by cancer cells.

Coding Note: Code first any underlying infection.

Exclusions: Lymphocutaneous sporotrichosis (1F2J.0)

Coded Elsewhere: Ascending bacterial lymphangitis (1B70.3)

Sclerosing lymphangitis of penis (GB06.5)

BD92 Lymphangiectasia

BD92.0 **Intestinal lymphangiectasia**

Intestinal lymphangiectasia is a pathologic dilation of lymph vessels of intestinal mucosa. This results in lymph leakage into the small bowel lumen and responsible for protein-losing enteropathy.

Coded Elsewhere: Primary intestinal lymphangiectasia (LB15.Y)

BD92.1 **Cutaneous lymphangiectasia**

BD93 **Lymphoedema**

Swelling due to the excess accumulation of lymph in the tissues caused by inadequate lymph drainage. It typically affects the extremities but may involve any body site. It is disfiguring and increases susceptibility to recurrent infection and local malignancy.

BD93.0 **Primary lymphoedema**

Lymphoedema as a result of lymphatic vessel hypoplasia

Coded Elsewhere: Yellow nail syndrome (EE11.1)

Noonan syndrome (LD2F.15)

BD93.1 **Secondary lymphoedema**

Lymphoedema as a result of an identifiable cause that renders insufficient the function of existing lymphatic vessels.

Coding Note: Code also the causing condition

BD93.10 Lymphoedema due to venous insufficiency

Permanent lymphoedema, usually of the lower extremities, resulting from venous hypertension and chronic gravitational oedema.

Coding Note: Code also the causing condition

BD93.11 Lymphoedema due to dependency and immobility

Lymphoedema occurring in immobile individuals with reduced muscle pump activity as a result of paralysis or infirmity. It is particularly liable to develop in those who are unable to sleep recumbent.

Coding Note: Code also the causing condition

BD93.12 Lymphoedema due to obesity

Lymphoedema resulting from morbid obesity. Lymphoedema of the lower limbs and lymphoedema of the abdominal apron fold are common sequelae of chronic morbid obesity.

Coding Note: Code also the causing condition

BD93.13 Lymphoedema due to lymphatic filariasis

Lymphoedema resulting from infestation of lymphatics by nematode worms of the genera Wuchereria and Brugia. This is the commonest cause of lymphoedema worldwide. The lymphoedema may present years after initial infection and most commonly affects the legs and male genitalia.

Coding Note: Code also the causing condition

BD93.14 Lymphoedema due to podoconiosis

Lymphoedema of the lower limbs resulting from an inflammatory response within lymphatic vessels to mineral particles from soil in genetically susceptible individuals. It is a leading cause of lower limb lymphoedema in farmers in Africa, Central America and India.

Coding Note: Code also the causing condition

BD93.15 Lymphoedema due to malignant infiltration

Lymphoedema resulting from obstruction of draining lymphatics as a result of infiltration by malignant, usually metastatic cells.

Coding Note: Code also the causing condition

BD93.1Y Lymphoedema secondary to other specified cause

Coding Note: Code also the causing condition

BD93.1Z Secondary lymphoedema, unspecified

Coding Note: Code also the causing condition

BD93.Y **Other specified forms of lymphoedema**

BD93.Z **Lymphoedema, unspecified**

BD9Y **Other specified disorders of lymphatic vessels or lymph nodes**

BD9Z **Disorders of lymphatic vessels or lymph nodes, unspecified**

Postprocedural disorders of circulatory system (BE10-BE1F.1)

This refers to postprocedural disorders of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis, not elsewhere classified.

Coded Elsewhere: Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

Prosthetic valve disease (BC01)

Coronary artery fistula, acquired (BA83)

Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)

Postprocedural complete atrioventricular block (BC63.21)

Postprocedural obstructed systemic venous pathway (BD73.2Y)

Postprocedural left pulmonary artery stenosis (BB02.3)

Postprocedural inferior caval vein complication (BD73.0)

Postprocedural superior caval vein complication (BD73.1)

Postoperative junctional ectopic tachycardia (BC81.1)

BE10 **Postcardiotomy syndrome**

Postcardiotomy syndrome is a hypersensitivity reaction to antigen derived from injured myocardium 3 weeks to 2 months after myocardial infarction, cardiac surgery, or penetrating and non penetrating heart injury. The diagnosis is made by history of heart injury, and exclusion of other diseases such as congestive heart failure, recurrent myocardial infarction, endocarditis, myocarditis, and pericarditis.

BE11 **Other functional disturbances following cardiac surgery**

BE12 **Postprocedural valve disorders**

BE12.0 **Postprocedural mitral valve stenosis**

BE12.1 **Postprocedural mitral valve insufficiency**

This is a postprocedural disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle, through the mitral valve, and into the left atrium, when the left ventricle contracts, i.e. there is regurgitation of blood back into the left atrium.

BE12.2 **Postprocedural aortic valve stenosis**

Coded Elsewhere: Stenosis of the neoaortic valve of pulmonary origin (BC02.30)

BE12.3 **Postprocedural aortic valve insufficiency**

This refers to postprocedural aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle.

Coded Elsewhere: Insufficiency of the neoaortic valve of pulmonary origin (BC02.31)

BE12.4 **Postprocedural tricuspid valve stenosis**

BE12.5 **Postprocedural tricuspid valve insufficiency**

This refers to the postprocedural failure of the heart's tricuspid valve to close properly during systole. As a result, with each heart beat some blood passes from the right ventricle to the right atrium, the opposite of the normal direction.

BE12.6 **Postprocedural pulmonary valve stenosis**

BE12.7 **Postprocedural pulmonary valve insufficiency**

BE13 Postprocedural true or false aortic aneurysm

This refers to postprocedural true and false swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location.

BE14 Postprocedural disorder of circulatory system following repair of congenital heart or great vessel anomaly

BE14.4 **Acquired abnormality of the neopulmonary valve**

A postnatal pathological change in form or function of the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.

BE14.40 Neopulmonary valve stenosis

Acquired obstruction to flow through the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.

Exclusions: Postprocedural pulmonary valve stenosis (BE12.6)

BE14.41 Neopulmonary valve regurgitation

Acquired backward flow through the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation

Exclusions: Postprocedural pulmonary valve insufficiency (BE12.7)

BE14.5 **Postprocedural right-sided atrioventricular valvar abnormality in double-inlet ventricle**

A postnatal pathological change in form or function of the right-sided atrioventricular valve in double inlet ventricle that occurred during or after an intervention.

Coding Note: Includes: right ventricular component and right-sided atrioventricular valve within a common atrioventricular junction (atrioventricular septal defect).

Exclusions: Congenital anomaly of an atrioventricular valve or atrioventricular septum (LA87)

BE14.6 **Postprocedural left-sided atrioventricular valvar abnormality in double-inlet ventricle**

A postnatal pathological change in form or function of the left-sided atrioventricular valve in double inlet ventricle that occurred during or after an intervention.

Coding Note: Includes: left ventricular component and left-sided atrioventricular valve within a common atrioventricular junction (atrioventricular septal defect) in the setting of double inlet ventricle

Exclusions: Congenital anomaly of an atrioventricular valve or atrioventricular septum (LA87)

BE14.7 **Postprocedural common atrioventricular valvar abnormality in double-inlet ventricle**

A postnatal pathological change in form or function of the common atrioventricular valve in double inlet ventricle that occurred during or after an intervention.

BE14.8 **Postprocedural ventricular septal defect disorder**

An event or occurrence affecting a ventricular septal defect that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

BE14.9 **Postprocedural aortic disorder related to congenital heart anomaly**

An event or occurrence affecting the aorta consequent to the presence of congenital cardiovascular disease, that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

BE14.A **Postprocedural arterial duct disorder**

An event or occurrence affecting the arterial duct (ductus arteriosus) that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

BE14.B **Postprocedural disorder following cardiovascular conduit or shunt procedure**

BE15 **Postprocedural pulmonary arterial tree disorder**

An event or occurrence affecting the pulmonary arterial tree that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

BE15.0 Postprocedural pulmonary trunk stenosis

Discrete narrowing of the luminal diameter of the pulmonary trunk (main pulmonary artery) (below the lower limit of normal adjusted for body size) that occurs during or after an intervention.

BE15.1 Postprocedural right pulmonary artery stenosis

Discrete narrowing of the luminal diameter of one or more segments of the right pulmonary artery (below the lower limit of normal adjusted for body size) that occurs during or after an intervention.

BE16 **Postprocedural pulmonary venous disorder**

An event or occurrence affecting one or more pulmonary vein(s) that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

BE17 **Postprocedural residual or recurrent interatrial communication**

A persistent or recurrent hole or pathway between the atrial chambers, including intentional residual communications.

BE19 **Postprocedural ventricular abnormality**

BE1A **Cardiac transplant associated coronary allograft vasculopathy**

Coronary artery initimal proliferation following cardiac transplantation, defined based on a combination of visual angiographic vessel descriptors in concert with measures of cardiac allograft function, according to the International Society for Heart and Lung Transplantation.

BE1B **Lymphoedema due to surgery or radiotherapy**

Lymphoedema resulting from damage to draining lymphatics as a result of surgery or radiotherapy.

BE1B.0 Postmastectomy lymphoedema syndrome

BE1B.1 Lymphoedema due to other medical or surgical procedures

BE1C **Inferior caval vein obstruction due to foreign body**

A postnatal pathologic condition of the inferior caval vein (inferior vena cava) in which flow is impeded or blocked by a foreign body.

BE1D **Superior caval vein obstruction due to foreign body**

A postnatal pathologic condition of the superior caval vein (superior vena cava) in which flow is impeded or blocked by a foreign body.

BE1E **Postprocedural right atrial complication**

An event or occurrence affecting the morphologically right atrium that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome

BE1E.0 Postprocedural right atrial perforation

Perforation of the morphologically right atrial wall that occurred during or after an intervention

BE1E.1 Right atrial erosion due to implanted device

Injury of the morphologically right atrial wall occurring as a direct result of chronic friction from an implanted device or wire

BE1F **Postprocedural left atrial complication**

An event or occurrence affecting the morphologically left atrium that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome

BE1F.0 Postprocedural left atrial perforation

Perforation of the morphologically left atrial wall that occurred during or after an intervention

BE1F.1 Left atrial erosion due to implanted device

Injury of the morphologically left atrial wall occurring as a direct result of chronic friction from an implanted device or wire

BE2Y **Other specified diseases of the circulatory system**

BE2Z **Diseases of the circulatory system, unspecified**

CHAPTER 12

Diseases of the respiratory system

This chapter has 79 four-character categories.

Code range starts with CA00

Exclusions: Endocrine, nutritional or metabolic diseases (Chapter 05)

Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Certain conditions originating in the perinatal period (Chapter 19)

Certain infectious or parasitic diseases (Chapter 01)

Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Coded Elsewhere: Neoplasms of the respiratory system

Developmental respiratory diseases

Symptoms, signs or clinical findings of the respiratory system (MD10-MD6Y)

Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z)

Sleep-related breathing disorders (7A40-7A4Z)

Diseases of the respiratory system complicating pregnancy, childbirth or the puerperium (JB64.5)

This chapter contains the following top level blocks:

- Upper respiratory tract disorders
- Certain lower respiratory tract diseases
- Lung infections
- Lung diseases due to external agents
- Respiratory diseases principally affecting the lung interstitium
- Pleural, diaphragm or mediastinal disorders
- Postprocedural disorders of the respiratory system
- Neoplasms of the respiratory system
- Developmental respiratory diseases

Upper respiratory tract disorders (CA00-CA0Z)

This group of disorders refers to diseases of the upper airways (upper respiratory tract). The upper airways anatomically are complicated structures which extend from the airway openings at the nares and lips to the trachea. The term upper airways includes several anatomically distinct regions. The nose constitutes the upper segment, followed by the nasopharyngeal and oropharyngeal airways, which extend from the nasal choanae and oral cavity to the supraglottic space. The paranasal sinuses drain into the nasal cavities and are attached to the lateral, posterior, and superior aspects of the nose. The larynx divides the upper and lower airways, although some place it in the thoracic inlet.

Exclusions: Chronic obstructive pulmonary disease with acute exacerbation, unspecified (CA22.0)

CA00 Acute nasopharyngitis

A disease of the upper respiratory tract, caused by an infection with rhinovirus. This disease is characterised by pharyngitis, runny nose, stuffy nose, or cough. Transmission is by inhalation of infected respiratory secretions, or direct contact.

Exclusions: Chronic nasopharyngitis (CA09.1)

pharyngitis NOS (CA02)

Acute pharyngitis (CA02)

Chronic pharyngitis (CA09.2)

rhinitis NOS (CA09.0)

sore throat NOS (CA00-CA0Z)

Vasomotor rhinitis (CA08.3)

Chronic rhinitis (CA09.0)

Allergic rhinitis (CA08.0)

acute sore throat (CA02)

chronic sore throat (CA09.2)

CA01 Acute sinusitis

Recent onset and/or short duration inflammation of the mucosa in one or more of the paranasal sinuses (maxillary, ethmoid, frontal and sphenoid) arising from infection or other causes such as caries or injury to the teeth. Purulent discharge can be seen at the middle meatus and olfactory cleavage and patients complain of dysosmia, stuffy nose, fever, or localised tenderness or pain. Allergic rhinitis, nasal septum deformity or hypertrophic rhinitis are underlying diseases that may induce acute sinusitis.

Exclusions: sinusitis, chronic or NOS (CA0A)

CA02 **Acute pharyngitis**

Acute pharyngitis is defined as an infection or irritation of the pharynx and/or tonsils and is a part of the common cold symptoms. The etiology is usually infectious, with most cases being of viral origin. Although virus infection is the primary cause, it is also caused by bacterial infection. The discomfort of a throat, a throat pain and swallowing pain often occur. Headache, general fatigueness, radiating pain to the ear and a cervical lymphadenitis also occur. Local finding demonstrates hyperaemic palatine tonsils and swelling of lymphoid follicles of posterior wall of pharynx. Patients with acute pharyngitis present most commonly with a sore throat. Other various symptoms can rise in these patients depending on their causing organisms.

Inclusions: acute sore throat

Exclusions: Acute laryngopharyngitis (CA04)

Peritonsillar abscess (CA0K.1)

Chronic pharyngitis (CA09.2)

Retropharyngeal or parapharyngeal abscess (CA0K.0)

Coded Elsewhere: Streptococcal pharyngitis (1B51)

Meningococcal pharyngitis (1C1C.Y)

CA02.0 Acute pharyngitis due to other bacteria

Rapid onset inflammation of the pharynx, (back of the throat, between the tonsils and the voicebox (larynx)) due to a specifically identified organism not classified elsewhere.

Exclusions: Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z)

Coded Elsewhere: Gonococcal pharyngitis (1A72.3)

CA02.1 Acute viral pharyngitis

Coded Elsewhere: Enteroviral vesicular pharyngitis (1F05.1)

CA02.10 Pharyngitis due to Adenovirus

Pharyngitis is an inflammation of the mucous membranes and underlying structures of the throat. Adenoviral pharyngitis is a self-limiting disease associated with fever, erythema of the pharynx, enlarged tonsils with exudate and enlarged cervical lymph nodes accompanied by fever, malaise, myalgia and abdominal pain. Frequently occurs with self-limiting conjunctivitis (refer to pharyngoconjunctival fever), laryngotracheitis, bronchitis and pneumonia.

CA02.1Y Other specified acute viral pharyngitis

CA02.1Z Acute viral pharyngitis, unspecified

CA02.Y Other specified acute pharyngitis

CA02.Z Acute pharyngitis, unspecified

CA03 Acute tonsillitis

Exclusions: Streptococcal pharyngitis (1B51)

Acute pharyngitis (CA02)

Peritonsillar abscess (CA0K.1)

CA03.0 Streptococcal tonsillitis

A disease of the tonsils, caused by an infection with the gram-positive bacteria Streptococcus pyogenes (Streptococcus group A). This disease is characterised by a sore throat, fever, tonsillar exudates, or cervical adenopathy. This disease may also present with odynophagia, dysphagia, otalgia, dry tongue, erythematous, enlarged tonsils, or yellowish white spots on the tonsils. Transmission is commonly by inhalation of infected respiratory secretions or indirect contact. Confirmation is by identification of Streptococcus group A from a throat swab.

CA03.Y Other specified acute tonsillitis

CA03.Z Acute tonsillitis, unspecified

CA04 Acute laryngopharyngitis

The most common upper respiratory tract infection is the common cold however, infections of laryngopharynx is also considered upper respiratory tract infections, of multiple sites.

CA05 Acute laryngitis or tracheitis

Acute laryngitis and tracheitis are defined respectively as acute inflammation of larynx and trachea, with local findings of erythema, and oedema of laryngeal and tracheal mucosa. Acute laryngitis and tracheitis are induced by upper respiratory tract viral infections or voice abuse.

Exclusions: Laryngismus (stridulus) (CA0H.4)

Acute obstructive laryngitis or epiglottitis (CA06)

CA05.0 Acute laryngitis

Rapid onset inflammation of the laryngeal mucosa, including the vocal cords. It is frequently characterised by irritation, oedema, and reduced pliability of the mucosa.

Exclusions: Chronic laryngitis (CA0G)

Acute obstructive laryngitis or epiglottitis (CA06)

CA05.1 Acute tracheitis

This condition refers to the acute inflammation of the trachea.

Exclusions: Chronic tracheitis (CA20.1)

Coded Elsewhere: Neonatal tracheitis (KB25)

CA05.2 Acute laryngotracheitis

Acute laryngotracheitis refers to the acute inflammation of both the larynx (laryngitis) and trachea (tracheitis).

Exclusions: Chronic laryngitis or laryngotracheitis (CA0G)

CA06 Acute obstructive laryngitis or epiglottitis

CA06.0 **Acute obstructive laryngitis**

A condition commonly caused by an acute viral infection of the upper airway. This condition is characterised by a barking cough, stridor, hoarseness, or difficulty breathing. Transmission is commonly by inhalation of infected respiratory secretions.

Inclusions: croup

CA06.1 **Acute epiglottitis**

Acute epiglottitis is a special type of laryngeal inflammation, being characterised with a local swelling of epiglottis mucosa. Haemophilus influenzae type B infection is considered an important causative factor. Particularly in children, rapid exacerbation of dyspnoea can occur a couple of hours after the onset of this disease.

CA06.Z **Acute obstructive laryngitis or epiglottitis, unspecified**

CA07 Acute upper respiratory infections of multiple and unspecified sites

Exclusions: Influenza, virus not identified (1E32)

influenza virus, identified (1E30)

CA07.0 **Acute upper respiratory infection, site unspecified**

CA07.1 **Acute upper respiratory infections of multiple sites**

Coding Note: Assign additional codes for the specific infections.

CA08 Vasomotor or allergic rhinitis

Rhinitis is inflammation of the nasal mucosa clinically characterised by major symptoms: sneezing, nasal pruritus, running nose, and stuffy nose.

Allergic rhinitis is an inflammation of nasal airway triggered by allergens to which the affected individual has previously been sensitized. Pathogenesis of allergic rhinitis is type I allergy on the nasal mucosa. Antigens inhaled into sensitized nasal mucosa bind to IgE antibodies on mast cells, which release chemical mediators such as histamine and peptide leukotriene. Consequently terminal of sensory neurons and vessels react to induce sneezing, running nose, and stuffy nose (immediate phase reaction). In late phase reaction, various chemical mediators are produced by mast cells, cytokines are produced by Th2 and mast cells, and chemokines are produced by epithelial cells, endothelium of blood vessels, and fibrocytes, respectively. These cell-derived transmitters actually induce various cell types of inflammatory cell infiltration to nasal mucosa. Among them, activated eosinophils is the main player of mucosal swelling and hyperreactivity.

Non-allergic rhinitis is an inflammation of nasal mucosa in which allergic mechanisms are not involved. It covers many different phenotypes.

Exclusions: rhinitis NOS (CA09.0)

CA08.0 **Allergic rhinitis**

Allergic rhinitis is an inflammation of nasal airway triggered by allergens to which the affected individual has previously been sensitized. Pathogenesis of allergic rhinitis is type I allergy on the nasal mucosa. Antigens inhaled into sensitized nasal mucosa bind to IgE antibodies on mast cells, which release chemical mediators such as histamine and peptide leukotriene. Consequently terminal of sensory neurons and vessels react to induce sneezing, running nose, and stuffy nose (immediate phase reaction). In late phase reaction, various chemical mediators are produced by mast cells, cytokines are produced by Th2 and mast cells, and chemokines are produced by epithelial cells, endothelium of blood vessels, and fibrocytes, respectively. These cell-derived transmitters actually induce various cell types of inflammatory cell infiltration to nasal mucosa. Among them, activated eosinophils is the main player of mucosal swelling and hyperreactivity.

CA08.00 Allergic rhinitis due to pollen

This condition is an allergic inflammation of the nasal airways. It occurs when an allergen, such as pollen, is inhaled by an individual with a sensitized immune system.

Inclusions: Pollinosis

CA08.01 Allergic rhinitis due to other seasonal allergens

This refers to other allergic inflammation of the nasal airways in patients with proven allergy to other allergens besides pollens and house dust mite, with multiple sensitization or as a component of complex conditions such as latex allergy. Clinically characterised by major symptoms: sneezing, nasal pruritus, running nose, and stuffy nose. It occurs when an allergen, such as animal dander (particles of shed skin and hair), insect (cockroach body particles), fungal particles, is inhaled by an individual with a sensitized immune system.

CA08.02 Allergic rhinitis due to house dust mite

Allergic rhinitis triggered by the exposure to house dust mite allergens to which the affected individual has previously been sensitized.

CA08.03 Other allergic rhinitis

This refers to other allergic inflammation of the nasal airways. It occurs when an allergen, such as pollen, dust or animal dander (particles of shed skin and hair) is inhaled by an individual with a sensitized immune system.

CA08.0Z Allergic rhinitis, unspecified

CA08.1 **Non-allergic rhinitis**

Non-allergic rhinitis is an inflammation of nasal mucosa in which allergic mechanisms are not involved. It covers many different phenotypes.

Coded Elsewhere: Drug-induced rhinitis (4A85.0Y)

CA08.10 Non-allergic rhinitis with eosinophils

The non-allergic rhinitis with eosinophils is characterised by large numbers (inconsistently defined as >5% to >20%) of eosinophils on nasal smear. Patients usually have paroxysmal exacerbations of symptoms, including sneezing, profuse watery rhinorrhoea, nasal pruritus, nasal congestion, and occasional anosmia. It may precede the development of nasal polyposis and aspirin hypersensitivity. Patients with non-allergic rhinitis with eosinophils are at increased risk for the development of obstructive sleep apnoea.

CA08.1Y Other specified non-allergic rhinitis

CA08.1Z Non-allergic rhinitis, unspecified

CA08.2 Mixed rhinitis

Mixed rhinitis is a specific rhinitis subtype that combines characters of allergic rhinitis and non-infectious non-allergic rhinitis. It may represent between 50 and 70% of all allergic rhinitis cases.

CA08.3 Vasomotor rhinitis

Vasomotor rhinitis is a form of non-allergic inflammation of the nasal mucosa that is characterised by nasal congestion and posterior pharyngeal drainage. The non-allergic triggers cause dilation of the blood vessels in the lining of the nose, which results in swelling, and drainage.

CA08.Y Mixed allergic and non-allergic rhinitis

CA08.Z Rhinitis, unspecified whether allergic or nonallergic

CA09 Chronic rhinitis, nasopharyngitis or pharyngitis

The pathological condition of chronic rhinitis is a continuation of persistent inflammation on nasal turbinate mucosae, which is induced by microbial infection, irritation with inhaled substances and abnormal structure of nasal cavity. This condition induces nasal obstruction and increased nasal discharge. Pharyngitis is an inflammation of whole pharyngeal mucosa and lymphatic tissues and its acute symptoms are a part of the common cold symptoms. Although viral infection is the primary cause, it is also caused by bacterial infections. The discomfort of throat, throat pain and swallowing pain occur. Headache, general fatigueness, radiating pain to the ear and a cervical lymphadenitis also occur. Local finding demonstrates hyperaemic palatine tonsils and swelling of lymphoid follicles of posterior wall of pharynx. Chronic pharyngitis can be considered as a consequence of acute pharyngitis or effect of continuous stimuli, with symptoms of abnormal sensation of throat, discomfort, and foreign body sensation.

CA09.0 Chronic rhinitis

Persistent or recurrent inflammation of the nasal mucosa.

Exclusions: Vasomotor rhinitis (CA08.3)

Allergic rhinitis (CA08.0)

CA09.1 **Chronic nasopharyngitis**

Persistent or recurrent inflammation of the top portion of the pharynx situated posterior to the nose and superior to the soft palate, usually including its mucosa, related lymphoid structure, and glands.

Exclusions: Acute nasopharyngitis (CA00)

CA09.2 **Chronic pharyngitis**

Persistent or recurrent inflammation of the pharynx; the funnel-shaped fibromuscular tube which conducts food to the oesophagus and air to the larynx.

Inclusions: Chronic sore throat

Exclusions: Acute pharyngitis (CA02)

CA0A Chronic rhinosinusitis

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses secondary to both infectious and allergic mechanisms. The retention of sinus secretions is the most important event in the development of sinusitis. This creates a favourable milieu for the growth of infection agents and may be caused by the obstruction or narrowing of sinus ostia, mucociliary dysfunction and changes in mucus composition. 90% of sinus infections involve the maxillary sinus. Chronic sinusitis refers to symptom duration lasting 3 months or more. Diagnosis of sinusitis is based on past history and physical examination findings. The CT scan is the most sensitive technique in evaluating sinus disease. The goals of management of chronic sinusitis are to eradicate infection, to relieve ostiomeatal obstruction, to normalize mucociliary clearance, and to prevent complications. When pharmaceutical treatment does not have any remarkable improvement or when a surgical approach can be chosen as patient's complication, surgical intervention should be aimed to establish an effective sinus drainage from the ostium. . Functional endoscopic sinus surgery (FESS) describes endoscopic techniques that have revolutionized the approach to sinus disease. The procedure is aimed at restoring the functional physiology of sinus aeration and drainage via the expanded ostiomeatal complex while minimizing surgical alteration of the normal anatomic pathways.

Exclusions: Acute sinusitis (CA01)

CA0A.0 **Samter syndrome**

Samter syndrome is composed of asthma, aspirin intolerance, nasal polyps and chronic rhinosinusitis.

CA0A.Y **Other specified chronic rhinosinusitis**

CA0A.Z **Chronic rhinosinusitis, unspecified**

CA0B Silent sinus syndrome

Silent sinus syndrome is a spontaneous, asymptomatic collapse of the maxillary sinus and orbital floor associated with negative sinus pressures.

CA0C **Cyst or mucocele of nose or nasal sinus**

A condition which refers to diseases of the nose and nasal sinus that cause a cyst or mucocele.

A mucocele is any dilatation (typically pathologic) with accumulation of mucus. Mucoceles are benign, epithelium-lined cysts filled with mucus, which can form in the paranasal sinuses. These structures may cause symptoms if sufficiently large or if exerting pressure on surrounding anatomic structures. Symptomatic mucoceles typically require surgical intervention. Mucoceles should be differentiated from sinus retention cysts. Unlike mucoceles, sinus retention cysts do not result in expansion and thinning of the bony sinus walls.

CA0D **Deviated nasal septum**

CA0E **Hypertrophy of nasal turbinates**

CA0F **Chronic diseases of tonsils or adenoids**

Any persistent or recurrent disease affecting the round-to-oval mass of lymphoid tissue embedded in the lateral wall of the pharynx (tonsils) or the collection of lymphoid nodules on the posterior wall and roof of the nasopharynx (adenoids)

Exclusions: Recurrent acute tonsillitis (CA03)

CA0F.0 **Hypertrophy of tonsils**

Inclusions: Enlargement of tonsils

CA0F.1 **Hypertrophy of adenoids**

Inclusions: Enlargement of adenoids

CA0F.3 **Hypertrophy of tonsils with hypertrophy of adenoids**

This is an excessive growth ("hypertrophy") of the tissue of tonsils and adenoids.

CA0F.Y **Other specified chronic diseases of tonsils or adenoids**

CA0F.Z **Chronic diseases of tonsils or adenoids, unspecified**

CA0G **Chronic laryngitis or laryngotracheitis**

Persistent or recurrent inflammation of the larynx (airway) and/or the larynx and the cartilaginous and membranous tube descending from the larynx and branching into the right and left main bronchi (trachea).

CA0H **Diseases of vocal cords or larynx, not elsewhere classified**

Exclusions: stridor: NOS (MD11.B)

laryngitis: ulcerative (CA05.0)

Acute obstructive laryngitis (CA06.0)

Postprocedural subglottic stenosis (CB62)

CA0H.0 **Paralysis of vocal cords or larynx**

Loss of function or feeling of one or both of the vocal folds, often caused by injury or disease to the nerves of the larynx.

Coded Elsewhere: Acquired vocal cord paralysis in newborn (KB2H)

Congenital laryngeal palsy (LA71.Y)

CA0H.1 **Polyp of vocal cord or larynx**

A polyp is an abnormal growth of tissue projecting from a mucous membrane, in this condition it is of the vocal cord and larynx.

Exclusions: adenomatous polyps (2F00)

CA0H.2 **Nodules of vocal cords**

CA0H.3 **Oedema of larynx**

Laryngeal oedema is oedema (accumulation of fluid) which may occur for example in asaryepiglottic folds, epiglottis, the arytenoid region or submucosal of the subglottic region. It may occur due to anaphylaxis, angioneurotic oedema, larynx infection, foreign body or substance, or injury.

Exclusions: oedematous laryngitis (CA05.0)

laryngitis: acute obstructive [croup] (CA06.0)

CA0H.4 **Laryngeal spasm**

Laryngeal spasm is a pathological condition that is mainly a spasmodic closure (spasm) of the inlet portion of the larynx or the glottic region. There is an adult-onset and childhood (infant)-onset generally in this disease. There is a difference in the pattern of expression for these two types. In the infant, respiratory arrest is associated with this condition and spasmodic closure of the glottis occurs suddenly, and then breathing returns to original quite rapidly within a few minutes. In adults, the main symptoms of this condition are difficulty breathing or inspiratory stridor rather than a complete respiratory arrest.

Inclusions: laryngospasm

CA0H.5 **Stenosis of larynx**

Laryngeal stenosis is an abnormal narrowing within the cavity of the larynx.

CA0H.Y **Other specified diseases of vocal cords or larynx, not elsewhere classified**

CA0H.Z **Diseases of vocal cords or larynx, not elsewhere classified, unspecified**

CA0J Nasal polyp

Nasal polyp is an inflammatory and proliferating mass arising from the epithelial linings of nasal cavity and paranasal sinuses. In general, nasal polyp appears to be greyish white, smoothly surfaced, and glutinous and agar-like mass. The pathogenesis is thought to be multifactorial.

Exclusions: adenomatous polyps (2F00)

CA0J.0 **Polypoid sinus degeneration**

Also referred to as Woakes' syndrome or ethmoiditis. Woakes' syndrome is characterised by severe recurrent nasal polyps, often without eosinophils on histological examination and with broadening of the nose.

CA0J.Y **Other specified nasal polyp**

CA0J.Z **Nasal polyp, unspecified**

CA0K **Abscess of upper respiratory tract**

Abscess of upper respiratory tract is defined as abscess formation which occurs from nose to pharynx and larynx. Abscess, furuncle and carbuncle of nose, retropharyngeal, parapharyngeal abscess and other abscess of pharynx are included in this classification.

CA0K.0 **Retropharyngeal or parapharyngeal abscess**

A retropharyngeal abscess is an abscess located in the tissues in the back of the throat behind the posterior pharyngeal wall (the retropharyngeal space). A parapharyngeal abscess is an abscess developing in the potential space in the head and the neck.

Exclusions: Peritonsillar abscess (CA0K.1)

CA0K.1 **Peritonsillar abscess**

Peritonsillar abscess is defined with abscess formation between the tonsillar capsule and the tonsillar constrictor muscles. Peritonsillar abscess mostly comes from peritonsillitis. Fever rise, pharyngeal pain and swallowing pain are the main symptoms, but, it also causes a muffled voice. Uvula is deviated to the unaffected side and swelling and redness around the affected tonsil is remarkable. Bacterial examination from the peritonsillar pus often reveal streptococcus group A beta-haemolytic as the aerobic bacteria and the detection rate of anaerobic bacteria also amounted to more than half. The treatment consists of antimicrobial therapy and incision and drainage of the abscess. The symptoms improve with above treatment in the most cases, while in some cases the abscess proceeds to a deadly deep neck infection and mediastinal abscess. If there are systemic complications such as diabetes mellitus, special attention is required.

Inclusions: Quinsy

Exclusions: Acute tonsillitis (CA03)

Chronic tonsillitis (CA0F)

tonsillitis, NOS (CA03)

retropharyngeal abscess (CA0K.0)

CA0K.Y **Other specified abscess of upper respiratory tract**

CA0K.Z **Abscess of upper respiratory tract, unspecified**

CA0Y **Other specified upper respiratory tract disorders**

CA0Z **Upper respiratory tract disorders, unspecified**

Certain lower respiratory tract diseases (CA20-CA2Z)

This group refers to diseases of airways that forms the connection between the outside world and the terminal respiratory unit. Intrapulmonary airways are divided into three major groups; bronchi, membranous bronchiole, and respiratory bronchiole/gas exchange ducts.

Coded Elsewhere: Acute tracheitis (CA05.1)
Whooping cough (1C12)
Chronic respiratory disease originating in the perinatal period (KB29)

CA20 **Bronchitis**

Bronchitis is inflammation of the main air passages to the lungs.

Coding Note: Excludes acute infectious bronchitis

Exclusions: bronchitis, asthmatic NOS (CA23.3)
bronchitis, chemical (acute) (CA81)

Coded Elsewhere: Acute bronchitis (CA42)

CA20.0 Acute noninfectious bronchitis

CA20.1 Chronic bronchitis

Exclusions: chronic asthmatic bronchitis (CA22.1)
chronic: bronchitis: with airways obstruction (CA22)
chronic: emphysematous bronchitis (CA22.1)
chronic: obstructive pulmonary disease NOS (CA22)

CA20.10 Simple chronic bronchitis

CA20.11 Mucopurulent chronic bronchitis

CA20.12 Mixed simple and mucopurulent chronic bronchitis

CA20.13 Protracted bacterial bronchitis

Protracted bacterial bronchitis (PBB) is a disease caused by the chronic infection of the conducting airways. The condition causes a persistent wet cough lasting more than four weeks that responds to antibiotic treatment.

CA20.1Y Other specified chronic bronchitis

CA20.1Z Chronic bronchitis, unspecified

CA20.Y Other specified bronchitis

Coding Note: Excludes acute infectious bronchitis

CA20.Z Bronchitis, unspecified

Coding Note: Excludes acute infectious bronchitis

CA21 Emphysema

Emphysema is defined by abnormal and permanent enlargement of the airspaces that are distal to the terminal bronchioles. This is accompanied by destruction of the airspace walls, without obvious fibrosis (i.e. there is no fibrosis visible to the naked eye). Emphysema can exist in individuals who do not have airflow obstruction; however, it is more common among patients who have moderate or severe airflow obstruction.

Exclusions:

- Compensatory emphysema (CB40.4)
- Interstitial emphysema originating in the perinatal period (KB27.0)
- emphysema due to inhalation of chemicals, gases, fumes or vapours (CA81)
- emphysema mediastinal (CB40.3)
- Traumatic subcutaneous emphysema, not elsewhere classified (NF0A.7)
- emphysema, surgical (subcutaneous) (NE81)
- emphysema with chronic (obstructive) bronchitis (CA22)
- emphysematous (obstructive) bronchitis (CA22.1)

CA21.0 MacLeod syndrome

Decrease in size of one lung due to obliterating bronchiolitis, a congenital abnormality of other disorder resulting in hyperinflation of the normal lung.

CA21.1 Panlobular emphysema

Panlobular (panacinar) emphysema destroys the entire alveolus uniformly and is predominant in the lower half of the lungs. Panlobular emphysema generally is observed in patients with homozygous alpha1-antitrypsin deficiency.

Inclusions:

- Panacinar emphysema

CA21.2 Centrilobular emphysema

Centrilobular (centriacinar) emphysema begins in the respiratory bronchioles and spreads peripherally. This form is associated with long-standing cigarette smoking and predominantly involves the upper half of the lungs.

CA21.Y Other specified emphysema

CA21.Z Emphysema, unspecified

CA22 Chronic obstructive pulmonary disease

Chronic Obstructive Pulmonary disease (COPD), a common preventable and treatable disease, is characterised by persistent airflow limitation that is usually progressive and associated with an enhanced chronic inflammatory response in the airways and the lung to noxious particles or gases. Exacerbations and comorbidities contribute to the overall severity in individual patients.

Exclusions: Emphysema (CA21)

chronic tracheobronchitis (CA20.1)

chronic tracheitis (CA20.1)

Simple or mucopurulent chronic bronchitis (CA20.1)

asthmatic bronchitis NOS (CA23.3)

Bronchiectasis (CA24)

Asthma (CA23)

chronic bronchitis NOS (CA20.1)

CA22.0 Chronic obstructive pulmonary disease with acute exacerbation, unspecified

An exacerbation of COPD is an acute event characterised by a worsening of the patient's respiratory symptoms that is beyond normal day-to-day variations and leads to a change in medication. Exacerbations of COPD can be precipitated by several factors. The most common causes appear to be viral upper respiratory tract infections and infection of the tracheobronchial tree. The diagnosis of an exacerbation relies exclusively on the clinical presentation of the patient complaining of an acute change of symptoms (baseline dyspnoea, cough, and/or sputum production) that is beyond normal day-to-day variation.

CA22.1 Certain specified chronic obstructive pulmonary disease

Coding Note: Use additional code to identify any associated respiratory tract infection.

Exclusions: Chronic obstructive pulmonary disease with acute exacerbation, unspecified (CA22.0)

CA22.Z Chronic obstructive pulmonary disease, unspecified

CA23 Asthma

Asthma is a chronic inflammatory disorder of the airways in which many cells and cellular elements play a role. It is characterised by an increased responsiveness of the trachea and bronchi to various stimuli and manifested by a widespread narrowing of the airways that change in severity either spontaneously or as a result of therapy. This leads to recurrent episodes of wheezing, breathlessness, chest tightness, and coughing, particularly at night or in the early morning.

Inclusions: Idiosyncratic asthma

Exclusions: wood asthma (CA70)

asthma with chronic obstructive pulmonary disease (CA22)

miner's asthma (CA60.1)

Wheezing (MD11.C)

chronic obstructive asthma (CA22)

chronic asthmatic (obstructive) bronchitis (CA22.1)

CA23.0 **Allergic asthma**

Allergic asthma is the most easily recognised asthma phenotype, which often commences in childhood and is associated with a past and/or family history of allergic disease such as eczema, allergic rhinitis, or food or drug allergy. Examination of the induced sputum of these patients before treatment often reveals eosinophilic airway inflammation. The main trigger is the exposure to inhaled allergens, such as dust mite and pollens, to which the affected individual has previously been sensitized. Patients with this asthma phenotype usually respond well to inhaled corticosteroid (ICS) treatment and specific allergen-immunotherapy.

CA23.00 Allergic asthma with exacerbation

This refers to acute or subacute episodes of progressively worsening shortness of breath, cough, wheezing, and chest tightness, or some combination of these symptoms in patients with proven allergic asthma. Allergic asthma can be exacerbated by allergens to which the individual is allergic, other exogenous factors such as respiratory infections, pollutants or climate change, or endogenous co-factors. Exacerbations are characterised by decreases in expiratory airflow that can be documented and quantified by simple measurement of lung function (spirometry or PEF), can vary widely among individuals and within individuals from rare to frequent. The severity of exacerbation of allergic asthma can vary from mild to very severe and life-threatening, but in general respond to standard treatments of bronchodilators (inhalers) and steroid

CA23.01 Allergic asthma with status asthmaticus

CA23.02 Allergic asthma, uncomplicated

CA23.1 **Non-allergic asthma**

Non-allergic asthma occur in some patients who have asthma that is not associated with allergy. The cellular profile of the sputum of these patients may be neutrophilic, eosinophilic or contain only a few inflammatory cells (paucigranulocytic). Patients with non-allergic asthma often respond less well to inhaled corticosteroids. It can cover different phenotypes.

CA23.10 Non-allergic asthma with exacerbation

CA23.11 Non-allergic asthma with status asthmaticus

CA23.12 Non-allergic asthma, uncomplicated

CA23.2 **Other specified forms of asthma or bronchospasm**

Coded Elsewhere: Asthmatic pulmonary eosinophilia (CB02.0)

Samter syndrome (CA0A.0)

CA23.20 Aspirin-induced asthma

In some asthma individuals, aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs) that inhibit cyclooxygenase 1 (COX-1) exacerbate the condition. This distinct clinical syndrome, called aspirin-induced asthma (AIA), is characterised by an eosinophilic rhinosinusitis, nasal polyposis, aspirin hypersensitivity, and asthma.

CA23.21 Exercise-induced bronchospasm

Exercise-induced bronchoconstriction (EIB) describes airway narrowing that occurs in association with exercise. EIB occurs in up to 90% of asthmatic patients and is estimated to occur in >10% of the general population. Recent reviews have identified asthma as a risk factor for sudden death and have reported many deaths that have been attributed directly to EIB.

CA23.22 Cough variant asthma

Cough variant asthma is an occult form of asthma in which the only sign or symptom is chronic cough.

CA23.3 **Unspecified asthma**

CA23.30 Unspecified asthma with exacerbation

This refers to an unspecified inflammatory disease of the airways characterised by variable and recurring symptoms, reversible airflow obstruction, and bronchospasm, with an acute sudden worsening.

CA23.31 Unspecified asthma with status asthmaticus

This refers to an unspecified inflammatory disease of the airways characterised by variable and recurring symptoms, reversible airflow obstruction, and bronchospasm, with an acute exacerbation of asthma that does not respond to standard treatments of bronchodilators(inhalers) and steroids.

Exclusions: acute asthma NOS (CA23.32)

severe asthma NOS (CA23.32)

CA23.32 Unspecified asthma, uncomplicated

Exclusions: acute severe asthma (CA23.31)

CA24 Bronchiectasis

Bronchiectasis is an abnormal widening of one or more airways. Normally, tiny glands in the lining of the airways make a small amount of mucus. Mucus keeps the airways moist and traps any dust and dirt in the inhaled air. Because bronchiectasis creates an abnormal widening of the airways, extra mucus tends to form and pool in parts of the widened airways. Widened airways with extra mucus are prone to infection.

Exclusions: tuberculous bronchiectasis, confirmed (1B10.0)

Respiratory tuberculosis, not confirmed (1B10.1)

CA25 Cystic fibrosis

Cystic fibrosis (CF) is a genetic disorder characterised by the production of sweat with a high salt content and mucus secretions with an abnormal viscosity. The disease is chronic and generally progressive, with onset usually occurring during early childhood or, occasionally, at birth (meconium ileus). Virtually any internal organ may be involved but the principle manifestations concern the breathing apparatus (chronic bronchitis), pancreas (pancreatic insufficiency, adolescent diabetes and occasionally pancreatitis) and, more rarely, the intestine (stercoral obstruction) or liver (cirrhosis). The usual presenting symptoms and signs include persistent pulmonary infection, pancreatic insufficiency, and elevated sweat chloride levels. However, many patients demonstrate mild or atypical symptoms, and clinicians should remain alert to the possibility of CF even when only a few of the usual features are present. Both criteria; clinical symptoms consistent with CF in at least one organ system and evidence of cystic fibrosis transmembrane conductance regulator (CFTR) dysfunction must be met to diagnose cystic fibrosis.

Inclusions: mucoviscidosis

CA25.0 Classical cystic fibrosis

Coded Elsewhere: Exocrine pancreatic manifestations of classical cystic fibrosis (DC30.Y)

Endocrine pancreatic manifestations of classical cystic fibrosis (DC30.Y)

CA25.1 Atypical cystic fibrosis

Coded Elsewhere: Endocrine pancreatic manifestations of atypical cystic fibrosis (DC30.Y)

CA25.2 Subclinical cystic fibrosis

Coding Note: Cystic fibrosis with no clinical manifestations is coded here.

Inclusions: Asymptomatic cystic fibrosis

CA25.Z Cystic fibrosis, unspecified

CA26 Chronic bronchiolitis

Bronchiolitis and bronchiolitis obliterans are general terms used to describe a nonspecific inflammatory injury that primarily affects the small airways and generally spares the interstitium. Bronchiolitis may be caused by inhalation injury, infection, or drugs; associated with organ transplantation or connective tissue disease; or may be idiopathic. The main pathologic categories of bronchiolitis are: constrictive, proliferative, follicular, airway-centred interstitial fibrosis, and diffuse panbronchiolitis. The constrictive and proliferative patterns may occur together.

CA26.0 Chronic obliterative bronchiolitis

Bronchiolitis obliterans is commonly used to describe a number of unrelated conditions whose common end point is functional obstruction of bronchioles. A typical form is constrictive bronchiolitis. Constrictive bronchiolitis is an uncommon histologic finding characterised by alterations in the walls of membranous and respiratory bronchioles, often without extensive changes in alveolar ducts and alveolar walls. These changes lead to concentric narrowing or complete obliteration of the airway lumen. The clinical manifestations of constrictive bronchiolitis usually include progressive airflow obstruction, sometimes in the presence of a relatively normal chest radiograph. The clinical severity depends upon the type, extent, and severity of the initial lung injury.

Exclusions: Respiratory conditions due to inhalation of chemicals, gases, fumes or vapours (CA81)

CA26.1 Diffuse panbronchiolitis

Diffuse panbronchiolitis (DPB) is an idiopathic inflammatory disease principally affecting the respiratory bronchioles, causing a progressive suppurative and severe obstructive respiratory disorder. Onset occurs in the second to fifth decade of life and manifests by chronic cough, exertional dyspnoea, and sputum production. Most patients also have chronic paranasal sinusitis. If left untreated, DPB progresses to bronchiectasis, respiratory failure and death. A significant improvement in the prognosis has been reported thanks to the use of long-term therapy with macrolide antibiotics, the effect of which is attributed to an anti-inflammatory and immunoregulatory action.

CA26.Y Other specified chronic bronchiolitis

CA26.Z Chronic bronchiolitis, unspecified

CA27 Tracheobronchitis

Tracheobronchitis is inflammation of the trachea and bronchi.

Coded Elsewhere: Relapsing polychondritis (FB82.3)

CA27.0 Tracheobronchopathia osteochondroplastica

Tracheobronchopathia osteochondroplastica is a rare disorder of unknown cause, seen with a frequency of 0.4 percent at bronchoscopy, affecting the large airways. It is characterised by the development of multiple osseous and cartilaginous submucosal nodules connected to tracheal cartilage. The abnormality spares the posterior tracheal membranous wall. In spite of marked radiographic changes, patients are only rarely symptomatic since severe airway obstruction is unusual. Linear tracheoplasty may be required in patients with symptomatic airway obstruction.

CA27.1 Tracheobronchomegaly

Tracheobronchomegaly is a disorder of unknown cause defined by dilatation of trachea and large bronchi presenting in adults.

CA27.Y Other specified tracheobronchitis

CA27.Z Tracheobronchitis, unspecified

CA2Y Other specified lower respiratory tract disease

CA2Z **Lower respiratory tract disease, unspecified**

Lung infections (CA40-CA4Z)

Any condition of the lungs, caused by an infection with a bacterial, viral, fungal, or parasitic source.

Coded Elsewhere: Influenza (1E30-1E32)

Pulmonary histoplasmosis capsulati (1F2A.0)

Chronic obstructive pulmonary disease with acute lower respiratory infection (CA22.1)

Influenza with pneumonia, seasonal influenza virus identified (1E30)

CA40 **Pneumonia**

A disease of the lungs, frequently but not always caused by an infection with bacteria, virus, fungus, or parasite. This disease is characterised by fever, chills, cough with sputum production, chest pain and shortness of breath. Confirmation is by chest x-ray.

Inclusions: infectious pneumonia

Exclusions: Pneumonitis (CA70-CA7Z)

Coded Elsewhere: Pulmonary toxoplasmosis due to Toxoplasma gondii (1F57.2)

Severe acute respiratory syndrome (1D65)

Congenital pneumonia (KB24)

Abscess of lung with pneumonia (CA43.1)

CA40.0 Bacterial pneumonia

A disease of the pulmonary system, caused by an infection with a bacterial source. This disease is characterised by fever, lethargy, headache, myalgia, vomiting, or coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of the bacterial source in a sputum sample.

Coding Note: Code also the causing condition

Inclusions: bronchopneumonia due to bacteria other than S. pneumoniae and H. influenzae

Exclusions: Congenital pneumonia (KB24)

Legionellosis (1C19)

Coded Elsewhere: Pulmonary actinomycosis (1C10.0)

Pulmonary nocardiosis (1C1B.0)

Pneumonia in Q fever (1C33)

Pulmonary anthrax (1B97)

CA40.00 Pneumonia due to Chlamydophila pneumoniae

A disease of the pulmonary system, caused by an infection with the gram-negative bacteria Chlamydia pneumoniae. This disease commonly presents with a gradual onset of cough with low-grade fever. This disease may also present with pharyngitis, laryngitis, and sinusitis. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Chlamydia pneumoniae in a sputum sample.

Coded Elsewhere: Congenital pneumonia due to Chlamydia (KB24)

CA40.01 Pneumonia due to Escherichia coli

A disease of the pulmonary system, caused by an infection with the gram-negative bacteria Escherichia coli. This disease is characterised by fever, cough, and dyspnoea. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by identification of Escherichia coli in blood, sputum, or pleural fluid samples.

Coded Elsewhere: Congenital pneumonia due to Escherichia coli (KB24)

CA40.02 Pneumonia due to Haemophilus influenzae

A disease of the pulmonary system, caused by an infection with the gram-negative bacteria Haemophilus influenzae. This disease is characterised by cough, shortness of breath, fever, chills, muscle aches, and chest pain. Transmission is by inhalation of infected respiratory secretions or direct contact. Confirmation is by identification of Haemophilus influenzae in blood or other typically sterile body fluid.

Inclusions: Bronchopneumonia due to H. influenzae

Exclusions: Congenital pneumonia (KB24)

CA40.03 Pneumonia due to Klebsiella pneumoniae

A disease of the pulmonary system, caused by an infection with the gram-negative bacteria Klebsiella pneumoniae. This infection common presents with thick, haemorrhagic, mucoid sputum. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Klebsiella pneumoniae in a sputum sample.

CA40.04 Pneumonia due to Mycoplasma pneumoniae

A disease of the pulmonary system, caused by an infection with Mycoplasma pneumoniae. This infection common presents with a non-productive cough, chest pain, or fever. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Mycoplasma pneumoniae in a sputum sample.

CA40.05 Pneumonia due to Pseudomonas aeruginosa

A disease of the pulmonary system, caused by an infection with the gram-negative bacteria Pseudomonas aeruginosa. This disease is characterised by fever, cough, and dyspnoea.

Coded Elsewhere: Congenital pneumonia due to Pseudomonas aeruginosa (KB24)

CA40.06 Pneumonia due to Staphylococcus

A disease of the pulmonary system, caused by an infection with the gram-positive bacteria Staphylococcus aureus. This disease is characterised by fever, cough, dyspnoea, and pulmonary abscesses.

Coded Elsewhere: Congenital pneumonia due to staphylococcus (KB24)

CA40.07 Pneumonia due to Streptococcus pneumoniae

A disease of the pulmonary system, caused by an infection with the gram-positive bacteria Streptococcus pneumoniae. This disease is characterised by an acute onset of fever and chills, or rigors. This disease may also present with chest pain, productive cough, dyspnoea, tachypnoea, hypoxia, or tachycardia. Transmission is by inhalation of infected respiratory secretions, or indirect contact. Confirmation is by identification of Streptococcus pneumoniae in a sputum sample.

Inclusions: Bronchopneumonia due to S. pneumoniae

Exclusions: Pneumonia due to other streptococci (CA40.0)

congenital pneumonia due to S. pneumoniae (KB24)

Pneumonia due to Beta-haemolytic streptococcus (CA40.08)

CA40.08 Pneumonia due to Beta-haemolytic streptococcus

A disease of the lungs, caused by an infection with the gram-positive bacteria Beta Haemolytic streptococcus. This disease is characterised by an acute onset of fever and chills, or rigors. This presents with chest pain, productive cough, dyspnoea, tachypnoea, hypoxia, or tachycardia. Transmission is by inhalation of infected inspiratory secretions, or direct contact.

Inclusions: Pneumonia due to streptococcus, group B

Coded Elsewhere: Congenital pneumonia due to streptococcus, group B (KB24)

CA40.0Y Pneumonia due to other specified bacteria

Coding Note: Code also the causing condition

CA40.0Z Bacterial pneumonia, unspecified

Coding Note: Code also the causing condition

CA40.1 **Viral pneumonia**

A disease of the pulmonary system, caused by an infection with a viral source. This disease is characterised by fever, lethargy, headache, myalgia, vomiting, or coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of the viral source in a sputum sample.

Coding Note: Code also the causing condition

Inclusions: bronchopneumonia due to viruses other than influenza viruses

Exclusions: aspiration pneumonia (CA71.0)

Influenza with pneumonia, virus not identified (1E32)

Severe acute respiratory syndrome (1D65)

lipid pneumonia (CA71.1)

Idiopathic interstitial pneumonitis (CB03)

Aspiration pneumonitis due to anaesthesia during labour or delivery (JB0C.0)

Pulmonary complications of anaesthesia during pregnancy (JA67.0)

Congenital pneumonia (KB24)

Pneumonitis due to solids and liquids (CA71)

Pulmonary complications of anaesthesia during the puerperium (JB43.0)

CA40.10 Pneumonia due to Adenovirus

A disease of the pulmonary system, caused by an infection with adenovirus. This disease is characterised by fever, chills, or rigors. This disease may also present with chest pain, productive cough, dyspnoea, tachypnoea, hypoxia, and tachycardia. Transmission is by droplet transmission. Confirmation is by identification of adenovirus in a sputum sample.

CA40.11 Pneumonia due to Respiratory syncytial virus

A disease caused by an infection with respiratory syncytial virus. This disease is characterised by an inflammatory condition of the lung commonly affecting the alveoli (pneumonia), leading to coughing, sneezing, fever, or wheezing. This disease may be severe in premature babies and those with concurrent disease or immunosuppression. Transmission is by direct contact, droplet transmission, or indirect contact with infected respiratory secretions. Confirmation is by identification of respiratory syncytial virus, commonly through antigen detection or cell culture.

CA40.12 Pneumonia due to parainfluenza virus

A disease of the pulmonary system, caused by an infection with parainfluenza virus. This disease is characterised by fever, malaise, cough, or tachypnoea. Transmission is by inhalation of infected respiratory secretions, direct contact, or through fomites. Confirmation is by identification of the parainfluenza virus in respiratory secretions, detection of a significant rise in parainfluenza specific IgG antibodies in paired serum, or detection of parainfluenza specific IgM antibodies in a single serum sample.

CA40.13 Pneumonia due to Human metapneumovirus

A disease of the pulmonary system, caused by an infection with Human metapneumovirus. This disease is characterised by fever, myalgia, rhinorrhoea, dyspnoea, tachypnoea, or wheezing. This disease also present with symptoms of pneumonia. Transmission is by direct or indirect contact, inhalation of infected respiratory sections, or through fomites. Confirmation is by identification of Human metapneumovirus in a nasopharyngeal, nose, or throat swab or blood sample.

CA40.1Y Pneumonia due to other specified virus

Coding Note: Code also the causing condition

CA40.1Z Viral pneumonia, unspecified

Coding Note: Code also the causing condition

CA40.2 **Fungal pneumonia**

Coding Note: Code also the causing condition

Coded Elsewhere: Pulmonary adiaspiromycosis (1F2L.1)

Pulmonary candidosis (1F23.31)

Pulmonary cryptococcosis (1F27.0)

Chronic pulmonary aspergillosis (1F20.12)

Disseminated histoplasmosis capsulati (1F2A.Y)

Early-onset pneumonia due to Candida (1F23.31)

CA40.20 Pneumonia due to pneumocystis

A disease of the pulmonary system, caused by an infection with the fungi Pneumocystis jirovecii. This disease is characterised by fever, dry cough, shortness of breath, or fatigue. Transmission is by opportunistic infection. Confirmation is by identification of Pneumocystis jirovecii in a lung fluid or tissue sample.

CA40.2Y Other specified fungal pneumonia

Coding Note: Code also the causing condition

CA40.2Z Fungal pneumonia, unspecified

Coding Note: Code also the causing condition

CA40.Y **Other specified pneumonia**

CA40.Z **Pneumonia, organism unspecified**

CA41 Acute bronchiolitis

An acute disease of the bronchioles, commonly caused by an infection with a bacteria or viral source. This disease is characterised by inflammation of the bronchioles and coryza. This disease presents with cough, wheezing, tachypnoea, fever, or chest retraction. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of the infectious agent in a sputum or blood sample.

CA41.0 **Acute bronchiolitis due to respiratory syncytial virus**

A disease of the bronchioles, caused by an infection with respiratory syncytial virus. This disease is characterised by inflammation of the bronchioles. This disease may present with cough, wheezing, or shortness of breath. Transmission is by direct contact, droplet transmission, or indirect contact with infected respiratory secretions. Confirmation is by identification of respiratory syncytial virus from nasopharyngeal swabs.

CA41.Y **Other specified acute bronchiolitis**

CA41.Z **Acute bronchiolitis, unspecified**

CA42 Acute bronchitis

An acute disease of the bronchi, commonly caused by an infection with a bacterial or viral source. This disease is characterised by inflammation of the bronchi. This disease presents with cough, wheezing, chest pain or discomfort, fever, or dyspnoea. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of the infectious agent in a sputum sample.

Exclusions: tracheobronchitis: chronic obstructive (CA22)

tracheobronchitis: chronic (CA22)

Tracheobronchitis, NOS (CA27)

bronchitis, chronic: obstructive (CA22.1)

Simple chronic bronchitis (CA20.10)

Chronic bronchitis, NOS (CA20.1)

Mucopurulent chronic bronchitis (CA20.11)

CA42.0 **Acute bronchitis due to Streptococcus**

A disease of the bronchi, caused by an infection with the gram-positive bacteria Streptococcus. This disease is characterised by inflammation of the bronchi leading to cough, sputum production, or shortness of breath and wheezing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of Streptococcus in a sputum sample.

CA42.1 **Acute bronchitis due to Rhinovirus**

A disease of the pulmonary system, caused by an infection with rhinovirus. This disease is characterised by cough, with or without production of sputum. Transmission is by inhalation of infected respiratory secretions, or direct contact.

CA42.2 **Acute bronchitis due to Respiratory syncytial virus**

Rapid onset inflammation of the large airways in the lung, including any part of the bronchi due to infection with respiratory syncytial virus.

CA42.3 **Acute bronchitis due to Parainfluenza virus**

A disease of the bronchi, caused by an acute infection with parainfluenza virus. This disease is characterised by acute inflammation of the bronchi leading to cough, sputum production, wheezing, or shortness of breath. Transmission is by inhalation of infected respiratory secretions, direct contact, or through fomites. Confirmation is by identification of the parainfluenza virus in respiratory secretions, detection of a significant rise in parainfluenza specific IgG antibodies in paired serum, or detection of parainfluenza specific IgM antibodies in a single serum sample.

CA42.4 **Acute bronchitis due to Haemophilus influenzae**

A disease of the bronchi, caused by an infection with the gram-negative bacteria Haemophilus influenzae. This disease is characterised by acute inflammation of the bronchi leading to cough, sputum production, wheezing or shortness of breath. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by identification of Haemophilus influenzae in blood or other typically sterile body fluid.

CA42.5 **Acute bronchitis due to Coxsackievirus**

A disease of the pulmonary system, caused by an infection with Coxsackie virus. This disease is characterised by cough, fever, or tachypnoea. Transmission is by the faecal-oral route, or vertical transmission. Confirmation is by identification of coxsackievirus in upper respiratory secretion samples.

CA42.Y **Other specified acute bronchitis**

CA42.Z **Acute bronchitis, unspecified**

CA43 Abscess of lung or mediastinum

Coded Elsewhere: Amoebic lung abscess (1A36.11)

CA43.0 **Gangrene or necrosis of lung**

The term "necrotizing pneumonia" or "lung gangrene" is used to distinguish pulmonary necrosis with multiple small abscesses from a larger cavitary lesion (lung abscess).

CA43.1 **Abscess of lung with pneumonia**

CA43.2 **Abscess of lung without pneumonia**

CA43.3 **Abscess of mediastinum**

CA43.Y **Other specified abscess of lung or mediastinum**

CA43.Z **Abscess of lung or mediastinum, unspecified**

CA44 **Pyothorax**

Suppurative inflammation of the pleural space, typically due to acute bacterial infection. It can occur as a complication of pneumonia, thoracotomy, abscesses (lung, hepatic, or subdiaphragmatic), or penetrating trauma with a secondary infection.

Inclusions: empyema

pyopneumothorax

Exclusions: due to tuberculosis (1B10)

CA45 **Respiratory infections, not elsewhere classified**

Exclusions: Upper respiratory tract disorders (CA00-CA0Z)

Chronic obstructive pulmonary disease (CA22)

Certain lower respiratory tract diseases (CA20-CA2Z)

CA4Y **Other specified lung infections**

CA4Z **Lung infections, unspecified**

Lung diseases due to external agents (CA60-CA8Z)

Exclusions: Asthma (CA23)

CA60 **Pneumoconiosis**

Pneumoconiosis is a lung disease due to inhalation of minute particles and characterised pathologically by interstitial fibrosis. The different types of pneumoconiosis vary in relation to the types of inhaled particles, often accompanied by certain occupational environments.

CA60.0 Pneumoconiosis due to dust containing silica

Interstitial lung disease due to inhalation of silica dust. The accumulation of silica/silicates in lung leads to fibrosis and formation of opacities in upper lobes of lungs on chest X-ray

Exclusions: with tuberculosis (1B10-1B1Z)

CA60.00 Pneumoconiosis due to talc dust

CA60.0Y Other specified pneumoconiosis due to dust containing silica

CA60.0Z Pneumoconiosis due to dust containing silica, unspecified

CA60.1 Coal worker pneumoconiosis

Coalworker pneumoconiosis, an interstitial lung disease due to inhalation of coal dust. The accumulation of coal in the lung leads to fibrosis and formation of coal macules which are seen on chest X-ray as opacities and fibrosis

Inclusions: Black lung

Anthracosis

Anthracosilicosis

Coalworker lung

Exclusions: with tuberculosis (1B10-1B1Z)

CA60.2 Pneumoconiosis due to mineral fibres including asbestos

Asbestosis is pneumoconiosis, an interstitial lung disease due to inhalation of asbestos fibres. The accumulation of fibres in the lung leads to diffuse fibrosis and formation of opacities in lower parts of lungs on chest X-ray. Asbestos bodies may be detected in lungs and sputum

Inclusions: Asbestosis

Exclusions: Pleural plaque with presence of asbestos (CB20)

with tuberculosis (1B10-1B1Z)

CA60.3 Pneumoconiosis associated with tuberculosis

This is an occupational lung disease and a restrictive lung disease caused by the inhalation of dust, often in mines, associated with a common, and in many cases lethal, infectious disease caused by various strains of mycobacteria, usually Mycobacterium tuberculosis.

CA60.4 Aluminosis of lung

Aluminosis is a lung disease caused by the inhalation of dusts of certain aluminium compounds

CA60.5 Bauxite fibrosis of lung

CA60.6 Berylliosis

Chronic beryllium disease also known as berylliosis is an occupational hypersensitivity disorder caused by beryllium exposure at the workplace. It is characterised by non-caseating, non-necrotising granulomata within affected organs, most frequently lung and skin.

Coded Elsewhere: Hepatic berylliosis (DB97.1)

CA60.7 Graphite fibrosis of lung

Graphite fibrosis of lung is the pulmonary damage caused by excessive inhalation of graphite.

CA60.8 Siderosis

Siderosis refers to pneumoconiosis resulting from inhalation of iron from welding fumes or from iron or hematite mine dust.

CA60.9 **Stannosis**

Stannosis is a benign non-fibrotic pneumoconiosis caused by exposure to tin oxides including stannous oxide (SnO) and stannic oxide (SnO2).

CA60.Y **Other specified pneumoconiosis**

CA60.Z **Pneumoconiosis, unspecified**

Pneumonitis (CA70-CA7Z)

Pneumonitis is a general term that refers to inflammation of lung tissue. Pneumonitis includes the non-infectious lung diseases that cause inflammation of the interstitium of the lung tissue mainly.

Exclusions: Pneumonia (CA40)

Coded Elsewhere: Chronic pneumonitis of infancy (CB04.6)

Aspiration pneumonitis due to anaesthesia during labour or delivery (JB0C.0)

CA70 **Hypersensitivity pneumonitis due to organic dust**

Hypersensitivity pneumonitis due to organic dust is an inflammation of the alveoli, terminal bronchioli and the interstitium within caused by hypersensitivity to inhaled organic dusts, such as allergens derived from fungal, bacterial, animal protein.

Coding Note: Includes: allergic alveolitis and pneumonitis due to inhaled organic dust and particles of fungal, actinomycetic or other origin

Exclusions: pneumonitis due to inhalation of chemicals, gases, fumes or vapours (CA81.0)

CA70.0 **Farmer lung**

Farmer's lung disease is a hypersensitivity pneumonitis, caused by inhalation of organic dust containing spores of microorganisms, often thermophilic actinomycetes and less commonly Saccharopolyspora rectivirgula, living in mouldy hay, straw, or grain. Typical symptoms include dyspnoea, cough, tiredness, headaches and occasional fever/night sweats, with acute, sub-acute or chronic clinical course and can result in chronic disability with granulomatous disease.

CA70.1 **Bagassosis**

Bagassosis is hypersensitivity pneumonitis due to inhalation of dust from bagasse (the residue of cane after extraction of sugar).

CA70.2 **Bird fancier lung**

Bird fancier lung, also called Pigeon-breeder's lung disease, is an allergic alveolitis caused by inhalation of particulate avian emanations, sometimes specified by avian species. Presentation can be acute with chills, cough, fever, shortness of breath, chest tightness usually resolving within 24h after cessation of antigen exposure, sub-acute with cough and dyspnoea over several days to weeks, whereas chronic form results in breathlessness, coughing, lack of appetite and weight loss.

CA70.3 **Suberosis**

Suberosis also known as Corkhandler disease or Corkworker lung is a type of hypersensitivity pneumonitis usually caused by the fungus Penicillium glabrum (formerly called Penicillum frequentans) from exposure to moldy cork dust. Chrysonilia sitophilia, Aspergillus fumigatus, uncontaminated cork dust, and Mucor macedo may also have significant roles in the pathogenesis of the disease.

CA70.4 **Malt worker lung**

A disease of the pulmonary system, caused by the fungi Aspergillus clavatus or Aspergillus fumigatus. This disease commonly presents with fever, chills, fatigue, weight loss, cough, headache, myalgia, or shortness of breath. Transmission is by inhalation of fungal spores. Confirmation is by identification of Aspergillus in a sputum, blood, or skin sample.

Inclusions: Alveolitis due to Aspergillus clavatus

CA70.5 **Mushroom worker lung**

Mushroom-worker's lung is occupational hypersensitivity pneumonitis due to mushroom spores and moldy compost.

CA70.6 **Maple bark stripper lung**

Maple-bark-stripper's lung is occupational hypersensitivity pneumonitis due to moldy maple bark containing Cryptostroma corticale.

Inclusions: Alveolitis due to Cryptostroma corticale

Cryptostromosis

CA70.7 **Air conditioner or humidifier lung**

A form of the sick building syndrome caused by organisms that contaminate humidifiers and the piping of air conditioner ducts. The air conditioner blows cold air containing spores of the organisms throughout the building.

CA70.Y **Other specified hypersensitivity pneumonitis due to organic dust**

Coding Note: Includes: allergic alveolitis and pneumonitis due to inhaled organic dust and particles of fungal, actinomycetic or other origin

CA70.Z **Hypersensitivity pneumonitis due to organic dust, unspecified**

Coding Note: Includes: allergic alveolitis and pneumonitis due to inhaled organic dust and particles of fungal, actinomycetic or other origin

CA71 Pneumonitis due to solids and liquids

Exclusions: Neonatal aspiration syndromes (KB26)

CA71.0 **Pneumonitis due to inhalation of food or vomit**

Acute inflammation of the lung parenchyma due to inadvertent passage of ingested solids or liquids into the airway from swallowing dysfunction or after an acute vomiting or gastroesophageal reflux episode.

Exclusions: Mendelson syndrome (CA72)

CA71.1 **Pneumonitis due to oils or essences**

Lipoid pneumonia (pneumonitis) is a rare form of pneumonia (pneumonitis) caused by inhalation or aspiration of fat containing substances like, petroleum jelly, mineral oils, few laxatives etc.

CA71.2 **Pneumonitis due to aspiration of blood**

CA71.3 **Lipoid pneumonitis**

Lipoid pneumonia (pneumonitis) refers to two types lipoid pneumonias (pneumonitises), one is Exogenous lipoid pneumonia (pneumonitis) and another is Endogenous lipoid pneumonia (pneumonitis). Exogenous lipoid pneumonia (pneumonitis) is the accumulation of aspirated oils within the alveoli and subsequent foreign body reaction. Endogenous lipoid pneumonia (pneumonitis), also called cholesterol pneumonia (pneumonitis) or golden pneumonia (pneumonitis), is a localised accumulation of lipid-laden macrophages within alveolar spaces distal to an obstructed airway.

CA71.Y **Other specified pneumonitis due to solids and liquids**

CA71.Z **Pneumonitis due to solids and liquids, unspecified**

CA72 **Mendelson syndrome**

This is chemical pneumonitis caused by aspiration during anaesthesia, especially during pregnancy. Aspiration contents may include gastric juice, blood, bile, water or an association of them.

Exclusions: Complications of anaesthesia during pregnancy (JA67)

Complications of anaesthesia during labour or delivery (JB0C)

Complications of anaesthesia during the puerperium (JB43)

CA7Y **Other specified pneumonitis**

CA7Z **Pneumonitis, unspecified**

CA80 **Airway disease due to specific organic dust**

Airway disease due to specific organic dust includes byssinosis, Flax-dresser disease, cannabinosis, and airway disease due to cotton dust or dusts from other vegetable fibres such as flax, hemp, or sisal or due to other specific organic dusts.

Exclusions: Farmer lung (CA70.0)

reactive airways dysfunction syndrome (CA81)

Hypersensitivity pneumonitis due to organic dust (CA70)

Bagassosis (CA70.1)

CA80.0 **Byssinosis**

Byssinosis (brown lung disease) is a lung disease caused by exposure to dusts from cotton processing, hemp and flax.

Inclusions: Airway disease due to cotton dust

CA80.1 **Flax-dresser disease**

A form of chronic obstructive pulmonary disease caused by inhalation of particles of unprocessed flax; a form of byssinosis.

CA80.2 **Cannabinosis**

Lung disease caused by exposure to dusts from the processing of cotton, hemp, cannabis and flax.

CA80.Y **Other specified airway disease due to specific organic dust**

CA80.Z **Airway disease due to specific organic dust, unspecified**

CA81 Respiratory conditions due to inhalation of chemicals, gases, fumes or vapours

This refers to conditions affecting the organs and tissues that make gas exchange due to inhalation of chemicals, gases, fumes, and vapours.

CA81.0 **Bronchitis or pneumonitis due to chemicals, gases, fumes or vapours**

This is an inflammation of the mucous membranes of the bronchi (the larger and medium-sized airways that carry airflow from the trachea into the more distal parts of the lung parenchyma) and inflammation of lung tissue, due to chemicals, gases, fumes and vapours.

CA81.1 **Pulmonary oedema due to chemicals, gases, fumes or vapours**

CA81.2 **Upper respiratory inflammation due to chemicals, gases, fumes or vapours, not elsewhere classified**

CA81.Y **Other specified respiratory conditions due to inhalation of chemicals, gases, fumes or vapours**

CA81.Z **Respiratory conditions due to inhalation of chemicals, gases, fumes or vapours, unspecified**

CA82 Respiratory conditions due to other external agents

CA82.0 **Acute pulmonary manifestations due to radiation**

An acute inflammatory reaction of the lung in response to repeated or high dose radiation exposure.

CA82.1 **Chronic or other pulmonary manifestations due to radiation**

A chronic inflammatory reaction of the lung ultimately resulting in fibrosis in response to repeated or high dose radiation exposure.

CA82.2 **Acute drug-induced interstitial lung disorders**

An acute inflammatory reaction of the lung in response to drugs.

CA82.3 **Chronic drug-induced interstitial lung disorders**

An chronic inflammatory reaction of the lung ultimately resulting in fibrosis in response to drugs.

CA82.4 **Aspergillus-induced allergic or hypersensitivity conditions**

Coded Elsewhere: Malt worker lung (CA70.4)

Allergic aspergillus rhinosinusitis (CA0A.Y)

CA82.Y **Other specified respiratory conditions due to other external agents**

CA82.Z **Respiratory conditions due to other external agents, unspecified**

CA8Y **Other specified lung diseases due to external agents**

CA8Z **Lung diseases due to external agents, unspecified**

Respiratory diseases principally affecting the lung interstitium (CB00-CB0Z)

Coded Elsewhere: Lipoid pneumonitis (CA71.3)

CB00 **Acute respiratory distress syndrome**

Acute respiratory distress syndrome ("ARDS") is a life-threatening inflammation with oedema in the lungs which leads to severe respiratory failure. ARDS is a clinical syndrome of lung injury with hypoxic respiratory failure caused by intense pulmonary inflammation that develops after a severe physiologic insult.

Coded Elsewhere: Respiratory distress syndrome of newborn (KB23.0)

CB01 **Pulmonary oedema**

Pulmonary oedema is a condition caused by excess fluid in the lungs. This fluid collects in the numerous air sacs in the lungs, making it difficult to breathe.

Exclusions: Pulmonary oedema due to chemicals, gases, fumes or vapours (CA81.1)

Pulmonary oedema with mention of heart disease NOS or heart failure (BD11)

CB02 **Pulmonary eosinophilia**

Pulmonary eosinophilia are a heterogeneous group of disorders that share the feature of abnormally increased numbers of eosinophils.

CB02.0 **Asthmatic pulmonary eosinophilia**

Asthmatic pulmonary eosinophilia is a form of pulmonary eosinophilia associated with asthma which has been commonly attributed to fungi such as Aspergillus species. Although many cases have not shown any allergen.

CB02.1 **Idiopathic eosinophilic pneumonitis**

This is an idiopathic disease in which a certain type of white blood cell called an eosinophil accumulates in the lung. These cells cause disruption of the normal air spaces (alveoli) where oxygen is extracted from the atmosphere.

Inclusions: Idiopathic eosinophilic pneumonia

CB02.10 Idiopathic acute eosinophilic pneumonitis

Idiopathic acute eosinophilic pneumonia (pneumonitis) is characterised by acute febrile respiratory failure associated with diffuse radiographic infiltrates and eosinophilia in bronchoalveolar lavage fluid (BAL) in the absence of infection. Patients, who are initially healthy and often young, present with severe hypoxemia.

Inclusions: Idiopathic acute eosinophilic pneumonia

CB02.11 Idiopathic chronic eosinophilic pneumonitis

Idiopathic chronic eosinophilic pneumonia (pneumonitis) is a pulmonary disease characterised by subacute or chronic respiratory and general symptoms, alveolar and/or blood eosinophilia, and peripheral pulmonary infiltrates on chest imaging and blood eosinophilia in most cases.

Inclusions: Idiopathic chronic eosinophilic pneumonia

CB02.1Y Other specified idiopathic eosinophilic pneumonitis

CB02.1Z Idiopathic eosinophilic pneumonitis, unspecified

CB02.2 Tropical pulmonary eosinophilia

Tropical pulmonary eosinophilia (TPE) is a syndrome of wheezing, fever and eosinophilia seen predominantly in the Indian subcontinent and other tropical areas.[1]

The syndrome has been termed tropical eosinophilia, tropical pulmonary eosinophilia (TPE), or tropical filarial pulmonary eosinophilia (TFPE).Tropical filarial pulmonary eosinophilia (TFPE) is a clinical manifestation of lymphatic filariasis, a parasitic infection caused by filarial nematodes (roundworms) that inhabit the lymphatics and bloodstream.[2]

CB02.Y Other specified pulmonary eosinophilia

CB02.Z Pulmonary eosinophilia, unspecified

CB03 Idiopathic interstitial pneumonitis

The idiopathic interstitial pneumonias (pneumonitises) are a subset of diffuse interstitial lung diseases of unknown etiology characterised by expansion of the interstitial compartment (i.e. that portion of the lung parenchyma sandwiched between the epithelial and endothelial basement membranes) with an infiltrate of inflammatory cells. The inflammatory infiltrate is sometimes accompanied by fibrosis, either in the form of abnormal collagen deposition or proliferation of fibroblasts capable of collagen synthesis.

Inclusions: Idiopathic interstitial pneumonia

CB03.0 Acute interstitial pneumonitis

Acute interstitial pneumonia (pneumonitis), also referred to as Hamman-Rich syndrome, is a rapidly progressive and histologically distinct form of idiopathic interstitial pneumonia (pneumonitis).

CB03.1 **Combined pulmonary fibrosis and emphysema syndrome**

Combined pulmonary fibrosis and emphysema (CPFE) is a syndrome of combined emphysema of the upper lobes and fibrosis of the lower lobes defined on chest computed tomography, and characterised by subnormal spirometry, severe impairment of gas exchange, high prevalence of pulmonary hypertension, and poor survival.

Characteristic functional profile of CPEF is strongly impaired carbon monoxide diffusing capacity of the lung, and hypoxaemia at exercise, with preserved lung volumes. Despite subnormal spirometry, which may be responsible

for its under recognition, CPFE is a severe entity. The presence of pulmonary arterial hypertension at diagnosis is a critical determinant of prognosis.

CB03.2 **Cryptogenic organizing pneumonitis**

Cryptogenic organizing pneumonia (pneumonitis) (COP) or bronchiolitis obliterans with organizing pneumonia (pneumonitis) (BOOP) is an inflammatory, non-infectious lung disease with distinctive clinical, radiological and pathological features, and that responds to corticosteroid therapy.

CB03.3 **Desquamative interstitial pneumonitis**

This is a form of idiopathic interstitial pneumonia (pneumonitis) featuring elevated levels of macrophages.

Inclusions: Desquamative interstitial pneumonia

CB03.4 **Idiopathic pulmonary fibrosis**

Idiopathic pulmonary fibrosis (IPF) is defined as a specific form of chronic, progressive fibrosing interstitial pneumonia (pneumonitis) of unknown cause, occurring primarily in older adults, limited to the lungs, and associated with the histopathologic and/or radiologic pattern of UIP. The definition of IPF requires the exclusion of other forms of interstitial pneumonia (pneumonitis) including other idiopathic interstitial pneumonias (pneumonitis) and Interstitial Lung Disease (ILD) associated with environmental exposure, medication, or systemic disease.

CB03.5 **Lymphoid interstitial pneumonia**

This refer to several conditions in which lymphocytes are produced in excessive quantities. They typically occur in patients who have compromised immune systems. They are sometimes equated with "immunoproliferative disorders", but technically Lymphoproliferative disorders are a subset of immunoproliferative disorders, along with hypergammaglobulinemia and paraproteinaemias.

CB03.6 **Respiratory bronchiolitis - interstitial lung disease**

Respiratory bronchiolitis - interstitial lung disease is a mild inflammatory pulmonary disorder developed by cigarette smokers and characterised by shortness of breath and cough, pulmonary function abnormalities of mixed restrictive and obstructive lung disease and high resolution CT scanning showing centrilobular micronodules, ground glass opacities and peribronchiolar thickening.

CB03.Y **Other specified idiopathic interstitial pneumonitis**

CB03.Z **Idiopathic interstitial pneumonitis, unspecified**

CB04 Primary interstitial lung diseases specific to infancy or childhood

CB04.0 Diffuse pulmonary developmental disorders

CB04.1 Pulmonary lymphatic dysplasia syndromes

Coded Elsewhere: Yellow nail syndrome (EE11.1)

Congenital pulmonary lymphangiectasia (LA75.Y)

CB04.2 Disorders of surfactant metabolism

Primary interstitial lung disease specific to childhood due to pulmonary surfactant protein anomalies is a group of interstitial lung diseases (ILD) induced by genetic mutations disrupting surfactant function and gas exchange in the lung. The disorders caused by these mutations affect full-term infants and older children and exhibit considerable overlap in their clinical and histologic presentation

CB04.3 Alveolar or peri-alveolar conditions

CB04.30 Idiopathic pulmonary haemosiderosis

Idiopathic pulmonary hemosiderosis is a respiratory disease due to repeated episodes of diffuse alveolar haemorrhage without any underlying apparent cause, most often in children. anaemia, cough, and pulmonary infiltrates on chest radiographs are found in majority of the patients.

CB04.31 Pulmonary alveolar proteinosis

This is a rare lung disease in which abnormal accumulation of surfactant occurs within the alveoli, interfering with gas exchange. PAP can occur in a primary form or secondarily in the settings of malignancy (especially in myeloid leukemia), pulmonary infection, or environmental exposure to dusts or chemicals.

CB04.3Y Other specified alveolar or peri-alveolar conditions

CB04.3Z Alveolar or peri-alveolar conditions, unspecified

CB04.4 Pulmonary capillaritis

Isolated pauciimmune pulmonary capillaritis is a small vessel vasculitis restricted to the lungs that may induce diffuse alveolar haemorrhage with dyspnoea, anaemia, chest pain, haemoptysis, bilateral and diffuse alveolar infiltrates at chest X-rays, without any underlying systemic disease. ANCA are frequently positive but could be negative.

CB04.5 Brain-lung-thyroid syndrome

Brain-lung-thyroid syndrome is a rare disorder characterised by congenital hypothyroidism, infant respiratory distress syndrome (IRDS) and benign hereditary chorea.

CB04.6 **Chronic pneumonitis of infancy**

Chronic pneumonitis of infancy is a rare paediatric form of interstitial lung disease (ILD) sharing clinical and radiologic features with other forms of ILD (cough, tachypnoea, and infiltrative opacities on chest imaging) and harbouring specific histological abnormalities including diffuse thickening of alveolar septa, hyperplasia of type 2 alveolar epithelial cells (AEC), and presence of primitive mesenchymal cells within the alveolar septa.

CB04.7 **Neuroendocrine cell hyperplasia of infancy**

Neuroendocrine cell hyperplasia of infancy is a non-lethal paediatric form of interstitial lung disease (ILD) characterised by tachypnoea and respiratory distress without respiratory failure.

CB04.Y **Other specified primary interstitial lung diseases specific to infancy or childhood**

CB04.Z **Primary interstitial lung diseases specific to infancy or childhood, unspecified**

CB05 Interstitial lung diseases associated with systemic diseases

This refers to a group of lung diseases affecting the interstitium (the tissue and space around the air sacs of the lungs). This diagnosis is associated with diseases that affect a number of organs and tissues, or affects the body as a whole.

Coding Note: Code also the causing condition

CB05.0 **Diffuse alveolar damage**

This is a histological pattern in lung disease. It is seen in acute respiratory distress syndrome (ARDS), transfusion related acute lung injury (TRALI) and acute interstitial pneumonia (pneumonitis) (AIP).

CB05.1 **Interstitial lung diseases associated with connective tissue diseases**

Interstitial lung diseases associated with connective tissue diseases refers to a group of lung diseases affecting the interstitium (the tissue and space around the air sacs of the lungs) associated with connective tissue diseases.

Coding Note: Code also the causing condition

Coded Elsewhere: Respiratory disorders in juvenile dermatomyositis (CB40.Y)

Respiratory disorders in other dermatomyositis (CB40.Y)

Respiratory disorders in polymyositis (CB40.Y)

Respiratory disorders in Sjögren syndrome (CB40.Y)

Respiratory disorders in systemic lupus erythematosus (CB40.Y)

Respiratory disorders in systemic sclerosis (CB40.Y)

CB05.2 **Interstitial lung diseases associated with granulomatous diseases**

Interstitial lung diseases associated with granulomatous diseases refers to a group of lung diseases affecting the interstitium (the tissue and space around the air sacs of the lungs) associated with granulomatous diseases, such as sarcoidosis.

Coded Elsewhere: Sarcoidosis of lung (4B20.0)

Sarcoidosis of lung with sarcoidosis of lymph nodes (4B20.Y)

CB05.3 **Interstitial lung diseases associated with metabolic diseases**

Interstitial lung diseases associated with metabolic diseases refers to a group of lung diseases affecting the interstitium (the tissue and space around the air sacs of the lungs). This diagnosis is associated with a large class of genetic diseases involving disorders of metabolism.

Coding Note: Code also the causing condition

Coded Elsewhere: Familial hypocalciuric hypercalcaemia (5A51.2)

Hermansky-Pudlak syndrome with pulmonary fibrosis (EC23.20)

CB05.4 **Interstitial lung diseases associated with systemic vasculitides**

Interstitial lung diseases associated with systemic vasculitides refers to a group of lung diseases affecting the interstitium (the tissue and space around the air sacs of the lungs). This diagnosis is associated with a type of small vessel vasculitis.

Coded Elsewhere: Respiratory disorders in Wegener's granulomatosis (CB40.Y)

CB05.40 Respiratory disorders in Churg-Strauss syndrome

This encompasses pathological conditions affecting the organs and tissues that make gas exchange possible in higher organisms, and includes conditions of the upper respiratory tract, trachea, bronchi, bronchioles, alveoli, pleura and pleural cavity, and the nerves and muscles of breathing. This diagnosis is in a medium and small vessel autoimmune vasculitis, leading to necrosis.

CB05.41 Respiratory disorders in microscopic polyangiitis

This encompasses pathological conditions affecting the organs and tissues that make gas exchange possible in higher organisms, and includes conditions of the upper respiratory tract, trachea, bronchi, bronchioles, alveoli, pleura and pleural cavity, and the nerves and muscles of breathing. This diagnosis is in an ill-defined autoimmune disease characterised by a systemic, pauci-immune, necrotizing, small-vessel vasculitis without clinical or pathological evidence of necrotizing granulomatous inflammation.

CB05.4Y Other specified interstitial lung diseases associated with systemic vasculitides

CB05.4Z Interstitial lung diseases associated with systemic vasculitides, unspecified

CB05.5 **Secondary pulmonary haemosiderosis**

Secondary pulmonary hemosiderosis is a respiratory disease due to the deposition of hemosiderin-laden macrophages in lungs as a result of repeated alveolar haemorrhage secondary to another disease, especially dysimmunitary disorders (i.e. Heiner syndrome, autoimmune diseases), thrombotic disorders and cardiovascular disorders such as mitral stenosis. It manifests as a triad of haemoptysis, anaemia and diffuse parenchymal infiltrates on chest radiography

Coding Note: Code also the causing condition

CB05.Y **Other specified interstitial lung diseases associated with systemic diseases**

Coding Note: Code also the causing condition

CB05.Z **Interstitial lung diseases associated with systemic diseases, unspecified**

Coding Note: Code also the causing condition

CB06 **Pulmonary alveolar microlithiasis**

Pulmonary alveolar microlithiasis is an idiopathic rare disease in which concretions composed of calcium and phosphorus collect in alveolar spaces. A systemic disorder of calcium metabolism has not been identified, and the serum calcium and phosphate levels are normal. Cough and dyspnoea are the most common presenting symptoms. Expectorated microliths have been reported. Inspiratory crackles, finger clubbing, and signs of cor pulmonale may be present in more advanced disease.

CB07 **Lymphangioleiomyomatosis**

Lymphangioleiomyomatosis (LAM) is a multiple cystic lung disease characterised by progressive cystic destruction of the lung and lymphatic abnormalities, frequently associated with renal angiomyolipomas (AMLs). LAM occurs either sporadically or as a manifestation of tuberous sclerosis complex (TSC,).

CB07.0 Lymphangioleiomyomatosis associated with tuberous sclerosis complex

This is a rare lung disease that results in a proliferation of disorderly smooth muscle growth (leiomyoma) throughout the lungs, in the bronchioles, alveolar septa, perivascular spaces, and lymphatics, resulting in the obstruction of small airways (leading to pulmonary cyst formation and pneumothorax) and lymphatics (leading to chylous pleural effusion). This diagnosis is associated with a rare multi-system genetic disease that causes non-malignant tumours to grow in the brain and on other vital organs such as the kidneys, heart, eyes, lungs, and skin.

CB07.1 Sporadic lymphangioleiomyomatosis

This is a rare lung disease that results in a proliferation of disorderly smooth muscle growth (leiomyoma) throughout the lungs, in the bronchioles, alveolar septa, perivascular spaces, and lymphatics, resulting in the obstruction of small airways (leading to pulmonary cyst formation and pneumothorax) and lymphatics (leading to chylous pleural effusion). LAM occurs in a sporadic form, which affects only females, usually of childbearing age; LAM also occurs in patients who have tuberous sclerosis.

CB07.Y Other specified lymphangioleiomyomatosis

CB07.Z Lymphangioleiomyomatosis, unspecified

CB0Y **Other specified respiratory diseases principally affecting the lung interstitium**

CB0Z **Respiratory diseases principally affecting the lung interstitium, unspecified**

Pleural, diaphragm or mediastinal disorders (CB20-CB2Z)

Pleural, diaphragm and mediastinal disorders are disorders of the potential space between the two pleura (visceral and parietal) of the lungs, disorders of the diaphragm and mediastinum. The mediastinum is an undelineated group of structures in the thorax, surrounded by loose connective tissue. It is the central compartment of the thoracic cavity.

CB20 Pleural plaque

Deposits of hyalinized collagen fibres in the parietal pleura that result from chronic inflammation. Most commonly associated with past exposure to asbestos, typically becoming visible years after inhalation of the inciting exposure.

CB21 Pneumothorax

Pneumothorax is an abnormal collection of air or gas in the pleural space that separates the lung from the chest wall, and that may interfere with normal breathing.

Exclusions: pyopneumothorax (CA44)

pneumothorax: tuberculous (not confirmed) (1B10.1)

Traumatic pneumothorax (NB32.0)

pneumothorax: tuberculous (confirmed) (1B10.0)

Coded Elsewhere: Pneumothorax originating in the perinatal period (KB27.1)

CB21.0 Spontaneous tension pneumothorax

A tension pneumothorax is present when the intrapleural pressure is greater than atmospheric throughout expiration and often during inspiration as well. The mechanism responsible for tension pneumothorax is the disruption of the visceral or parietal pleura in such a manner that a one-way valve develops. A tension pneumothorax can occur after any type of pneumothorax; it is independent of the etiology. It can sometimes occur after a spontaneous pneumothorax but is more common after a traumatic pneumothorax, with mechanical ventilation, or during cardiopulmonary resuscitation.

CB21.1 **Other spontaneous pneumothorax**

Spontaneous pneumothorax that is not tension pneumothorax is included in this classification

They include primary spontaneous pneumothorax without tension and secondary spontaneous pneumothorax without tension. Primary spontaneous pneumothorax occurs in patients without underlying pulmonary disease, classically in tall, thin young men in their teens and 20s. It is thought to be due to spontaneous rupture of subpleural apical blebs or bullae that result from smoking or that are inherited. It generally occurs at rest, although some cases occur during activities involving reaching or stretching. Primary spontaneous pneumothorax also occurs during diving and high-altitude flying because of unequally transmitted pressure changes in the lung. Secondary spontaneous pneumothorax occurs in patients with underlying pulmonary disease. It most often results from rupture of a bleb or bulla in patients with severe COPD, HIV-related Pneumocystis jirovecii infection, cystic fibrosis, or any underlying pulmonary parenchymal disease Secondary spontaneous pneumothorax is more serious than primary spontaneous pneumothorax because it occurs in patients whose underlying lung disease decreases their pulmonary reserve.

CB21.Y **Other specified pneumothorax**

CB21.Z **Pneumothorax, unspecified**

CB22 Diseases of mediastinum, not elsewhere classified

This refers to diseases of the mediastinum where the mediastinum is an undelineated group of structures in the thorax, surrounded by loose connective tissue. It is the central compartment of the thoracic cavity

Exclusions: Abscess of mediastinum (CA43.3)

CB22.0 **Fibrosing mediastinitis**

Fibrosing mediastinitis, also known as sclerosing mediastinitis or mediastinal fibrosis, is a disorder characterised by an excessive fibrotic reaction in the mediastinum. It can result in compromise of airways, great vessels, and other mediastinal structures, with morbidity directly related to the location and extent of fibrosis. The commonest cause is histoplasmosis, of which it is a rare late complication, but it may also occur in association with other infections and with systemic autoimmune disorders such as Behçet disease, granulomatosis with polyangiitis and retroperitoneal fibrosis.

CB22.Y **Other specified diseases of mediastinum, not elsewhere classified**

CB22.Z **Diseases of mediastinum, not elsewhere classified, unspecified**

CB23 Disorders of diaphragm

This category includes the abnormalities of diaphragmatic position or motion (paralysis, relaxation, and acquired deformity) and the inflammation of the diaphragm, but neoplasms of the diaphragm, congenital malformation of diaphragm, and diaphragmatic hernias are included in other categories.

Exclusions: Congenital diaphragmatic hernia (LB00.0)

Structural developmental anomalies of diaphragm (LB00)

CB24 **Chylous effusion**

A chylothorax (chylous effusion) signifies leakage of chyle from the thoracic duct. A pleural fluid triglyceride concentration of more than 110 mg per decilitre signifies a high likelihood of chylothorax, whereas a triglyceride concentration below 50 mg per decilitre makes chylothorax highly unlikely.

Inclusions: Chyliform effusion

CB25 **Fibrothorax**

Fibrothorax results from fibrosis of the visceral pleura, and is clinically manifested by decreased respiratory excursion and restrictive pulmonary physiology. There are two distinct mechanisms that can lead to the formation of fibrothorax: 1) Most often, fibrothorax develops as a consequence of pleural inflammation in patients with pleural effusions, including hemothorax, tuberculous effusion, or chronic empyema; 2) Less frequently, fibrothorax results from pulmonary parenchymal disease, and can be seen in patients with tuberculosis, bronchiectasis, or lung abscess.

CB26 **Haemothorax**

Hemothorax is the presence of blood with or without air in the pleural space. The most common cause is chest trauma. Hemothorax should be considered to be present when the haematocrit of the pleural fluid is more than half that of the peripheral blood. A number of bleeding sites may be responsible for the hemothorax, including pulmonary laceration, intercostal vessel laceration, and rupture of pleural adhesions.

CB27 **Pleural effusion**

Presence of fluid in the pleural cavity resulting from excessive transudation or exudation from the pleural surfaces.

Coding Note: Code also the causing condition

Inclusions: Pleurisy with effusion

Exclusions: Tuberculosis of the respiratory system (1B10)

Chylous effusion (CB24)

Pleurisy (MD31)

CB2Y **Other specified pleural, diaphragm or mediastinal disorders**

CB2Z **Pleural, diaphragm or mediastinal disorders, unspecified**

CB40 **Certain diseases of the respiratory system**

Coding Note: Code also the causing condition

Coded Elsewhere: Pulmonary sporotrichosis (1F2J.2)

Alpha-1-antitrypsin deficiency (5C5A)

Airway obstruction in the neonate due to airway abnormality (KB2J)

CB40.0 **Ciliary dyskinesia**

Defective function of the cilia lining the respiratory tract (lower and upper, sinuses, Eustachian tube, middle ear) resulting in altered mucociliary transport and manifesting as recurrent upper and lower respiratory infection, chronic productive cough, chronic rhinosinusitis or persistent otitis media. Acquired forms result from respiratory tract injury associated especially with respiratory infections such as bronchiolitis or chronic obstructive pulmonary disease. The rare primary forms are inherited as autosomal recessive disorders presenting early in life and typically progressing to bronchiectasis; they may be associated with infertility in men and women due to abnormal sperm motility or fallopian tube function respectively.

Coded Elsewhere: Primary ciliary dyskinesia (LA75.Y)

Syndromic ciliary dyskinesia (LA75.Y)

CB40.1 **Young syndrome**

Young syndrome is characterised by the association of obstructive azoospermia with recurrent sinobronchial infections.

CB40.2 **Pulmonary collapse**

Inclusions: Atelectasis

Exclusions: Primary atelectasis of newborn (KB2B)

atelectasis (of): tuberculous (not confirmed) (1B10.1)

atelectasis (of): tuberculous (confirmed) (1B10.0)

CB40.3 **Interstitial emphysema**

This is a collection of air outside of the normal air passages in the body and instead is found inside the connective tissue of the peribronchovascular sheaths, interlobular septa, and visceral pleura. This collection develops as a result of alveolar and terminal bronchiolar rupture.

Exclusions: emphysema: NOS (CA21)

emphysema: surgical (subcutaneous) (NE81)

Traumatic subcutaneous emphysema, not elsewhere classified (NF0A.7)

Coded Elsewhere: Pneumomediastinum originating in the perinatal period (KB27.2)

Interstitial emphysema originating in the perinatal period (KB27.0)

CB40.4 **Compensatory emphysema**

Compensatory emphysema is a condition in which one portion of the lung increases in size and function, when another portion is destroyed or temporarily useless. It occurs, for instance, in association with pneumonias, pleural effusions and pneumothorax. Anatomically, there is found an enlargement of the normal lung; there are no variations from the normal structure; the unaffected lung, as a result of distention, has an increased vital capacity and is able to perform a greater amount of work than when in its usual condition. The tissues show no similarity to those truly emphysematous. This change is in no way related to true emphysema and the term should not be used, as it creates great confusion in the literature. Its use is no more justified than that of speaking of the compensatory enlargement of a kidney, when the opposite kidney has been removed, as of a compensatory nephritis. True emphysema can never compensate for diseased lung tissue, because the emphysematous lung is totally or almost totally functionless.

CB40.Y **Other specified diseases of the respiratory system**

Coding Note: Code also the causing condition

CB41 Respiratory failure

Respiratory failure is a life-threatening impairment of oxygenation or CO2 elimination. Respiratory failure may occur because of impaired gas exchange, decreased ventilation, or both. The level of oxygen in the blood becomes dangerously low or the level of carbon dioxide becomes dangerously high.

Coding Note: Code also the causing condition

Exclusions: Acute respiratory distress syndrome (CB00)

Respiratory arrest (MD33)

Respiratory distress of newborn (KB23)

CB41.0 **Acute respiratory failure**

Respiratory failure can be acute (short term) or chronic (ongoing), using time as the main parameter. In acute respiratory failure hypoxemia occurs over a period of hours to days (less than 7 days), and acute respiratory failure can develop quickly and may require emergency treatment.

Coding Note: Code also the causing condition

CB41.00 Acute respiratory failure, Type I

When acute respiratory failure causes a low level of oxygen in the blood without a high level of carbon dioxide, it's called hypoxemic acute respiratory failure.

Coding Note: Code also the causing condition

CB41.01 Acute respiratory failure, Type II

When acute respiratory failure causes a high level of carbon dioxide in the blood, it's called hypercapnic acute respiratory failure.

Coding Note: Code also the causing condition

CB41.0Z Acute respiratory failure, unspecified

Coding Note: Code also the causing condition

CB41.1 **Chronic respiratory failure**

In chronic respiratory failure hypoxemia occurs over a period of weeks to months (more than seven days), and chronic respiratory failure develops more slowly and lasts longer than acute respiratory failure.

Coding Note: Code also the causing condition

CB41.10 Chronic respiratory failure, Type I

When chronic respiratory failure causes a low level of oxygen in the blood without a high level of carbon dioxide, it's called hypoxemic chronic respiratory failure.

CB41.11 Chronic respiratory failure, Type II

When chronic respiratory failure causes a high level of carbon dioxide in the blood, it's called hypercapnic chronic respiratory failure.

CB41.1Z Chronic respiratory failure, unspecified

Coding Note: Code also the causing condition

CB41.2 **Respiratory failure, unspecified as acute or chronic**

This is inadequate gas exchange by the respiratory system, with the result that levels of arterial oxygen, carbon dioxide or both cannot be maintained within their normal ranges, unspecified.

Coding Note: Code also the causing condition

CB41.20 Respiratory failure, unspecified, Type I

This is when the PaCO2 may be normal or low. It is typically caused by a ventilation/perfusion (V/Q) mismatch; the volume of air flowing in and out of the lungs is not matched with the flow of blood to the lungs. The basic defect in type 1 respiratory failure is failure of oxygenation

CB41.21 Respiratory failure, unspecified, Type II

Type 2 respiratory failure is caused by inadequate ventilation; both oxygen and carbon dioxide are affected. Defined as the build up of carbon dioxide levels (PaCO2) that has been generated by the body.

CB41.2Z Respiratory failure, unspecified

Coding Note: Code also the causing condition

Postprocedural disorders of the respiratory system (CB60-CB64)

Exclusions: Acute pulmonary manifestations due to radiation (CA82.0)

Coded Elsewhere: Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

CB60 **Tracheostomy malfunction**

CB61 **Chronic pulmonary insufficiency following surgery**

CB62 **Postprocedural subglottic stenosis**

CB63 **Postprocedural stenosis of the trachea**

CB64 **Transfusion related acute lung injury**

This is a serious blood transfusion complication characterised by the acute onset of non-cardiogenic pulmonary oedema following transfusion of blood products.

CB7Z **Diseases of the respiratory system, unspecified**

CHAPTER 13

Diseases of the digestive system

This chapter has 156 four-character categories.

Code range starts with DA00

Exclusions: Endocrine, nutritional or metabolic diseases (Chapter 05)

Injury, poisoning or certain other consequences of external causes (Chapter 22)

Neoplasms (Chapter 02)

Certain infectious or parasitic diseases (Chapter 01)

Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Mental, behavioural or neurodevelopmental disorders (Chapter 06)

Coded Elsewhere: Digestive system disorders of fetus or newborn (KB80-KB8Z)

Symptoms, signs or clinical findings of the digestive system or abdomen (MD80-ME4Y)

Structural developmental anomalies of the digestive tract (LB10-LB1Z)

Diseases of the digestive system complicating pregnancy, childbirth or the puerperium (JB64.6)

This chapter contains the following top level blocks:

- Diseases or disorders of orofacial complex
- Diseases of oesophagus
- Diseases of the stomach or the duodenum
- Diseases of small intestine
- Diseases of appendix
- Diseases of large intestine
- Diseases of anal canal
- Diseases of liver
- Diseases of gallbladder or biliary tract
- Diseases of pancreas
- Diseases of peritoneum
- Diverticular disease of intestine
- Ischaemic vascular disorders of intestine
- Hernias
- Inflammatory bowel diseases
- Functional gastrointestinal disorders

- Postprocedural disorders of digestive system

Diseases or disorders of orofacial complex (DA00-DA0Z)

Morbid process, derangement or abnormality localised in the mouth or related tissues of the face

Coded Elsewhere: Structural developmental anomalies of mouth or tongue (LA31)
Symptoms or signs of the orofacial complex (MD80)
Jaw pain (ME86.9)

DA00 Disorders of lips

A group of any derangement or condition effecting the normal structure and function of the lips resulting from developmental or traumatic factors or systemic disease.

Coded Elsewhere: Lichen planus of lips (EA91.Y)

DA00.0 Cheilitis

Cheilitis is the generic term given to inflammatory conditions of the lip.

Coded Elsewhere: Actinic cheilitis (EK90.Y)

DA00.1 Self-induced lip trauma

Self-inflicted damage to lips by biting, picking, chewing etc.

Coded Elsewhere: Artefactual cheilitis (ED00)

DA00.2 Pigmentary abnormalities of lips

This is an abnormality in the material that changes the colour of reflected or transmitted light as the result of wavelength-selective absorption, of the lips.

DA00.3 Lip fissure

DA00.Y Other specified disorders of lips

DA01 Disorders of oral mucosa

Inflammation of the soft tissues of the mouth, such as mucosa; palate; gingiva; and / or lip, as well as any associated any pathological or traumatic discontinuity of tissue

Exclusions: Noma (DA0C.31)
gangrenous stomatitis (1C1H)
Cheilitis (DA00.0)
cancrum oris (DA0C.31)

Coded Elsewhere: Lichen planus and lichenoid reactions of oral mucosa (EA91.4)
Oral submucous fibrosis (DA02.2)
Oral allergy syndrome (EK10.0)
Contact gingivostomatitis (DA02.3)
Neonatal disorders of the oral mucosa (KC23)

DA01.0 Disturbances of oral epithelium

Coded Elsewhere: Cheek-biting (6B25.Y)

DA01.00 Leukoplakia

Leukoplakia is a condition where areas of keratosis appear as adherent white patches on the mucous membranes of the oral cavity. Leukoplakia may affect other gastrointestinal tract mucosal sites, or mucosal surfaces of the urinary tract and genitals.

Inclusions: Leukoplakia of gingiva

Exclusions: Hairy leukoplakia (DA01.01)

DA01.01 Hairy leukoplakia

Oral hairy leukoplakia is a focal epithelial hyperplasia of the oral mucosa associated with Epstein-Barr virus. It is closely associated with HIV and occurs in both immunocompromised and immunocompetent HIV-infected individuals. It is also, however, found in uninfected people who are immunosuppressed, e.g. organ transplant recipients. It presents as white patches with a corrugated or hairy appearance affecting particularly the lateral borders of the tongue.

DA01.02 Wandering rash of the mouth

The counterpart of geographic tongue affecting other parts of the oral epithelium. It is less common than geographic tongue.

DA01.0Y Other specified disturbances of oral epithelium

DA01.1 **Noninfectious erosive or ulcerative disorders of oral mucosa**

A group of erosive and ulcerative disorders of oral mucosa without infection.

Coded Elsewhere: Oral pemphigus (EB40.00)

Stevens-Johnson syndrome (EB13.0)

Pyodermatitis–pyostomatitis vegetans (EL3Y)

Lupus erythematosus of oral mucosa (4A40.Y)

DA01.10 Oral aphthae or aphtha-like ulceration

This is a frequent small, shallow, painful ulcerations in the oral mucosa. Recurrent oral ulceration that clinically resembles recurrent aphthous stomatitis but presents atypically, including commencement after adolescence, with fever, with a strong family history, or failing to resolve with age.

Coded Elsewhere: Oropharyngeal ulceration due to Behçet disease (4A62)

DA01.11 Oral mucositis

Ulcerative mucositis is the inflammation of the oral mucosa with inflammation, ulceration and frequently with bleeding.

DA01.12 Chronic ulcerative stomatitis

Chronic ulcerative stomatitis (CUS) is a rare disease which presents with chronic oral mucosal erosions and ulceration resembling erosive lichen planus but refractory to standard therapies. It typically occurs in older women. Diagnosis requires the demonstration of speckled granular perinuclear IgG deposits in the basal and parabasal layers of oral epithelium (stratified epithelium-specific antinuclear or SES-ANA pattern). There is increasing evidence that CUS is an autoimmune disease provoked by circulating IgG antibodies directed against delta-Np63, an isoform of the p53 family of nuclear transcription factors which is present around the nuclei of normal oral epithelial basal keratinocytes. CUS normally responds to treatment with hydroxychloroquine.

DA01.13 Erythema multiforme with oral ulceration

This is a skin condition of unknown cause, possibly mediated by deposition of immune complex (mostly IgM) in the superficial microvasculature of the skin and oral mucous membrane that usually follows an infection or drug exposure.

DA01.14 Drug-induced oral ulcer

Ulceration of the oral mucosa attributable to medication. Non-steroidal anti-inflammatory drugs (NSAIDs) and cytotoxic drugs such as methotrexate and n are well recognised causes but many others have been incriminated.

DA01.15 Mouth ulcers

Oral ulceration of other specified or unspecified type.

Exclusions: Mechanical oral ulceration (DA01.1)

Drug-induced oral ulcer (DA01.14)

DA01.1Y Other specified noninfectious erosive or ulcerative disorders of oral mucosa

DA01.2 **Granuloma or granuloma-like lesions of oral mucosa**

This is a specific type of chronic inflammatory response of the oral mucosa characterised by a localised accumulation of epithelioid macrophages, multi nucleate giant cells, and lymphocytes.

Inclusions: Denture granuloma

Coded Elsewhere: Sarcoidosis of oral cavity (4B20.Y)

Crohn disease of lips or oral mucosa (DD70.0)

DA01.20 Giant cell granuloma, central

A benign condition of the jaws. It is twice as likely to affect women and is more likely to occur in individuals between the age of 20 and 40. Central giant cell granulomas are more common in the mandible and often cross the midline.

Exclusions: peripheral giant cell granuloma (DA0D)

DA01.21 Orofacial granulomatosis

Orofacial granulomatosis (OFG) is an uncommon clinicopathological entity characterised by persistent and/or recurrent lymphoedema and fissuring of the lips and oral mucosa (the latter resulting in a "cobblestone" appearance), oral ulceration and the presence on biopsy of non-caseating granulomas. OFG may be an early manifestation of Crohn disease, sometimes presenting months or years before bowel disease. Some cases are associated with dental infections, sarcoidosis, food allergy or contact allergy. Granulomatous cheilitis is a form of OFG confined to the lips. Rarely, OFG may be associated with fissured tongue and facial palsy (Melkersson-Rosenthal syndrome).

Coded Elsewhere: Granulomatous cheilitis (DA00.0)

DA01.2Y Other specified granuloma or granuloma-like lesions of oral mucosa

DA01.3 **Infections of lips or oral mucosa**

A group of conditions characterised by the invasion of lips and oral mucosa by harmful organisms (pathogens), such as bacteria, fungi, protozoa, rickettsiae, or viruses.

Coded Elsewhere: Enteroviral vesicular stomatitis (1F05.0)

Enteroviral vesicular pharyngitis (1F05.1)

Candidosis of lips or oral mucous membranes (1F23.0)

Warts of lips or oral cavity (1E82)

Angular cheilitis due to bacterial infection (DA00.0)

DA01.30 Cellulitis or abscess of soft tissues of the mouth

Infection of the soft tissues of the mouth resulting in cellulitis and/or abscess formation.

Exclusions: Peritonsillar abscess (CA0K.1)

Abscess of salivary gland (DA04.3)

Periapical abscess without sinus (DA09.62)

Periapical abscess with sinus (DA09.61)

Periapical abscess with facial involvement (DA09.60)

Coded Elsewhere: Abscess of periodontium (DA0C.4)

DA01.3Y Other specified infections of lips or oral mucosa

DA01.4 **Irritative hyperplasia of oral mucosa**

Exclusions: irritative hyperplasia of edentulous ridge [denture hyperplasia] (DA0D.2)

DA01.40 Papillary hyperplasia of oral mucosa

This is an oral pathologic condition that appears in the mouth as an overgrowth of tissue usually beneath a denture and is associated with poor denture hygiene, denture overuse, and ill-fitting dentures.

DA01.41 Denture hyperplasia

DA01.42 Oral fibroepithelial polyp

DA01.4Z Irritative hyperplasia of oral mucosa, unspecified

DA01.Y **Other specified disorders of oral mucosa**

DA02 Miscellaneous specified disorders of lips or oral mucosa

Exclusions: Diseases of tongue (DA03)

Cysts of oral or facial-neck region (DA05)

Certain specified disorders of gingiva or edentulous alveolar ridge (DA0D)

Coded Elsewhere: Drug-induced oral conditions (EH74)

DA02.0 **Genetic or developmental disorders involving lips or oral mucosa**

A group of genetic and developmental disorders characterised by abnormal facial development that particularly involves the lips and oral mucosa.

Coded Elsewhere: Chronic mucocutaneous candidosis (1F23.14)

Peutz-Jeghers syndrome (LD2D.0)

Hereditary haemorrhagic telangiectasia (LA90.00)

Pachyonychia congenita (LD27.Y)

Cowden syndrome (LD2D.Y)

Dyskeratosis congenita (3A70.0)

Heterotopic sebaceous glands of lips (ED91.0)

Heterotopic sebaceous glands of oral mucosa (ED91.0)

DA02.1 **Xerostomia**

Dry mouth. This may result from many causes including dehydration, salivary gland dysfunction, suppression of saliva production by drugs (e.g. anticholinergics) or habitual mouth-breathing.

DA02.2 **Oral submucous fibrosis**

DA02.3 **Contact gingivostomatitis**

Inflammation of the gingivae and oral mucosa due to contact with irritants or allergens but without specification of which mechanism is involved.

DA02.30 Allergic contact gingivostomatitis

Allergic contact dermatitis affecting the gingivae and oral mucosa.

DA02.31 Irritant contact gingivostomatitis

Inflammation of gingivae and oral mucosa due to contact with irritants.

DA03 Diseases of tongue

Any pathological process effecting the structural tissues of the tongue with or without interference of its normal functions.

Exclusions: leukoplakia of tongue (DA01.00)
erythroplakia of tongue (DA01.0)
leukoedema of tongue (DA01.0)
Hairy leukoplakia (DA01.01)
submucous fibrosis of tongue (DA02.2)
Ankyloglossia (LA31.2)

Coded Elsewhere: Sublingual varices (BD75.0)

DA03.0 Glossitis

Inflammation of the tongue

Exclusions: atrophic glossitis (DA03.2)

DA03.1 Geographic tongue

A condition characterised by migratory glossitis and loss of dorsal papillae with a map-like appearance that gives origin to the name.

Inclusions: Benign migratory glossitis
Glossitis areata exfoliativa
Erythema migrans of tongue

DA03.2 Atrophy of tongue papillae

Inclusions: Atrophic glossitis
Central Papillary atrophy of the tongue

DA03.3 Median rhomboid glossitis

DA03.4 Hypertrophy of tongue papillae

Inclusions: Hypertrophy of foliate papillae

DA03.5 Macroglossia

Macroglossia is the medical term for a large or enlarged tongue. It may be due to a variety of congenital and acquired conditions. Isolated macroglossia has no determinable cause. It is seen commonly in Down syndrome. The most common causes of tongue enlargement are vascular malformations (e.g. lymphangioma or haemangioma) and muscular hypertrophy. It may, however, be due to infiltration, as with primary systemic amyloidosis.

Coded Elsewhere: Congenital macroglossia (LA31.0)
Macroglossia due to primary systemic amyloidosis (5D00.Y)

DA03.Y Other specified diseases of tongue

DA04 Diseases of salivary glands

A group of diseases with any pathological condition that affects the structural tissues of the salivary glands or the salivary ducts which may or not interfere with the normal production and transport of saliva into the oral cavity.

Coded Elsewhere: Aplasia of lacrimal or salivary glands (LA14.10)

Uveoparotid fever (4B20.Y)

DA04.0 Atrophy of salivary gland

Salivary gland atrophy is a wasting or decrease in size of salivary gland, which is not sufficient to cause necrosis. It may occur in response to poor nutrition, lack of use (disuse or immobilization), reduction in blood supply, loss of nerve supply, chronic cell injury, or ageing etc. It is including Sjögren's syndrome, irradiation therapy and obstructive sialadenitis.

DA04.1 Hypertrophy of salivary gland

DA04.2 Sialoadenitis

Sialoadenitis (or Sialadenitis) is an inflammation of the salivary gland. It is often associated with pain, tenderness, redness, and gradual localised swelling of the affected area.

Exclusions: epidemic parotitis (1D80.0)

Uveoparotid fever (4B20)

DA04.3 Abscess of salivary gland

This is a collection of pus (neutrophils) that has accumulated within the salivary gland because of an inflammatory process in response to either an infectious process (usually caused by bacteria or parasites) or other foreign materials.

DA04.4 Sialolithiasis

Sialolithiasis is a condition where a calcified mass forms within a salivary gland, usually in the duct of the submandibular gland. The usual symptoms are pain and swelling of the affected salivary gland, both of which get worse when salivary flow is stimulated.

Inclusions: Calculus of salivary gland or duct

Stone of salivary gland or duct

DA04.5 Mucocele of salivary gland

This is a clinical term used to describe a bluish, soft, often fluctuant swelling caused by either blockage or rupture of a salivary gland duct.

DA04.6 Disturbances of salivary secretion

A group of conditions characterised by an increase or decrease in saliva secretion.

Exclusions: Dry mouth (DA02.1)

Coded Elsewhere: Xerostomia due to disturbance of salivary secretion (DA02.1)

DA04.7 Sialophagia

Excessive swallowing of saliva

DA04.8 **Sialoschesis**

Suppression of the secretion of saliva.

DA04.Y **Other specified diseases of salivary glands**

DA04.Z **Diseases of salivary glands, unspecified**

DA05 **Cysts of oral or facial-neck region**

Cysts of oral or facial-neck region, having a distinct epithelial lining and division compared to the nearby tissue, which may contain air, fluids, or semi-solid material.

Exclusions: Radicular cyst (DA09.8)

Coded Elsewhere: Epstein pearl (KC23)

DA05.0 **Developmental odontogenic cysts**

Cysts derived from odontogenic (tooth forming) tissue, usually containing fluid or semisolid material, which develop during various stages of odontogenesis.

DA05.1 **Developmental nonodontogenic cysts of oral region**

Cysts that arise from non-odontogenic (non-tooth forming) tissue. By definition, the cysts are lined by epithelium. These cysts include for example; nasopalatine duct cyst, palatal cyst of the neonate, globulomaxillary cyst and more.

DA05.Y **Other specified cysts of oral or facial-neck region**

DA05.Z **Cysts of oral or facial-neck region, unspecified**

DA06 **Certain specified diseases of jaws**

A group of diseases which are associated with the jaws and which are not classified elsewhere.

DA06.0 **Inflammatory conditions of jaws**

Exclusions: Cervicofacial actinomycosis (1C10.2)

DA06.1 **Alveolitis of jaw**

Inflammation of the alveoulus

Inclusions: Alveolar osteitis

Dry socket

DA06.2 **Exostosis of jaw**

Formation of bone mass on the vestibular, buccal or facial side of the maxilla or the mandibular jaw where it may affect the lingual aspect; exostoses are more frequent in the maxillary bone.

DA06.3 **Stafne mandibular bone cavity**

Although commonly called a Stafne cyst, this entity is not a true cyst but rather a cavity due to a focal cortical defect of the medial aspect of the mandible. It is found most frequently in middle-aged men and is usually discovered radiologically as an incidental finding. Its importance is that it may be difficult to distinguish from other radiolucent lesions in the mandible such as myeloma or metastatic squamous carcinoma. The cavity is usually filled by part of the submandibular salivary gland or adjacent fat and it is thought to result from remodelling of the bone by adjacent salivary tissue. Stafne cysts are most frequently seen in middle-aged men. The estimated prevalence ranges around 0.10-0.48% 2. Pathology Stafne cysts are thought to result from remodelling of the bone by adjacent salivary tissue, and have been noted to regress following resection of the gland nearby. They generally appear in the area between the mandibular first molar and the mandibular angle 6.

DA07 Disorders of tooth development or eruption

Alteration of the normal formation process of the tooth, the normal chronology of eruption into the mouth or the proper alignment in the dental arch affecting a single or multiple teeth.

Inclusions: disorder of tooth development

Coded Elsewhere: Anodontia (LA30.0)

Hypodontia (LA30.1)

Oligodontia (LA30.2)

Hyperdontia (LA30.3)

Abnormalities of size or form of teeth (LA30.4)
